ntmost care in affording water; therefore, it is not good practice to dip the plants or otherwise saturate the compost, but rather to lightly sprinkle the moss and the sides of the baskets, to which generally the roots cling. Very small plants of these species produce flowers, but it is not advisable to pinch out the flower-spikes if the plants are healthy, with the object, may be, of getting them quickly into a stronger condition; because they will invariably send up other flower-spikes, greatly to the detriment of the plants. It is far better to let the first blooms fully expand, and then remove the spike, keeping the plant so treated dormant till the proper growing season commences. Specimens with long flower-spikes must not be kept too close to the roof of the bonse, or the end of the spikes may decay by reason of the cold air passing between the laps in the glass. All of the green-leaved varieties, as P. Marie. P. tetraspis, P. violacea, P. Luddemanniana, &c., should be carefully protected from the sun's rays even during the winter. If the summer shadiogs have been removed, these species should be so placed that they may be permanently shaded by plants with large foliage.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

General Operations. - During mild weather the principal work will consist of transplanting deciduous species of trees and sbrubs, and during weather unsuitable for outside work of most kinds, the collecting and burning of garden-refuse, trimmings, &c., may be proceeded with, the ashes from which form an excellent dressing for lawns in poor condition, or for flower-beds and borders. Garden walks should now be turned or otherwise dealt with so that the surface may be bright, smooth, and hard. It is very essential that the catch-pits, gratings, and grips for conveying surface-water away are put in good order, otherwise water will pass through the gravel, making it soft, and untit for walking upon for a long time after rain has ceased to fall, or it will cause runnels in the surface and much labour in putting matters right. The grating laid over catch-pits need not be large, unless the walks are very broad, and the descent rapid, otherwise they are too conspicuous, a suitable size for an ordinary walk being 6 inches square. The pits beneath the gratings should be of brick, and carried 6 inches lower than the drain-pipes.

Bedding plants, such as Violas, Verbenas, Calceolarias, Antirrhinums, &c., should be fully exposed to the air during mild weather, removing the lights or other coverings altogether. Bedding Pelargoniums should be very carefully afforded water, and decaying leaves and flower-stems should be promptly removed, otherwise the plants themselves may decay, especially if they are being wintered in fruit houses, to which artificial heat cannot be afforded them for a time.

Dablius.—The roots should now be lifted without injuring them more than can be helped, and laid out to dry before storing them away; the stems should be cut down to within 6 inches of the tubers. The labels should be fastened to the tubers with fine copper wire or stout string, not to the stem, the latter almost invariably becoming detached from the root when thoroughly dry. The roots will pass safely through the winter if stored in a dry cool house or shed, where frost can be excluded.

Roses in masses, and of one variety, are seen to greater advantage than beds consisting of many varieties, or when planted in straight lines or rows. Those who have adopted the former style of planting, either of H. P. or Teas, will be aware of the gain in a finer display of colour. Although such varieties of H. P. as La France, Captain Christy, Alfred Colomb, Paul Neyron, and others, are excellent for this object, yet the hardier varieties of Teas appear to be more suitable in most gardens, succeeding as they do in light soils, and being to a greater degree proof against mildew, and more continuous flowerers than the H. P. varieties, and not losing their foliage so soon as the latter. Should the weather be severe, some loose litter or bracken should be distributed among the plants. One of the best rose-coloured varieties for bedding is Madame Lambard, and although it varies in colour, it must still be classed as one of the best, and especially as this colour in Teas is somewhat scarce. It is of hardy constitution, free in growth, and a good bloomer. Among the light-coloured varieties, Marie Van Houtte is one of the best, resisting mildew, and of good habit for massing; its pale lemon-yellow blooms are acceptable in all stages of growth, being useful for a

variety of purposes. Of the flesh or bronzy-roso coloured varieties, Anna Olivier must have the first place, this variety being of splendid growth, very free-flowering, and hardy. As to pruning, this last-named Roso does not seem to be at all particular, as flowers are freely produced under any circumstances. Perle dex Jardins is a good yellow variety, but it cannot always be depended upon unless the situation is somewhat sheltered. Madame Hoste, Jean Ducher, Hon. Edith Gifford, Catherine Mermet, and Madame de Watteville are desirable varieties, of vigorous growth and habit.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highetere Castle, Newbury.

Cucumber Plants.—The application of water must now be more sparing, just sufficient being afforded to keep the soil moist, acrial moisture being obtained by sprinkling the paths, walls, &c., every morning, and in the early afternoon when the day is bright. The water used should be not of less warmth than the temperature of the air of the house, the same holding good of soil employed for top dressing the bed from time to time. Afford a slight quantity of top ventilation when the weather is mild; maintain a night temperature of 70°, except during very cold or windy weather, when a fall of a few degrees may be allowed, which is better practice than heating the hot-water pipes too severely; the day temperature may range from 80° to 85° with sun-heat. Crop lightly, or the plants will be weakened. Keep the young growths regularly stopped, and be sure that thrips and other injurious insects are kept in cheek.

Pinc-apple.—The plants which are carrying fruits that will ripen early in the new year, which have attained full size, must not receive much water, nor, on the other hand, be kept very dry at the roots. Each pot should be examined once a week, and if water be needed, enough should be applied to keep the soil moist, but not wet. When the fruits begin to colour, especially the Smooth Cayenne, withhold water altogether, or the fruits may become black at the core, more particularly if kept for a while after becoming ripe. Keep the temperature of the fruiting-stove about 70° by day, giving a small amount of air when it can be kept at that height with sunshine. The bottom-heat should be steady at 85° to 90°, and do not let the air become parchingly dry, which it is apt to do now that more artificial heat has to be used, but sprinkle the paths, &c., and other surfaces frequently, not wetting the hot-water pipes. If any of the late varieties show signs of starting into fruit, the plants should be placed by themselves where a little higher and moister temperature and bottom-heat of 85 to 90° can be afforded. Keep them from getting dry at the root, but do not overwater them.

Successions.—Plants intended to start into fruit in early spring should be kept somewhat cool and dry, 55° to 60° will be warm enough according to the state of the weather; and if these plants are plunged in deep beds of moist tau, or leaves, and not too near the hot-water pipes, they will require very little water for the next six weeks—but if plunged in shallow beds with hot water pipes close under them, water will be oftener required.

Suckers, if potted up in the early autumn, and well rooted at this date, should be kept quiet for the next two or three months, affording the pit liberal ventilation whenever the weather is favourable, with a night temperature not exceeding 60° when mild, and 5 less when cold and frosty. Merely afford enough water to keep the plants healthy. Recently-potted suckers in low, light pits may be kept 5 warmer, so that they make a little growth throughout the winter, affording them plenty of room, and also a little air daily whenever possible. During frosty nights a covering of mats or Frigi-domo over the glass, where it can be applied, is a great help in keeping an uniform temperature, and much better for the plants than hard firing.

CAMPANULA ROTUNDIFOLIA.—Surprise is often expressed at the name given to this Hare-bell, inasmuch as the rounded leaves are frequently not to be seen. In fact, they perish early, leaving only the linear-lanceolate leaves visible. Gebell, according to a note in the Botanical Gazette, has been enabled, by diminishing the light, to cause the shoots to produce round leaves exclusively until more strongly illuminated, when they form long leaves.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE FAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY. Nov. 14-Royal Botanic Society Meeting. SUNDAY, Nov. 15 Ghent Chrysanthenium Show. Chester Paxton Society's Fruit and Chrysanthemum Stand Chrysanthemum Show, Chrysanthemum Show at Birken head. TUESDAY. Nov. 17 WEDNESDAY, Nov. 18 Chrysanthemum Shows at New-eastle, Bristol, and York (York Florists). Nov. 19 Chrysanthemum Shows at Edin-THURSDAY, burgh, Barnsley, & Leamington. Nov. 20 Chrysanthemnm Shows at Man-chester Town Hall, and at FRIDAY. chester Town
Alderley Edge. SALES. (Dutch Bulbs at Protheroe & Morris Rooms.)

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.-41'9'.

WE had the pleasure last week Camoensia of recording the simultaneous maxima. flowering of this noble tropical climber at Kew, in the gardens of Mrs. WIN-THROP, Barton Court, Hungerford, and in those of Mr. WOODALL, of Scarborough. It was intreduced into cultivation by Mr. WM. BULL, and flowered for the first time in this country in the garden of Mrs. Ruddle, The Mythe, Tewkesbury; see Kew Bulletin, 1894, p. 402; Gard. Chron., January 12, 1895, p. 44. It also flowered in 1882 in the Trinidad Botanic Garden, and in 1894 in the Peradenyia Botanic Garden, as we mentioned last week, but it was not till a few days ago that we had the opportunity, thanks to Mr. Bull, of seeing the flowers which were produced in the garden of Mrs. Winthrop, Hungerford (gr., Mr. Conn), and from which the accompanying illustrations (fig. 105, p. 597, and fig. 106, p. 601) were taken.

The plant upon which this genus was founded was discovered in Angela by the late Dr. Wellwitsch when in the Portuguese service, and by him, in was in consequence, named after the famous Lusitanian poet. The genus was adopted by Mr. Bentham in the Genera Plantarum, and was more fully described by him in the Transactions of the Linnean Society, with a beautiful illustration by Fitch, taken from the dried specimens.

It is a climbing shrub, "common in dense forests of the Golungo alto, adorning the loftiest trees of the outskirts with its splendid bunches of pendulous milk-white flowers, tinged with gold on the edge of the petals" (Welwitsch).

The specimen before us is slightly puberulous, with long-stalked tri-foliolate acuminate leaves, minute stipules, and close racemes of flewers, which, under cultivation, are erect rather than pendulous, as originally described and figured, but which, when growing over tall trees, as described by Dr. Welwitsch, might well be pendent, as he describes them. The inflerescence and outer portion of the calyx are thickly covered with dense, felted, coarse brown hairs. The bracteoles are about half an inch long, lanceolate, deciduous. The calvx-tube, measuring about 2 inches in length, is leathery, cylindric, curved, dividing into a relatively short, irregularly five-lobed limb, of which the thick segments are imbricate in the bud. The five petals, which are twice the size of the calyx, spring from the threat of the calvx, all have long, white, narrow stalks, and all expand above into a spoon-shaped limb, somewhat papery in texture, plicate and crumpled in the bud, reticulate in venation, and edged with a narrow border of rich orange or yellow, which Mr. WOODALL describes as tipped with gold lace, so delicate and fairy-like is the frilled edging. The uppermest petal, or standard, is much larger than the others, and has the inner surface of the disc as well as the margins flushed with yellow. The side-petals or wings are at lirst upright and rigid within the standard, but as the artist remarked while making his sketch, they are endowed with elasticity when touched by the pencil, and after the discharge of the pollen they become drooping. The two lower petals and the stamens are also at first quite rigid, but subsequently fall. The snow-white stamens are shorter than the petals, ten in number, forming a tube at The narrow the base, filamentous above. angular ovary is stalked, its stalk adherent to the tube of the calyx for its lower half The cylindric style is slightly hairy at the upper part, and terminates in a green, cushionshaped stigma.

The flowers have a delicate fragrance, which has been compared to that of Vanilla. The yellow colour of the edge of the petals is apparently due to the presence of a colouring matter in the four or five rows of cells nearest to the margin. These at the extreme edge are raised into pimple-like elevations, whilst those on the surface of the disc of the petal are flat and sinuous in outline, containing in some cases oil in small quantities and minute starch grains, or some substance faintly coloured blue by iodine.

The thin texture of the petals causes them to be fugacious, and the golden rim which is so beautiful an adornment to the frilled edge very soon turns to a dirty brown. These circumstances detract greatly from the value of the flower in a gardener's eyes, but it must be remembered that the flowers are in clusters and open in succession, and that when grown

as seen by Welwitsch in Angola, they no doubt amply justify his eulogium.

The full botanical details relating to this fine climber are given in the works cited in the foot note. The illustrations by Mr. Worthington Smith, figs. 105, 106, with the notes here given, preclude the necessity of further description; but the following particulars extracted from the communications with which Mr. Watson, Mr. Conn, and Mr. Woodall have favoured us will be read with interest:—

Mr. Conn has his plant growing in a small bed 15 inches across, 30 inches long, and 22 inches deep. The compost consists of loam, with a little peat and charcoal intermixed. In this the plant makes strong growth. Mr. Conn has five heads of bloom, which are erect. Mr. Conn adds that it is really a magnificent climber, with its large deep green leaves.

Mr. Woodall says:-

"Mr. Thiselton Dyer kindly gave me a young plant three years ago, which I planted out when big enough, in a stove border, where it is now in flower. There are two large bunches of its large but sadly flimsy and evanescent white flowers open. It is deliciously fragrant, and were it only less short-lived would be well worth growing; as it is, the flower seems hardly to last six hours, and its milky-white colour is not relieved by any other shade or tone. The foliage and growth of Camoensia maxima is so fine, that it is to be regretted its enormous flowers are of so little value from a gerdening point of view."

Mr. Watson writes:—

"The flewering of this plant simultaneously in three gardens in England is an event of some interest, seeing that it has been in cultivation since 1873, when ceeds of it were sent to Kew by Mr. J. MONTEIRO, of Angola. The first record of its having flowered under cultivation was in 1882, when a plant bloomed in the Trinidad Botanic Garden, then under the superintendence of Mr. H. PRESTOE. The Kew plant has developed several racemes, one of which has been cut to be figured in the Botanical Magazine, and afterwards to go into the herbarium; a second raceme will be at its best in a few days, and there are others less advanced. The racemes are terminal on ripened branches, and they are erect (not drooping, as hitherto believed). It may be said at once that the Camoensia is not likely to be of any value as a market plant; at the same time it is one of the most beautiful of all tropical Leguminosie, and where room can be afforded for it, no plant has a stronger claim upon those who love flowers that are truly beautiful Mr. Monteiro, to whom we are indebted for the introduction of this and many other African rarities sent by him at different times to Kew from Angola, thus writes of the Camoensia in his interesting book Angola and the River Congo (Macmillan, 1875):-'It was at Quiballa (a large town situated on a low flat-topped hill on the northern limit of Angola) that we were so fortunate as to obtain specimens of the flowers, and a quantity of ripe seeds of the beautiful plant, named Camoensia maxima by its discoverer, Dr. Welwirsch. We saw it growing along the sides of the road as soon as we left the goeiss formation and entered on the mica slate; but most abundantly in the more bare places on the sides of the hills at Quiballa, in the very hard clay of the decomposed mica slate.

"The Camoensia grows as a hard, woody bush, with rather straggling long branches, covered with fine large leaves, and hearing bunches of flowers... Its roots spread underground to great distances, and shoot out into other plants, so that, on attempting to remove what we thought were nice small plants, we always came on great thick roots, which we followed and found to proceed from old bushes at a considerable distance... Half-a dozen of the seeds germinated on arrival at Kew Gardens, so that I hope this lovely flower will be shortly in cultivation, a welcome addition to our hothouses.'

"At Kew, the plant behaves exactly as described in the above extract, the bed in which it is planted

^{*} Camposia marcona, Welwitsch, ex Bentham in General Plantacena, i., 557 (1865), and in Transactions of the Linneau Society, vol. xxv., 1866, p. 302, tab. 26.

Fig. 105.—camoensia maxima: portion of inflorescence, and milk-white flowers, with a failled edge of gold colour. (see p. 596.)

being a mass of thick woody roots, from wheuce numerous suckers spring. These, however, are not allowed to grow, the specimen being limited to about five stems, the thickest being now nearly 2 inches in diameter, and very hard. The longest shoots are about 12 feet in length, and they are almost wholly clothed with bright green trifoliate leaves. New shoots are developed freely all over the plant, and to keep it from becoming a thick tangle, many of these are removed annually. It is planted in a hot, moist stove in a raised border of rich well-drained loamy soil, below which there are several hot-water pipes. The stems are trained on wires close to the roof of the house, which is somewhat flat, and faces due south. During bright sunshine the house is shaded with an ordinary canvas-blind. This plant has been in this position for about ten years, and all sorts of experiments have been made to induce it to flower; but although it has always grown most vigorously, it has never shown any signs of flower before this year. Plants tried in the large Palm-house and other tropical houses, including the Succulent-house, were not so successful. If planted in a suitable position in a tropical garden this plant would soon cover an enormous area. We intend to put in cuttings of the branches which are now in flower, in the expectation that they will respond more readily to treatment for flowers than has been the ease hitherto. It would be interesting to hear if the plants in Trinidad and Ccylon have flowered regularly since they first yielded. Probably the exceptional amount of bright sunshine enjoyed in this country during the early part of the past summer had a great deal to do with the flowering of the Camoensia,'

LINNEAN SOCIETY.—An evening meeting will be held on Thursday, Nov. 19, 1896, at 8 P.M., when the following papers will be read:—I. "On the Structure and Development of the Hyobranchial Skeleton and Larynx in Xenopns and Pipa, with remarks on the Affinities of the Aglossa," by Mr. W. G. Ridewood, B.Se., F.L.S. 11. "Amphipoda from the Copenhagen Museum and other sources," by Rev. Thos. R. R. Stebbing, F.R.S., F.L.S.

HORTICULTURAL INSTITUTE.—The following letter needs no explanation. We have others relating to the same subject which we shall publish later on :—

"The representations contained in my letter, which appeared in the last issue of the Guedhairs' Chronicle, have received the strongest support, by the remarks made at the barquet of the Chrysanthemuo Society on November 3, by Sit Trevor Lawresce and F. A. Bryan, Esq. These gentlemen deserve our best thanks for their outspoken disapproval of existing arrangements, and the note of encouragement they have given for united action thanks for the establishment of a Home of Horticulture. The time is ripe for prompt action, and this era in our nation's history cannot be more suitably celebrated than by the imanguration of such an institution. Will you kindly grant space in your columns for correspondence upon this most important question, viz., the establishment of a Hone of Horticulture, with a view of convening a meeting at an early date to devise ways and means?—Jaues L. Wood, Oakleigh Park, Whetstone."

THE THREATENED SCARCITY IN INDIA.—We understand that the Secretary of State for India has shipped some thousands of sacks of vegetable seeds suitable for growing in the districts of Northern India that are threatened with scarcity. The selection, packing, and shipping were accomplished by Messrs. Cauters, the Queen's seedsmen, London, in the short space of nine days.

ROYAL HORTICULTURAL SOCIETY OF IRE-LAND.—At the Chrysanthemum and fruit show of the Royal Horticultural Society, which opened at Ball's-bridge, Dublin, on Wednesday afternoon, November 4, the exhibits shown as not for competition included a collection of fruit, consisting of nearly 200 dishes from the Royal gardens at Frogmore. Her Majesty's head gardener went over specially to see the fruit staged, and Her Majesty directed that at the close of the show the fruit should be sent to the Hospital for Incurables at Domybrook for distribution among the inmates.

BIRMINGHAM AMATEUR GARDENERS' ASSOCIATION. The above association held its second annual Chrysauthemum showat the Technical School,

on the evening of Nov. 6. Councillor R. F. Martineau (Vice-president) occupied the chair, and there were also present Messrs. J. W. Oliver (Vice-president), R. F. Rees (hon. Treasurer), W. B. Griffin (hon. Secretary), Hy. Hill, &c. The exhibits were far more numerous than last year, but on account of the early date and the rather unfavourable scason, the flowers were not so large nor so good in colour as in average seasons. Messrs. W. H. Peake and J. Miller both exhibited some excellent stands, the former taking no fewer than three firsts.

STOCK-TAKING: OCTOBER.—Much disarrangement of trade has been caused by the Presidential campaign in the United States, and a bad influence has been exercised on our markets by the imminence of a famine in India, and bad harvests in Australasia and Russia. The top price of Wheat went up some 10s., other qualities sharing proportionately in the advance. The Presidential campaign has ended, as all know, and business men are now engaged making up for lost time, so that we may expect the Board of Trade Returns for November to show a much better state of trade than is indicated by the Returns now under notice, good though they are in their totals. The following is our usual extract from the "summary" table of imports for the past month:—

1mports,	1895.	1896.	Difference.
Total value	£ 311,850,868	£ 39,576,290	+2,716,122
(A) Articles of food and drink duty free	12,411,811	13,601,415	+1,219,604
(B.) Articles of food and drink dutiable	2,832,950	3,295,672	+462,722
Raw materials for textile manufactures	4,037,542	5,167,994	$\pm 1.130,453$
Raw materials for sundry industries and manufactures	4,528,819	4,548,091	+19,272
(A.) Miscellaneous articles	1,254,295	1,385,402	+131,107
(B.) Parcel Post	78,958	93,540	+14,582

The increase in the imports of duty-free articles of food is very significant, and in the section devoted to Corn we note that Wheat has gone up by 694,320 cwt.; Oats by 646,190 cwt.; Maize by 1,671,920 cwt. Increased imports are also to be noted in mctals, viz., £60,899; in Tobacco, of £137,179. In fruits, roots, and vegetables, we have the following entries:—

IME	ORTS.		1895.	1896.	Difference	
Fruits, raw	:-					
Apples		bush	479,121	1,602,403	$\pm 1,123,282$	
Cherries		,,				
Plums		,,	23,756	9,242	14,514	
Pears		*** **	40,093	38,255	-1,838	
Grapes		,,	346,418	298,242	- 48,176	
Unenume	rated	,,	114,990	115,381	+391	
Onions		,,	745,237	786,991	+41,751	
Potatos		ewt.	62,808	25,036	-37,767	
Vegetables, merated	raw,	unenu- value	£74,820	£77,081	+£2,261	

The extraordinary figures relating to Apples are accounted for by the fact that America has sent £257,000 in excess of that recorded previously. The total imports for October foot up at £39,576,290, against £36,859,868 for the same period last year—a gain of £2,716,422. The imports for the ten months of the present year show a total of £355,926,761 against £310,752 582 for the same months in 1895—a gain of £15,174,179.

THE EXPORTS

for the month amount to £20,654,997 against £20,828,866 in October, 1895—a decrease of £173,869. The causes for the small decline are easily to be found—some of these being removed, we may look forward to an alteration in the totals in next month's returns. By the way, the exports for the past ten months show a total of £201,091,150, against £187,449,303 for the same period last year, an increase of £13,641,847.

Some consular agents have in time past sent home warnings concerning British commercial representatives abroad; the warning now is about having continental agents for British firms in foreign cities, where clerks develop into importers, to the loss of the trusting exporter. Who is the fitting man?

THE LAND OF THE DRAGON TREES.—Dr. Morris has been lecturing on this subject before the members of the Richmond Athenaum. The lecturer descanted on the appearance and history of the famous Dragon tree, of which we believe the only authentic illustration appeared in our columns, p. 765, vol. for 1872, those given in other works being artistic representations made from memory or from imperfect material. The Thanes Valley Times, of Nov. 4, contains a full report of the lecture, which was illustrated by lantern slides.

CHRYSANTHEMUM TYPES.—The last number of the Florists' Exchange contains an article on this subject from the pen of Mr. Leonard Barron, accompanied by illustrations. Mr. Barron adopts the following groups:—Incurved Chinese, Incurved Japanese, Reflexed Chinese, Reflexed Japanese, Pompons, Anemone-flowered, Singles, with various minor sub-divisions.

CHRYSANTHEMUMS AT RAVENSCOURT PARK, HAMMERSMITH.—Now that at many of the parks' under the control of the London County Conneil special structures are erected for these popular, flowers, the hint might be taken to do something of the kind at Hammersmith, where the flowers are grown (creditably enough under the circumstances) in an antiquated conservatory—quite unfit for cultural purposes, and heated by an oil-lamp.

TO MATURE UNRIPE TOMATOS.—According to M. Chemin in the Annals of the Horticultural Society of the Department of Haute-Marne, the following simple expedient suffices to ripen off a crop of Tomatos. If the weather has been unfavourable for ripening of the fruit, the plants should be pulled up when the most of the fruits have reached full size, and laid horizontally on a layer of clean straw in a sunny place, and without any further trouble the fruits become completely ripe, and retain their peculiar fine flavour. In this country, we do much the same kind of thing, with the difference that the plants are put under some kind of glass protection.

HOME CORRESPONDENCE.

APPLEY TOWERS GRAPE.—Anent this Grape, an article upon which appeared from the pen of "A.D." in your issue of the 3rd inst., I may say that at the Fruit Show of the Horticultural Department of the Royal Agricultural and Horticultural Society of Jersey, held on the 15th ult., Mr. A. Davidson of Constantia Lodge, St. Clement's, Jersey, exhibited several well-finished bunches. Examples of this particular variety have on several occasions come under my notice when judging fruit, and I have thought little of its value as a market Grape; but the excellence of Mr. Davidson's exhibit has quite changed my opinion regarding it. During over twenty years' experience as judge at the shows held in this Island, I have never seen superior Grapes. This led me to seek an interview with the exhibitor, and I found that this gentleman a few years since purchased some Vines of the variety, and having several in his hou es for which he cared little, including Canon Hall white Muscat, white Gros Colmar, Barbarossa, Museat Hamburgh, and others, he inarched the variety Appley Towers upon them. He has it also on its own roots, and I was informed that the best bunches exhibited at the above show were cut from the Vines worked on the Canon Hall stock, while the fruit from that on the Muscat Hamburgh, and also from Appley Towers on its own roots are smaller in every way. Mr. Davidson is so impressed with the value of this Grape, more especially as to its cropping and colouring qualities, that he predicts in the near future that it will supersede in public favour one of its parents viz., Alicante, as also Gros Maroc and others of similar type. Another point in its tavour, and one not to be overlooked in such dry seasons as the pa t, is the fact that it withstands red-spider, so much so

that growing promisenously with other varieties, which were badly affected with it, the foliage of Appley Towers remained perfectly green. As to a description of the bunches exhibited at the above show, they were of fair size, averaging 2 lb. in weight; the berries were large, somewhat of the Gros Maroc shape, and the colour and bloom perfect. As in the case of Mr. Bowerman's Vines referred to by "A. D.," each bunch has a single shoulder, so that evidently this is a characteristic of the two varieties aid to have been raised from the same berry, viz. Lady Hutt and Appley Towers. P. F. L. S., Jersey.

GROS MAROC AND COLMAN GRAPES.-The idea of putting Gros Maroc before Colman is a novel oneat least, to northern gardeners. At exhibitions, in shops, for consumption in private families, Gros Maroc is mostly in bad repute; still, when the appearance of a Grape is the object, none is more beautiful than Gros Maroe, but their coarseness of pulp and ordinary flavour are much against it, and when purchasers have become acquainted with these defects, they ask for a more palatable variety. Gros Colman is semetimes objected to by owners of gardens, but this is because the fruit is sent to table before it is fully ripe; for my part I never cut them for dessert till they have hung six or eight weeks after they are fully coloured. Gros Maroc I have grown for many years, and have always found it to crop eapitally, and make strong canes and foliage, resisting attacks of disease and insects better than most varieties. Reverting to Gros Colman, it will be conceded that it takes more prizes during November at northern shows than any other Grape, and those persons who have seen the examples shown by Mr. Leslie, of Porth, which invariably take many of the leading prizes at Glasgow, Edinburgh, Dundee, Perth, and other places, will admit that these Grapes have few equals in the North. I also know how the fruit tastes, as I have often had to judge them. exhibits (not for competition) which have from time to time come from Clovenfords tell the same tale. I could grow them more easily in England than in Scotland by reason of the greater amount of solar heat enjoyed during the autumn months, but I can get them quite as well-flavoured in the north. Mr. Leslie has, in his vineries at the present time, as fine erops of Gros Colman as may be seen, and while there lately on a visit, I could not but admire his Grapes of all kinds. Museat of Alexandria and Alicantes were remarkably good, and I expect to see Mr. Leslie taking leading position at the shows. I have been to see another "northern champion," who took six 1st prizes at Edinburgh in September—I mean Mr. Ru herford, the gardener at Airthrey Castle, near the Gros Colman does not stand high Bridge of Allan. at Airthrey-Muscats, black Hamburgh, Duke of Buceleuch, and some others, are the varieties most appreciated there. It is more than probable that Gros Celman has not been fairly tested, that is, leaving them long enough on the Vines before cutting them for the table. A late vinery is being planted there (at Airthrey), and very probably Mr. Leslie may find a foeman worthy of his steel at late shows, as he has already found at the summer and autumn shows. Neither of these exhibitors crops lightly; still, the crops of Grapes they obtain are of finest quality. M. Temple, Curron, N.B.

- 1 was pleased to observe Mr. Turton's remarks on this fine Grapo, which has always been a favourite of mine, and if at any time I should have another opportunity of putting up vineries, I shall certainly endeavour to have house (not too large) especially for Gros Colman, as I consider it a kind of Grape worthy of high cultivation. Many persons find fault with its flavour, but proper treatment makes a wonderful difference, as does grafting the Vine on Black Hamburgh stock, which considerably improves the flavour. If Gros Colman had the good keeping qualities of Lady Downes, it would, no doubt, be mere commonly grown than it is. I do not know much concerning white Gros Colman, a variety which was raised a few years ago, and should be much obliged by a few remarks from any one of the readers of the Gardeners' Chronicle who may have grown and fruited it. 1. J. Long, Wyfold Court Gurdens.

— Your correspondent "Vinitor" lacked success in growing Gros Colman Grapes fit for the palate, as we learn from his letter in the Gardeners' Chroniele, contrary to his own interest he has become prejudieed against Gros Colman, as is evidenced by the many accusations that he brings against it. As I have always held a contrary opinion (my experience with it extending from 1873), I am sending herewith a bunch

of each of the two varieties, when your opinion as to which variety the description "Vinitor" gives of the quality of Gros Colman really applies will be accepted as being correct. The Vine from which the bunch of Gros Maroc was taken is worked on a Black Hamburgh, and the fruit is of much better flavour than when it is grown on its own roots. Trusting to my own long experience of Gros Colman, I have not Trusting referred to Mr. Barron's book on the Vino for his account of the two varieties in question. I may, however, be permitted to add that the finest house of Gres Colman I have ever seen was at Chiswick, and it was, I believe, the same year that the Apple Congress was held there. Apart from the exhibition of Apples, nothing in the gardens at that time attracted so much attention among gardeners as the house of Grapes. If Mr. Barron failed to get sufficient sweetness into the fruit to give him a good opinion as to its quality. I should say that the house in which they were growing was at fault. It was to the best of my recollection a long narrow house with short flat roof, and high upright front. The vinery in which Gros Colman is grown in the gardens at Maiden Erlegh, is just the reverse of the Chiswick house, having a very sharp-pitched roof, and is a very light T. Turton, Maiden Erlegh. [Gros Maroc was the better Grape in flavour. Et.1

EXHIBITING GRAPES AT THE CRYSTAL PALACE. -In arranging the competitive tables for Grapes at the Crystal Palace, they should be so put as to have the exhibits to face one way only. The four-sided the exhibits to face one way only. tables at present in use are of great advantage to some exhibitors, and as great a disadvantage to others. If my recollection of the tables be correct, the square ones held twelve hunches of Grapes on each side, and the sides faced the points of the compass. The exhibitor who stages his fruit on the northwest side, has an advantage over those staged on the south-east side, because the roof of the Palace being of glass (if the day happen to be fine), the rays of the sun will shine on the Grapes that are staged on the south and east sides, whereas those on the other side will not have as good a light, and all the less if tall pot-plants stand in the middle of these tables, as was the case in 1894. Nevertheless, Grapes of good colour can be indged in bright sunlight, and will lose nothing by it; whereas badly-coloured Grapes will lose by judging them in the same light. All good judges prefer to expose them to as much light as possible before giving a decision. The judges who act at the Crystal Palace shows with tables arranged as above shown, labour under a great disadvantage, especially when there is little difference between twelve, six, or three bunches of Grapes, when the fruit is placed on opposite sides of the table, one lot being in the shadow, and the other in the light; and it will sometimes happen that the exhibits in the samo class are staged on a different table. It is probably not needful to point out any more errors, to have them remedied. The Royal Horticultural Society will surely make arrangements in time to accommodate exhibitors another year. The better way would be for the tables to be placed in the nave of the Palace with one face only, as by such an arrangement the judges would be better enabled to carry out their duties. I endorse "A. D.'s " remark on trimming the bunches of Grapes, and I use the scissors very freely in trimming the bunches and shaping most varieties of Grapes, especially if the bunches are large with heavy shoulders. loose bauch with large berries and finely finished is not a perfect bunch of Grapes; whereas, a smaller bunch that has been trimmed will be lighter in weight, but firm and compact, and may be large in berry and finely finished, and will be considered a perfect bunch. Nevertheless, a large, heavy bunch of Grapes, if other points are good, is very difficult to beat. It should have symmetry of bunch, size of berry, and finish, to be perfect. A. Kirk, Norwood, Alloa, N.B.

POTATOS.—In the matter of Potatos, whether large Potatos or many, is it worth your while to record, as may truthfully be done, that Mr. Edward Vinall, of this parish, recently found upon a single root seventy-four Potatos, whose combined weight was twelve pounds and a half! Archibald Constable, High Hurstwood Vivarage, Buxted, Oct. 20, 1896.

AMPELOPSIS VEITCHII PURPUREA.—This is one of the very hest elimbing plants for summer as well as autumn effect. As a single specimen, or associated with evergreen plants, it is much admired. Its long growths are useful when cut in decorations of all descriptions. The plant is perfectly hardy, thrives in a good sandy loam, and makes a rapid growth if mulched once a year with a rich compost.

It would be effective if planted at the base of some of the forest trees near to woodland walks or pleasuregrounds, where the shade is not too dense. Here we have Ampelopsis hederacea in such positions, and at this season of the year it is lovely. Herbart May, Markree Castle, Shiyo.

CHRYSANTHEMUM, BEAUTY OF TEIGNMOUTH (Pride of Madford). -Mr. Godfrey's notice in your last issue only partly explains the anomaly of this variety having been Certificated under two names, and Mr. D. C. Powell at page 558 does not throw much light That it was grown in Sydney under the name of Pride of Madford prior to October, 1895, I can positively assert, and the dull red thing I never saw there under that name. The question arises, did the two varieties sent to Teignmonth get interchanged, or was the wrong variety sent over from Victoria to Sydney? Possibly the blooms certificated here as Pride of Madford were grown from Sydney stock. That they are one and the same there is not the shadow of a doubt. I am not a Chrysanthemum fancier probably could not identify six whites if my life depended on it—and was quite unaware beforehand of the confusion which had arisen; yet, on going through a collection of Chrysanthenums lately, I immediately recognised Pride of Madford as grown in Sydney in what is here known as Beauty of Teignmouth; and this I remarked to the grower. He then pointed out to me the dull red variety originally supposed to be the genuine Pride of Madford. Chrysanthemum growers-especially those in Sydney-will be interested to know which name it is best entitled to, and by which it will be known. So much for the comie side of the medley. Now let us regard the matter from a more serious aspect. Buyers will probably in many cases have ordered the variety under both names, and, but for a timely explanation, might assume they had been "got at." I am sending to my Sydney friends in June some presumably good things from among the newer varieties, and might possibly have sent Pride of Madford back to the land of its birth, where should it have survived the voyage of 12,000 or 14,000 miles-it would have consigned to the rubbish-heap with small thanks to me for sending, however good, what was already there in abundance. C. Branett, Warblington, Havant.

NEEP'S WHITE, YELLOW, GOLDEN, BEET-TURNIP, AND CARROT-ROOTED RED GLOBE ONION.—Permit me to thank your genial and obliging correspondents for their contributions on this interesting and by no means unimportant subject. For many years I have been more or less familiar with the vegetables, &c., grown on both sides of the Tweed. As judge, horticultural lecturer, observer, reporter and cultivator, I have noted with interest the rise and fall of not a few varieties, but had never seen such a complete change of colour and form on the two sides of the Tweed as was waverley show of the Royal Caledonian Horti-cultural Society last year. Having judged at the Palace and several other shows, and also seen many gardens shortly before, the change was the more conspicuous and apparent. Naturally I enquired the reason why. With every desire to be thankful for small mercies, in this matter, however, I can hardly pronounce the answers as exhaustive or decisive. For example, I wholly demur to the statements that Turnip-rooted Beet, carefully selected and well cultivated, is inferior in quality or less sightly in salsd than the long rooted. Neither have I yet seen any Beet in Edinburgh equal to the finer samples grown and shown in the South. The Golden Globe and other yellow Turnips shown in Edinburgh were models of form and quality. But what not a few call superior flavour to white, is simply, too much Neep, such as others, and the majority of French chefs, designate harsh and strong. It may be admitted that culture is the dominant factor in the flavour alike of Neeps and Beets, rather than form and colour, yet the correlation of flavour to colour is worth noting, and is at times probably far more potent than we imagine. But in not a few things the wide open eye leads us rather than our blind palates. Hence, perhaps, Golden Neeps have been preferred at times to Red Dutch, and Green-topped Stones. Neeps as white as the driven snow, and sweeter than a mild fresh Walnut. And then again crimson, or crimson colours rule the roast among Beets, though some may prefer greener, paler, or even the whiter strains of Sugar-Beet, this last being less earthy than most other Beets. The Red Globe Onion is also held by some to keep longer, and

rest or sleep more soundly than most other coloured Onions, golden or white. Is any one prepared with facts or proof that the warm colour helps the Red Globe, er other high-coloured Onions, to keep better. Again, is there any better reason than use and wont why we should insist on having our Onions white and our Beets crimson. Here, too, in Great Britain our Cucumbers must be green. Cross the Channel to Paris, and you will find many, perhaps most of them white and nasty. But the correlation of colour from size to flavour and quality were hardly raised in my first letter, which naturally noted the fact that, in the great vegetable show of the Royal Caledonian Horticultural Society in the Waverley Market, Edinburgh, few or no white Neeps, nor Turnip-rooted Beets, were to be seen or found. Vour readers will, I am sure, agree with me that the questions put and answers given, have had considerable interest to producers and consumers alike. considerable interest to produce s and consumers and consu with her knife, or a clever cutter's represenwith her kmie, or a clever cutter's representations of Carrot, Neep, or other vegetable flowers for garnishing her dishes' If the cook will ask the dairyman who makes her butter-pats blossem as a Marchal Niel Rose, he will show her how to make round discs of Beet look things of taste and hearth hearth in the scale of the cook will be the calculation. and beauty in her salad. One more point gave me special pleasure, that is, that the seedman's letter in the thardeners' Chronicle of last week, in which he stated that the English firm with which he was connected sold nearly ten thousand packets of Beet last year. I care but little that 9000 of these were long forms, and 650 Turnip-rooted; but 1 rejoice that in Buteshire, and on both sides of the Tweed, consumers have learned to eat Beet, though I have seen but scapt proof as yet, either in the shops or markets of Edinburgh, that Beet - eating is anything like so popular in the north as it is in the south. But if "Scot's" numbers may be accepted as an average, Bect may soon be as popular as Tomatos. D. T. F.

CYCLAMENS FAILING TO OPEN THEIR FLOWERS.

—One can feel for "C. B. W." in respect to the failure of his Cyclamens. Twenty years since I had some Cyclamen plants which failed similarly, and, like him, I applied for advice to one of the horticultural journals, and received answers and advice in great abundance, but much of it conflicting so much so, that putting the whole of the evidence I thus obtained together, I began to unravel the subject for myself. In my case the plants had been grown in myself. In my case the plants had been grown in 5-inch pots, and the corms were crowded with flower-buds, scarcely one of which expanded properly. They did not, as appears to be the case with "C. B. W.'s" plants, "remain buds," but those that got beyond that stage produced deformed blooms. Externally, my plants were avidence of good suffices. That my plants gave evidence of good culture, that is, they were clothed with handsome foliage, and about 10 to 12 inches across. Nor was this all, for on some of the largest 1 counted 120 buds, and a few of them had considerably more, which made matters more provoking, since both my employer and myself were looking forward to a fine display. "C. B. W." does not give the size of pot his plants are growing in, which would be useful information. Nor is anything said about the kind of soil used, and so forth. The temperature given is rather in excess of what is usually employed, a maximum of 50° by artificial heat being sufficiently high. The excess of heat, however, would scarcely cause the mischief, though it might produce weakly stems and leaves I have but little doubt that the mischief is the result of a check which might be due to insufficient food supplies at the time when the flower-buds were forming, or at some subsequent period, when the buds were quite small. This view is materially strengthened by the fact that the buds "remain buds, and do not expand." Indeed, this is perhaps the most critical period for the Cyclamen, and a check or series of such at such a time cannot be rejudded afterwards. It is at such time that the plants, provided these be in small pots, require constant care and watchtulness, and a wise step where such beautiful things are grown is to have a weak solution of liquid cow-manure and soot-water in to the plants. If the plants referred to by "('. B. W." are one-year-old seedlings, there has doubtless been a check as stated; but if the corms are older, other causes may have assisted to the same end. My own plants were two and three years old, and I came to the conclusion that an impoverished condition of the soil, and a slight check combined, had centributed to their failure to bloom. The batches of plants raised subsequent to this mishap I watched very closely, and as soon as there were signs of buds forming, I took measures accordingly; and I never had another failure. I naturally concluded that I had solved the mystery in my own case, and I think there is little doubt that semething near akin has happened to "C. B. W.'s" plants. I take it your correspondent has ascertained whether or not he has perfectly formed buds on his plants, as this would be the surest way of arriving at a right conclusion in the matter; good buds would quickly respond to the application of a weak stimulant of soot and cow-dung, and nitrate of soda at the rate of one onnee to three gallons of water. But unless the buds are right, no treatment at the present time will avail, and this year's blooms will be lost. J.

CERTIFICATED DAHLIAS IN OCTOBER. - The fact that Awards of Merit were made to several varieties of Dahlias as late as October 13, almost marks a record. At the corresponding meeting of the Royal Horticultural Society in 1895, Dahlias were largely shown, but scarcely an Award of Merit was made to a new variety. The fact that Dahlias were so finely shown—for the Caetus, single flowered, and Pompon Dahlias were as good as we saw them early in September emphasises the need for a meeting of the Floral Committee of the Royal Herticultural Society during the third week in September, and I hope the Council will see its way clear to arrange for one another year. It ought to be so, because so many good things are inflower between the first week in September and October 13, which cannot be expected to last in good condition until the latter If a fruit show is to be held by the Royal Horticultural Society at the Crystal Palace early in October in 1897, there should be no difficulty in arranging for a meeting of the Floral Committee there. Still, one should certainly be held in the Drill Hall. soon after the middle of September. The growers of Dahlias in particular contribute so much to make the meetings of the Royal Horticultural Society from the end of August to the middle of October gay and attractive with Dahlias, that they deserve some consideration at the hands of the conneil. Besides, the Fruit Committee might reasonably support such a timely suggestion, as a goodly number of varieties of fruit are at their best during the interval of inaction. New fruits and vegetables cannot, it appears, under present arrangements, be dealt with at the Crystal Palace, therefore opportunity should he afforded for doing se in the Drill Hall. And lest it should be put forward as a plea for inaction, that difficulty would be experienced in getting a good quorum of each committee together at that season of the year, 1 do not, from observation, fear any such result : there will always be sufficient numbers present to do justice to any novelties which may be forthcoming. d Correspondent.

OLEARIA HAASTH.—This beautiful Evergreen, figured in last week's Gardeners' Chronicle, is a grand acquisition for town-planting, making splendid growth, and flowering profusely in situations where nothing but Euonymus radicans will thrive satisfactorily. It is entirely unaffected by the dense fogs which prevail in and around bondon during the winter months; while Ancubas, Hollies, Arbutus, &c., suffer to the extent of losing two-thirds of their foliage. W. H. A.

yellow Turnip is much better-flavoured than a good yellow Turnip is much better-flavoured than a good white one," says Mr. Mayne, of Bicton. That his opinion is correct there can be absolutely no doubt. But the same thing is found in so many directions, that it is natural the question be asked, What is the connection that undoubtedly exists between yellow coloration and flavour in vegetable products? As with Turnips, so with Potatos. The yellow-fleshed varieties invariably give better flavour than do those of entirely white-flesh. If there are heavier croppers amongst the white-fleshed ones, none have taste superior to that of the Asbleaf Kidney, and the same thing will be found throughout all the varieties. Even in Tomatos we have none better than the yellow Golden Nugget, although the quality is not highly marked in any of these fruits. Still, in many of the red ones an absence of flavour is remarked. Again in Apples, we find the highest flavour in Ribston and Cox's Orange Pippins, and both these have slight tieges of yellow in the flesh. Flavour is a distinct and far from a common ingredient in fruit or roots of all kinds; how many varieties have we that bave no taste whatever? Of both Apples and Pears these which have flavour in a highly marked degree, may almost be

counted on the fingers. We see the most reliable of all Grapes for high quality, Muscat of Alexandria, to give the highest flavour, and it is yellow in colour; whilst no fruit grown gives such remarkably high flavour as does the Pine-apple, and that toe is yellow. Possibly these facts may not be esteemed sufficient data on which to build up the theory that in vegetable products yellow colour and flavour go together. If we do not grow yellow Turnips much in the south, it is due chiefly to ignorance of their superior quality, and also to prejudices against yellow and in favour of white-fleshed Turnips. A. D.

PERENNIAL ASTERS AS POT PLANTS .-- I have grown some very fine specimens of the Michaelmas Daisies in pots this season, and have tried from twenty to thirty varieties. They will prove very useful as pot-plants for the decoration of conservatories. The method I adopted was the following:— The clumps have a tendency to run very fast in the herbaceous borders, and when these require to be trimmed back, I save the crowns, and place nine or ten of them in an 8-inch pot in good loamy soil. This is done about the middle of February, and water is given sparingly until growth has commenced. When the sheets are about 3 inches high, they are thinned out to about five or seven, according to the variety. I began to feed when the plants were about 12 inches high. I regard the taking of cuttings as unnecessary. They were taken indoors just before the flowers commenced to unfold, and they continue from August until the second week in October. beginning with Aster acris, and finishing with A. Andromeda. The varieties I should recommend for small conservatory decoration would be A. acris; pharmacoides, vesta, kevigatus, nanus, spectabilis, cordifolius, elegans, viminens, horizontalis (very elegant), A. W. Grant, and Amellus bessarabicus. For larger houses, Novi-Belgi vars, Lady Trevelyan, llarpur Crewe, Juno, Mons. d'Angon, Kavenane, puniceus, and Novæ-Angliæ roseus. These are very free-flowering sorts. Those in the first selection do not grow more than 4 feet in height, but can be head? 2 feet threads. If thinged to three or four had 3 feet through. If thinned to three or four shoots they would not be more than 2 feet through. I intend stopping the shoets upon some of the plants next season, for I have noticed that where a branch has been broken off by accident it has had a tendency to make the plant produce more shoots, and remain dwarfer. M. E. Mills, The Gardens, Coombe House, Croydon.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

OCTOBER 27.—P.E.ENI Dr. M. T. Masters (in the Chair), Mr. Douglas, Rev. W. Wilks, Dr. Bonavia, Mr. Ch. E. Shea, Rev. G. Henslow (Hon. Sec.).

New Carnation Disease. Mr. Douglas exhibited specimens of Carnation plants badly attacked by a species of bacterium (Bacterium dlanthi), giving a silvery appearance to the leaves. It had previously proved to be very destructive in America, and it is probable that at will now be so here. If the leaves are cut away when first attacked the disease may be arrested; spraying with a weak solution of ammoniacal copper car bonate may be tried, but the only remedy if it be more severe is to burn the plants. The fungus attacks the middle of the leaf, and then spreads both ways.

Chrysanthemum Maljormed. Mr. Jenkins, of Hampton, sent a specimen of Midame Desgranges, in which the white ray florets were almost entirely suppressed. The flowers sent were borne by one plant only, which was growing in the same pot with another of the same name; but while all the flowers on the one plant were malformed, all on the other were very good. No disease being apparent, it appeared that the latter plant had withdrawn the nourishment from the soil at the expense of the former, which was consequently starved.

Primula becomes cross.—Dr. Masters exhibited a truss and leaf of a plant raised by crossing P. obcomba with P sinensis (wild form). The offspring, beyond a slight decrease in hairiness, &c., could not be distinguished from the female parent.

Photograph of Palm.—He also showed a photo of a Palm new to cultivation, received from the late Baron von Mueller, who wrote as follows:—"In 1882 I described the Beatrice Palm, then discovered by Mr. Eugène Fitzalan on Mount Elliott in N.E. Queensland (Ptychosperma Beatrice). It is allied to P. Alexandrae, but is remarkable for the wide cultrgement towards the base of the stem with step-like processes. It differs also in the much less hardness of the stem, and in the leaves being almost straight to the summit, hesides in having smaller fruits and other minor characteristics." This communication, received about a fortnight after the Baron's decease, is the last of his many contributions.

Melon Fruit, Photo. - Dr. Masters also showed a photograph of a Melon growing from the unusual position of the "collar," or junction between root and stem on the ground.

Nitragine.—It was suggested that this material, consisting of the bacteria peculiar to each particular leguminous crop, and used by allowing the seed to soak in it, or by fertilising the soil with it, should be tried at Chiswick.

Hypertrophy of Troppolem. -Dr. Masters also showed a dense globular mass of abortive shoots, which had grown at the base of the stem, probably in consequence of some injury to the collar. Such abnormal outgrowths are not uncommon in Pelargonia, which are allied to Tropscolum,

November 10. - An ordinary meeting of the Committees was held in the Drill Hall, James Street, Westminster, on Tuesday last. Considering the date of the season there was an average number of exhibits, but it is probable that there would have been more Orchids present but for the sharp frosts that have occurred. As might have been anticipated, the major portion of the display was furnished by Chrysanthemums, of which there were many collections shown, both as plants and as cut blooms. Fruit was little shown if we except the fine collection of Grapes noticed below. There was a large exhibit of vegetables from Messrs. Dorbie,

large bloom of rosy purple, with purple and yellow cushion,

a meritorious variety exhibited by Mr. Gardiner.

From C. E. Shea, Esq., Foots Cray, Kent, were exhibited three dozen Japanese incurved and Japanese reflexed blooms. Many of the novelties were represented in excellent condition, together with a few of the older ones (Shear Edge). (Silver Flora Medal).

Mr. W. J. Godfrey, Exmouth Nurseries, Devon, exhibited forty-eight blooms of Chrysanthemum novelties, also a few blooms of varieties of Carnations and hunches of decorative Chrysanthemums. Most of the varieties of Chrysanthemums were novelties that have been exhibited previously; others we have not before noticed. Wilfred H. Godfrey, Japanese we have not before noticed. Wilfred H. Godfrey, Japanese incurved, very dark chestnut and yellow; Indiana, a very broad flower of lilac-pink, florets slightly incurving; and Mr. J. P. Bryce, crimson Japanese with buff reverse, were promising varieties (Silver Flora Medal).

Miss A. S. Ridef, Staines (gr., Mr. Geo, Lane), showed as incurved Chrysanthemums Miss A. S. Ridge and Triumph.

as incurved Chrysanthemums Miss A. S. Ridge and Triumph d'Ere, but no award was made.

Mr. Robert Owen, Castle Hill Nurseries, Maidenhead, exhibited a nice lot of blooms in bottles. The habit of the varieties was illustrated by the long steins attached to the flowers. An Award of Merit was recommended to Duke of Wellington, a Japanese incurved of old gold or buff colour, very large; and to Mr. R. Owen, a yellow decorative variety, with extremely narrow florets (Award of Merit).

varieties, and the group was faced with a few foliage plants, the whole creating a bright floral effect (Silver Banksian Medal).

Messrs, Young and Dobinson, Stevenage, Herts, exhibited cut blooms of Chrysanthemums, Gloxinias in flower, &c. (Bronze Banksian Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the chair), and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshay, H. M. Pollett, E. Hill, T. W. Bond, J. Gabriel, W. H. White, H. J. Chapman. Chas. Winn, C. Pilcher, S. Courtauld, H. Ballantine, and T.

Messrs, Ja., Veitch & Sons, Royal Exotic Nursery, King's-road, Chelsen, were awarded a Silver Flora Medal for a very remarkable group of Orchids, consisting exclusively of hybrids, numbering thirty-two, and all distinct and showy, forcibly illustrating the work of the firm in ruising hybrid Orchids, especially those which flower in the winter, a class in which the imported species still leave room for the hybridist's skill to a very great extent. The most of these hybrids was Leho Cittleya. Nysa superba. L. crispa. C. Warseewiczii), to which a First class Certificate was awarded. It may be said of this hybrid that it is one of the few which excel in bourty the formula 1.00 so expinensis which Mosers.

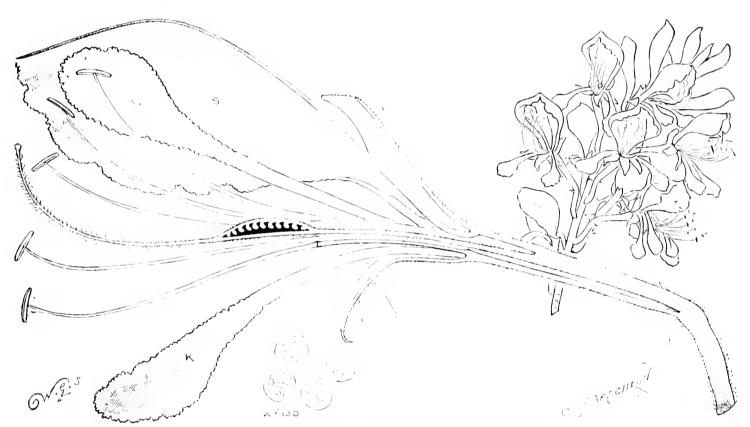

Fig. 106.—Camoensia Maxima: flower shen in section, with details.

S, standard petal; W, side petals, forming the wings; K, lower petals, forming the keel; C, C, sepals Pollen cells magn. 120 dram (See p. 506)

Floral Committee.

Present: W. Marshall, Esq., in the Chair, with Messrs. H. B. May, H. Herbst, R. Owen, G. Stevens, J. F. McLeod, C. Jeffries, J. Walker, J. D. Pawle, G. Paul, C. E. Pearson, C. E. Shea, C. Blick, H. Selfe Leonard, J. Laing, Rev. H. H. D'Ombrain, E. Mawley, J. Fraser, and R. M. Hogg.

Mr. Reynolds, gr. to Messrs. de ROTHSCHILD, Gunnersbury Park, Acton, W., exhibited about a score of plants in bloom of Lycoris aurea. This is a very pretty species, and proof Lycons aurea. This is a very pretty species, and produces four, five, or six blooms upon each scape. For an illustration of the flower see Gardeners' Chronicle, p. 545, vol. xviii, 3rd S. (Silver Flora Medal).

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery,

King's-road, Chelsea, were recommended a Botanical Certi-ficate for Amorphophallus variabilis. The plant shown The plant shown appeared to resemble A. campanulatus, but differed slightly in colour.

Mr. H. J. JONES, Ryccroft Nursery, Hither Green, Lewisham, staged three blooms each of Mrs. C. Orchard, an incurved Japanese of pale lemon, large (Award of Merit; Jas. Cornford, white, incurved Japanese; H. J. Cuthush, yellow Japanese, marked with rose; and Plateau de Teck, white Japanese, florets slightly reflexed.

An award of Merit was recommended to Anemone-flowered Chrysanthemum Mr. Hugh H. Gardiner, a fine

Royal Standard, a very striking crimson Japanese, with reflexed florets, was well worth remark, as were also several other good seedlings.

A pretty Japanese Chrysanthenum bloom named Pelmo was exhibited by C. E. Shea, Esq., Foots Cray, Kent. The colour was yellow passing into red.

Mr. Geo. Wythes, gr. to Earl Percy, Syon House, Brent-ford, made a display with Chry-authemum blooms. These were cut with long stems and staged in earthenware bottles. three in each, the whole very freely interspersed with foliage plants (Silver Flora Medal).

Mr. H. J. Jones, Hither Green. Lewisham, displayed an exceedingly pretty group of Chrysunthemums, interspersed with Crotons, Palms, and other fine foliage plants. The quality of the blooms on the plants was first rate. Ma Perfection was one of the varieties included. It has already been described in these columns as a doubtful incurved bloom, and an Award of Merit was recommended to it upon this occasion, when it was generally voted a Japanese incurved. Madame Carnot, Mrs. C. E. Shea, Mrs. H. Chiesman, Major Bonnaffon, Edith Tabor, and others were very fine, and the general effect was one of exceptional beauty (Silver-gilt Flora Medal).

Another group of Chrysanthemunis was one staged by Mr. Thos. S. Warr, Hale Farm Nurseries, near Tottenham. The plants in this case were of single flowered and decorative

Verteb raised many years 130, and to which L.-C. Nysa superbalhas some resemblance, except that the flowers are broader in all their parts, and the glowing colour of the lip nedines more towards reddish crimson than to purple. Another pretty novelty was Cattleya - Fabiola (Bowringiana - Harrisii -). C. > Harrisii, it will be remembered, is C. labiata Mendeli & - Leopoldi V. Cattleya - Fabiola, in the form of its flowers, partakes of C. Bowringiana, but they are much began the greats and patch of a librative they are much larger, the sepals and petals of a lilac tint, the front of the lip dark purple. There were also the front of the lip dark purple. There were also observed in the group three fine hybrids of Lodia Perrini, viz., Lelio-Cattleya × Lady Rothschild (L. Perrini × C. Warseewiezi, a very showy flower, with a lip of soft purple colouring, and white tube to the folded lip of soft purple colouring, and white tube to the folded ase; the sepuls and petals are of a light rosylliae hue; L.C. & Decia (L. Perrini & C. aurea), in which the prematic arrangement of the colouring of the lip is very beautiful; and L. C. & Statteriana (L. Perrini & C. labiata). Other good hybrids were L. C. & Pallas, severel Cattleya & Mantini, Cypripedium & Niobe, C. & Arthurianam, C. & vexillarium, C. & Lecamm, C. & tesselatum porphyreum, C. Milo, Masdevallia & Apax (* Chelsoni & Peristeria), M. & Asmodia, and several hybrid Selenipediums.

FRED. HARDY, Esq., Tyntesheld, Ashton-on-Mersey (g1., Mr. T. Stafford), showed a very remarkable imported Cyptipedium from the Shan States, about which opinions differ as to whether it is a variation in the nature of an albino of C. Charlesworthii, or a natural hybrid. Certain it is that the like has not appeared before, and the name Cypripedium "Fred. Hardy," will serve well to distinguish it. The foliage somewhat resembled that of C. hirsutissimum, and the flowers had petals and lip of a clear greenish-yellow colour, upper sepal pure white, with a faint purple tinge at the base, and the staminode was white, with a pale yellow boss in the centre (Award of Merit). Mr. Hardy also exhibited a good form of Cattleya - Hardyana.

form of Cartieya - Larrayana. W. Thompson, Esq., Walton Gringe, Stone, Stafford (gr., Mr. Stevens), received a Silver Banksian Medal for a very pretty group of very fine flower-spikes of Odontoglossum crispum, O. Andersonianum, &c., set up with equally fine Cattleya Libiata; Odontoglossum crispum, "Golden Queen," tine light yellow flower with brown spots, secured an

Award of Merit.

Award of Merit.

H. MANN BASS, ESOL, Byrkley, Burton-on-Trent. gr., Mr. J. Hamilton), showed Cattleya maxima alba, a true albino, with pure white flowers, and the first which has appeared of this species (First-class Certificate). G. W. L.W.-Schoffena, Esq., New Hall Hey, Rawtenstall, near Manchester (gr., Mr. Shill), exhibited a grand plant of the pure white Pleione maculata alba, with thirty flowers; also drawings of several (followers behalfs in bis collection). of the rare hybrids in his collection.

Baron Sir H. Schroder, The Dell, Egham (gr., Mr. II.

Baron Sir H. Schroder, The Dell, Egham (gr., Mr. H. Ballantine), showed a noble spike of the original Cymbidium x Traceyanum, which secured a Cultural Commendation; also the white Cattleya labiata Countess Fitzwilliam.

H. S. Leos, Esq. Bletchley Park, Bletchley (gr., Mr. Hislop), showed a superbly grown plant of Leila pumila (Bletchley Park var), with eleven very large and finely-coloured flowers (Cultural Commendation); also Cattleya labiata venosa, a strange form, veined and striped on all the segments with puride, and with a rede rose median line un segments with purple, and with a pde rose median line up the sepals and petals. It is a pretty form, and it would be the sepals and petals. interesting to know whether it is constant; the allied C. I.

micresting to know whether it is constant; the allied C. I. marmorata of Mr. Gabriel having reverted, for a time at least.

Messrs. F. Sander & Co. had a neat group edged with Sophronitis grandiflora, consisting of, among other things, Cypripedium × Alcides, varieties of C. insigne, Cyperorchis elegans, Dendrobium Johnsonia, some good varieties of Cattleya labiata, the pretty Trichopilia brevis, Ladia qualla, Phila Chantles, Amelika, Chantles in the constitution of the constitution Ledia punila, Phaio-Calanthe - Arnoldia, Oncidium tigri-num, and the singular Calanthe × albata (veratrifolia Cooksom -, a curious break between the evergreen and the decidrous C danthes, with white flowers, intermediate in form between the parents. The group was awarded a Silver Banksian Medal. C. L. N. INGRAM, Esq., Elstead House, Godalming (gr.,

Mr. T. W. Bond), showed Ladio-Cattleya × Minerva L. Perrini · C. Lowienecana), a very pretty rose-coloured flower with purple lip; L.-C. × Homère (L. Perrini × C. Percivaliana), of the form of L. Perrini, but with a rounded crimped front to the lip, like a small C. Mossie; and L.-C.

 Meteor (L. Dayana × C. Bowringiana).
 Messrs. Huon Low & Co., Clapton, had a bright group in Messrs. Hoof Low & Co., Carpon, had a origin group in which the Cattleya labiata were specially noticeable, and the variety C. I. grandis had very large and richly-coloured flowers. This group also contained excellent plants of Miltonia Roczli, M. R. alba, Cattleya × Minucia, &c. (Vote

of Thanks).
Mr. R. Guzow, Bexley Heath, staged a pretty group in which were many good form of Dendrobium Phalemopsis; the most admired being D. P. Miss Lawford, a pure white flower, with delicate pink vening on the labellum. Some very fine Cattleya labiata were also in the group (Vote of Thanks). Franches Brander, Riesbach, Zurich, sent a very richly-coloured form of Odontoglossum Krameri and Odontoglossum cristatellum. Col. Wuson, Hillside, and Odontoglossum Crisatelium. Col. Wilsos, Imisale, Allerton, Liverpool (gr., Mr. Healey), sent Cypripedium (bellatulum × callosum). J. Hawtnors Kir-ox, Esq., Elmet Hall, Leeds (gr., Mr. T. Bonsall), sent a splendid form of Odontoglossum Uro-Skinneri and Cattleya Bowringiana, of Ogantogiossim Cros-skinleri and Cattleya Bowingana, Elmet Hall varieties. H. Shaw, Esq., Birch Vale, Derby-shire (gr., Mr. Cliffe), showed Cypripedium × Hobsoni. H. H. Borron, Esq., Height Side, Newchurch, Manchester (gr., Mr. Eustwood), sent Cattleya labiata Janea, a very large Mr. Erskwood, Sem Chitheya kibada Sanea, a very large variety. Messes, Gabraway & Co., The Nurseries, Clifton, showed a strange double form of Cattleya labiata.

Fruit Committee.

Present : Philip Crowley, Esq. (in the Chair), and Messrs. Geo. Bunyard, G. W. Cumnins, A. H. Peurson, Alex. De on, Jas. H. Veitch, Jno. A. Laing, F. Q. Lame, James Smith, T. F. Rivers, J. Willard, H. W. Ward, and W. Balderson.

An excellent collection of twenty-four bunches of Grapes An excellent collection of twenty-four bunches of Grapes was shown by C. Bayen, Esq., Tewkesbury Lodge, Forest Hill (gr., Mr. Taylor). This exhibit included three bunches of Mrs. Pince, one of which was remarkable for good colour, two bunches of Mrs. Pearson of much merit, two bunches of Gros Marce, an equal number of Gros Coloum, two good bunches of Muscat of Alexandria, two of Gros Guillaume, two large of Muscat of Arexandra, two in trips ordiname, two large bunches of Trebbiano, one small bunch of black Hamburgh, two excellent bunches of Black Alicante (fairly large, and possessing remarkable colour), two bunches of Foster's Seed-

possessing remarkable colour), two bunches of Poster's Seedling, two of Lady Downes, and two of Aluwick Seedling. Those of Foster's Seedling were the weakest of the varieties shown (Silver Knightean Medal).

Messes Domar & Co., Rothesay, N.B., and Orpington, Kent, filled one of the large tables with exhibits of superior vegetables. There were very fine Onions of large size, large heads of Celery, some exceptionally good International Prize, and Champion Leeks, Parsnips, Beet, and some very even roots of yellow-fleshed Turnips were included, together with Parsley of a good type (Silver Banksian Medal).

Competitive Fruit Classes .- In Pears the 1st prize for flavour was taken by Benrré d'Anjou, shown by Mr. C. Herrin, gr., Dropmore, the fruit being clean, of fair size, and free from blemish; the 2nd prize fell to Knight's Monarch, shown by Mr. Robert Mauer, gr., Tattenden Court; the fruit came from a pyramid growing on the wilding stock. Other varieties were shown, but they failed to obtain a place: these were Beurré Diel, Brown Beurré, both from pyramidal trees; Soldat Laboreur, Marie Louise, and Glout Moreeau, from trees on the Onince.

The Apple Competition .- Here the 1st prize was taken by Cox's Orange Pippin, exhibited by J. T. Charlesworth, Esq., Nutfield Court, Surrey (gr., Mr. J. W. Herbert), and was the produce of a pyramidal tree worked on the Paradise was the produce of a pyramman tree worker on the transacts stock, growing on a light loamy soil, overlying marl, containing much iron-stone. The fruit was large, and above the average in size. The 2nd prize fell to Ribston Pippin, shown by ROGER LEIGH, Es₁, Barham Court, Maidstone (gr., Mr. G. Woodward); the fruit was of high colour, and came from an espailer tree growing in the open quarter, and worked on the Unifor tree the cit, a readwards, because worked on the Paradise-stock, the soil a moderately heavy loam. Several dishes of Cornish Gilliflower, Fearn's Pippin, and King of the Pippins came from various exhibitors.

Warious seedling Apples were shown by Messrs. W. & J. Brown, Stamford, but they failed to meet with approval, although of nice appearance. W. H. Barber, Esq., Wem, Salop, showed Apple Queen Caroline.

Lectures on Seed Raising.

The First Lecture was delivered by Mr. R. Fyfe, who at the commencement remarked upon the importance of the question, and said that crops raised immediately from seed formed by far the greater portion of the food of nations. The remaining part was also furnished indirectly by seeds. Though the process of seed saving had been practised in all countries and in all times, it was only when connected with a high state of civilisation that the work became a fine art. The selection of seeds of vegetables and flowers was now practised so commonly that each seed firm usually possessed its own strain of particular plants. The efforts of seedsmen were directed to maintaining or surpassing the improvements that had already been obtained in the plaints with which they had to deal. This was done by two methods, viz., selection and cross-fertilisation. The latter process was necessary when it was wished to mite in one plant the qualities possessed by two But to fix a type, and to gradually improve one, careful selection from year to year was necessary. The lecturer then said that the quality of selected seeds would depend largely upon that the quanty of selected seeds would depend Pirgely upon the seedsman's idea of what "selected" seeds should be, Personally, Mr. Fyfe thought that selected seeds should be the immediate produce of roots or plants selected for the production of the same, and the process would require to be repeated each generation.

Next was given a description of the lecturer's own prac-Next was given a description of the fecturer's own practice in such matters. A few remarks were made upon the force of heredity in plants, which needed much care to be exercised to prevent any reversion to previous forms occurring. To illustrate the difficulties that occurred sometimes, and in certain plants, when an endeavour was made to fix a type, Mr. Fyfe referred to and gave particulars of experiments he had made with Calendula. The seed sown from an orange-coloured Calendula continually produced seedling plants that bore flowers of all shades of colour from pale lemon to deep orange, and he had found that if a plant with orange-coloured flowers was moved when inflower the blooms became pale lemon, and again reverted to orange later. The colours of flowers, and even more stable charac-teristics in some plants, were very variable. The French Marigolds and single Dahlias were other instances given

Afterwards some very interesting statements were made regarding natural crosses that had taken place between varieties of Turnips that had been plauted near to cachother. varieties of Turnips that had been planted near to cannother. White-fleshed Red Globe and Golden Ball, Red Globe and Model White, had crossed naturally with each other as they flowered in the open. The results of the seeds saved from the plants were of much interest, and were perfectly evident from the Turnips Mr. Fyfe exhibited.

Cranston's Excelsior Onion and Dobbie's Selected Red had crossed in a similar manner. Attention was drawn to the crossed in a similar manner. Attention was drawn to the well-known fact that the more highly a plant was cultivated the less seed does it yield. In conclusion, Mr. Fyfe referred to a belief that existed to the effect that seed saved from certain portions of a plant was better or truer in character than from other portions. It had been proved such was not the case.

A Second Lecture upon the same subject, so far as it related to Agricultural crops, was delivered by Mr. Lone. The choice of soils, and the draining, manuring, and cleansing of the land were referred to. The careful selection of all of the land were referred to. The careful selection of all roots and plants saved for seed-producing, the need of precision on the part of the seedsman in regard to characteristic details in plants, the necessity of moving selected plants and planting them at proper distances in isolated positions, the tendency to cross fertilisation if means were not taken to prevent the same, were subjects upon which the lecturer had something to say. Incidentally, reference was made to the havoe that has latterly been worked amongst the Mustard crop by the mustard-beetle.

The Rev. W. Wilks (Chairman), in thanking the lecturers, referred to the points raised in Mr. Fyfe's paper re the colours in flowers, and said that experiments were now being made to ascertain the cause and what influences the colours in flowers and fruits. It would probably be a long business, and not much positive information could be expected for

some time, but in any case they would soon prove that certain conditions and circumstances did not affect the colour in flowers or fruits.

NATIONAL CHRYSANTHEMUM. CONFERENCE.

Naveween 5 - A Conference was held on the evening of Thursday in the Library of the Royal Aquarium, when papers on the Chrysanthemum were read by gentlemen well known in the Chrysauthemum world. Mr. T. W. SANDERS presided.

THE TYPES OF THE CHRYSANTHEMUM AND THEIR CHARACTER-ISTICS, WITH SUGGESTIONS AS TO THE ADOPTION OF A FULLER CLASSIFICATION.

Mr. George Gordon, editor of the Gardeners' Magazine, read a paper on this subject. He said he felt some diffidence in dealing with the subject of classification, because it did not admit of picturesque treatment, and because they were all to some extent familiar with it. He had, however, obeyed the wish of the committee in preparing a paper on the subject. In discussing the questions of classification of the types of the Chrysauthemum, or, indeed, of any other flower, there were two points which should be kept in view. One was so to arrange the groups, sections, or classes, that the multitudinous forms could with the aid of technical descripmultitudinous forms could with the aid of technical descrip-tions, be allotted a place in their proper section without any great difficulty. The other was to adopt as the basis of the classification the grouping and designations that had come to be generally adopted by the cultivators of the flower. Such a classification would necessarily lack novelty, but it such a classification would prove useful, and in a question of this kind, utility should be the first consideration. The necessity for placing the varieties of the Chrysanthemum in proper order had long been recognised, and several attempts had been made. Having passed in review these attempts which had been made by Mr. A. II. Haworth 63 years ago, and Mr. Salter in 1865, he said it was somewhat singular that the latter, so recently as 30 years ago, should not have attempted in his extension of Haworth's classification to include the large Anomone and the reflexed varieties, which were then plentiful and of greater relative unportance than they were at the present day. Seventeen years ago the writer prepared a wholly new classification which found considerable favour, from the fact that it had, with the exception of one class, been generally adopted by Chrysanthemum societies in the United Kingdom. In this classification there were 7 sections. (1) Incurved, (2) Reflexed, (3) Large Anemone-flowered, (4) Japanese, (5) Pompon, (6) Anemone-flowered, and (7) Intermediate. Since the publication of his first classification in 1879, the Chrysanthemum had undergone a remarkable development, and several new types had been added, with the result that it was no longer sufficient. He, therefore, suggested that the classification of the types of the Chrys-anthemum should be increased. "My suggestions are," continued the writer, "that the classification should comprise twelve sections, and that these should be arranged as

1 Incurved.—The incurved varieties represent in the matter of form the highest degree of perfection to which the Chrysanthemum has been brought, and the perfect bloom does not require the trained eye for the full appreciation of its beauties. The incurved bloom should be as nearly globular as possible: the florets broad or of medium breadth, with perfectly smooth margins and entire apex, rounded or passing to a point, and to be finely incurved, and so closely and regularly arranged as to form a solid ball; the colour to be clear and decisive. In determining the relative merits of incurved Chrysanthemums when placed upon the exhibition stage, flatness of the blooms, irregularity of the florets, hollow centres, weakness of colour, and want of freshness, are serious defects which should be given full consideration by the judges in making their awards.

2. Japanese.—In this class we group all the large-flowered varieties with blooms remarkable for their irregular and fantastic form, and as these evince so great a diversity of character it is practically impossible to give a definition that would apply with any degree of exactitude to any considerable proportion of them, nor is it desirable to mould them according to any set of rules, as one of their most valuable attributes is the great variety in form as well as colour afforded by the blooms of the varieties belonging to the section. The blooms of the Japaness Chrysanthemums should be of medium or large size, and more or less irregular in form; the florets may be broad or thread-like, or of any breadth between these extremes. They may be entire or divided one or more times, drooping, horizontal, creet, or incurving; but there should not be any great difference in the size or form of the florets of any one bloom; the colour should be pure in the case of the white varieties, clear in the light shades, and rich and effective in the high-coloured forms. Size of bloom according to the respective varieties; fulness, uniformity in the size and shape of the florets, and runness, unnormity in the size and shape of the horets, and purity or brightness of colour are merits; and extreme regularity in the arrangement of the florets, coarseness, confused or thin blooms, and ineffective colouring are defects.

3. Japanese Incurred.—The varieties forming this section are distinguished from the typical Japanese by the incurring of the large terms. The blooms of the Japanese incurred about.

of the florets. The blooms of the Japanese incurved should be of large size, globular in outline, and have florets, narrow or of great breadth, and irregularly Incurving. In the varieties of this section, depth as well as diameter of bloom is of importance, although less so than in the case of the incurved; but like the blooms of these the whole of the florets should incurve, the incurving of a few of those in the centre not being sufficient to entitle the variety to a place in the section. Large size without coarseness, effectiveness of colouring, and well incurved dorets are merits; and the reflexing of the florets, whether from age or any other cause, thinness and want of brightness, are defects. For the present the varieties properly belonging to this section are admissible in all classes for Japanese, unless special classes are provided for them, in which case, provided it is desired to exclude them from the other classes, there should be a stipulation to that effect in the schedule.

4. Large Refleced.—The varieties belonging to this class should have flowers that are more or less circular in outline, and with regularly-arranged florets. The blooms of the reflexed should be from medium to large, perfectly circular at the circumference, and with high centre: the florets may be narrow or broad, but should have a regular margin and an entire apex, and regularly reflex, the colour to be clear and decisive. Evenness of outline, regularity in the arrangement of the florets, are merits; and irregularity, whether in the outline or the florets, or hollow centre and dulness of colour, are defects

5. Large Anomone Flowered.—These comprise a very distinct and extremely beautiful class, and they should on all occasions be kept quite distinct from their more showy but less refined rivals, the Japanese Anemonos. The Anemone Chrysanthemums, without respect to class, consist of two distinct sets of florets—one strap-like, drouping or spreading out horizontally, and known as the ray florets, and forming the border; and the other quilled, and forming the cushion or disc. In the case of the large Anemone-flowered, the ray florets should be broad, and so regularly arranged as to form an even and perfectly circular outline, and clear or rich in outline; and quilled florets so arranged as to form a hemispherical cushion-like centre. Regularity of the ray florets, high centre, and bright colouring are merits; and unevenness in the outline, hollowness in the centre, and meffective colouring are defects.

6. Japanese Anamones—These, as in the ordurary type of Japanese, have blooms distinguished by their large-size, fantastic form, and effective colouring. In the Japanese Anemone Chrysanthemum the centre should be full, but not necessarily hemispherical, as in the large Anemone flowered; and the ray florets of varying breadth, short or of considerable length, drooping or horizontal, carled or straight, but more or less irregularly arranged. The irregularity of the ray florets is one of the most distinctive characteristics of the section; and it should be distinctly understood that roughness in a large Anemone flowered does not justify it having a place in this section, of which elegance is one of its most distinctive characteristics.

7. Hairy or Hersute.—The varieties with blooms furnished with glandular hairs on the back of the florets, belong almost exclusively to the Japanese sections, but it does not necessarily follow that this class should be limited to them. On the contrary, all varieties, of which the flowers are constantly hirsute, are admissible. The blooms, therefore, may be incurved, or reflexed, or funtastic in form, have Anchone centres or not; but they must be constantly, in a greater or lesser degree, furnished with glandular hairs on the back or reverse of the florets, and the profusion of these should be regarded as one of the chief points of merit.

8. Pompons.—The small-flowered or Pompon Chrysunthenums are so valuable for various purposes that any tendency to excessive size, relatively speaking, or coarsenss, should be effectually checked. The Pompon Chrysanthenum may have blooms rather flat or globular, and the florets may be that, duted, or quilled, spreading out horizontally, creet, or incurving; but the blooms should be neat, and not exceed two inches in diameter.

9. Fringed Panapans. -In, this section the distinguishing characteristic is the division in the florets, which, instead of being entire as in the typical Pompon, may be fimbriated at the margin or deeply cut. In all other particulars the varieties belonging to the section agree with the typical forms, and they may be shown with them unless there are stipulations in the schedule to the contrary.

10. Pompon Anemones.—These, as in the case of the Pompons, have a dwarf habit, small foliage, and neat blooms; but they differ from them in the blooms consisting of two distinct types of florets. The Pompon Anemone is a miniature counterpart of the large Anemone-flowered. The ray florets should be flat and regularly arranged, forming a complete circle, the dise full and hemispherical, and the colour clear and decisive. Irregularity in the ray florets and a low cushion are serious defects.

11. Lary flowered Singles.—The single varieties are rapidly acquiring importance, and the diversity in the size of the blooms has rendered it necessary to form them into two groups, the first group to comprise those varieties which have blooms exceeding three inches in diameter and large foliage. The blooms of the large-flowered singles should be not less than three inches in diameter under ordinary culture, and contain not more than two rows of ray florets; the latter may be long or short, drooping, horizontal, or incurving, and regular or irregular in arrangement, while the disc florets must not be sufficiently raised as to form a cushion in the centre.

12. Pompon Singles.—Varieties to be admissible in this class should have the short study habit and the small foliage characteristic of the Pompons and the Pompon Anomones. The blooms of the Pompon singles should not exceed three inches in diameter when grown under high culture; they should not have more than two rows of ray florets, and these should be regularly arranged and perfectly flat; the disc must not be raised or unduly promi-

nent. In determining whether a single variety belongs to this or the section immediately preceding it, the size and character of the foliage should be taken into account.

Continuing, the writer says :- With reference to the definitions, I would take advantage of this opportunity for suggesting the desirability of members of committees, of judges, and, indeed, of all who have to deal with new varieties, making themselves familiar with the points defining the several classes, for it is only by a fulness of knowledge that we can hope to avoid mistakes. This appears to be especially necessary in the case of the incurved, for a danger has been foreshadowed of varieties being added to the class that properly belong to the Japanese incurved. No one could possibly be more ready to welcome additions to the class than myself, but I do not want it to be the re-ceptucle for Japanese incurveds that are neither bold enough sufficiently beautiful to justify their being distributed as such. So long as the incurved are retained and 1 see no signs of their being pushed out by their more showy rivalslet us insist upon regularly-arranged and overlapping florets that, when properly developed, will form a bloom globular in form and full in the centre. On the other hand, the florets of the Japanese incurved must not be so regularly arranged as to form a globe. With regard to the typical Japanese, it is not necessary that I should say much, because I have now nothing to do with the morits of blooms when in competition; but I would, in passing, express my entire concurrence with the action of the Catalogue Committee in abolishing the class for Japunese reflexed. I have never liked the class, and experience in judging has convinced me that it was an unnecessary and undesirable one. The reflexed section does not require any special comment, except to say that it would be a great gain to improve the class by adding to it a considerable number of varieties, that we may have

finer flowers and a greater diversity of colour in the section.

Mr. Witte asked whether the writer could say what
caused the "hairs" to grov upon hirsute flowers?

Mr. Goldon said he had not gone into the matter with

Mr. Goldon said he had not gone into the matter with sufficient depth to be able to give the botanical description of the cause. He thought that a peculiar constitution of the variety caused the hairs, but at present we were not sufficiently informed as to the causes.

Mr Wirry said he had been inquiring into the point for some time past, and he had been examining the flowers under the microscope. At first he thought that what he saw was a decomposition of the tissue, but on further examination he found that every one of the glands was charged with water, and that each gland had a localified dewdrop upon it of course. Nature had made that provision for some purpose, and he thought someone might be able to help him in solving the problem.

The CHAIRMAN suggested that the petals were collecting more moisture than they could carry, and that the moisture was forced out and formed the dewdrop.

Mr. Wirry said that was just the opposite of the view he took, which was that the drop of water was really food for the flower.

Mr. Sur a said the matter was not understood at present, but he rather agreed with the Chairman that the drop was a provision of Nature for getting rid of certain moisture; but certainly it had nothing to do with the decay of the flower. The drop could be seen on the freshest flower. It was probably due to the abnormal growth of an ordinary cell, which became overcharged.

Mr Shevsuggested that one of the blooms should be sent to the Scientific Committee of the Royal Horticultural Society, who would give them the best answer they could possibly obtain. It would be an interesting point for them all

Mr. Orchand, speaking with regard to classification, said if they were going to drift into further sub-divisions he did not know where they would be landed by their next jubilee. As to the "hairs," he thought they were the result of an excess of protoplasm through over-development.

excess of protopusan through over-acceptance.

Mr. W. H. Fowler said he had always thought that the "hairy" section should be left with the Japanese, and that the former should not have a section entirely to itself.

Floral Committee.

November 9.—A considerable number of new varieties were staged on this occasion, and among them a few of exceptional merit.

First-class Certificates were awarded to Japanese Golden Elsie from Mr. Bugden, gr. to Sir Neville Chamberlain. Southampton a sport from Elsie, and shown under the name of Golden Ball, but as a variety of this name is already in existence the Committee named it Golden Elsie. It is very free, the flower small, finely shaped, and of a bright yellow colour. It was Certificated as a market variety, and will doubtless become popular. A similar award was made to Japanese Anemone Hugh H. Gardiner, a flower of a bright magenta-purple, coloured ray florets and bronzy cushion, from Mr. S. Ely, gr. to Hugh H. Gardiner, a flower of a bright magenta-purple, coloured ray florets and bronzy cushion, from Mr. S. Hy, gr. to Hugh H. Gardiner, Esq., Nettlebed, Henley-on-Thames; to Japanese Mnstapha, a large flower with broad pure white florets, somewhat incurving and flat, a highly promising variety, from Mr. C. Gibson, gr., Morden Park, Mitcham; to Japanese incurved Duchess of Fife, a large full flower with long, fairly broad florets, shown as an incurved variety, but considered by the Committee to belong to the Japanese section, from Mr. E. Molyney, Statemer Variety was also shown by Mr. W. Harvey, Chislehurst. First-class Certificates were awarded to Japanese Mrs. C. Orchard, a large incurving white flower, which in the centre is yellow—highly premising; and to Sarnian Gem, in colour orange-red, with golden reverse, a

large deep, ull incurving flower—extra fine; Matthew Hodgson, bright orange crimson colour -very promising, small as shown, but brilliant in colour, was Commended: it came from Mr. W. SEWARD, Hanwell. Incurved Golden Nugget, from Mr. R. OWEN, Maidenhead, was also commended; it is of the colour of Jardin des Pluntes, but of different build.

SOUTHAMPTON CHRYSANTHEMUM.

NOVEMBER 3, 4.—The Victoria Hall was again the site of the annual Chrysanthemum exhibition on the above dates. Both plants and cut blooms were present in large numbers, but probably the latter created the greater interest.

CHESTERFIELD CHRYSANTHEMUM.

NOVEMBER 3, 4.—The Chesterfield Chrysanthemum Society has only just completed its third year, but the shows it has held -notably the last prove that there is decidedly scope for such a society in the coal-mining district around Chesterfield. Gentlemen employing gardeners in the locality are taking an active interest in the welfare of the Society, and the public evince an encouraging disposition to patronise the annual exhibitions of the antunn blooms. The entries this year were nearly double the number last year, and there was a marked improvement in the quality of the exhibits.

EASTBOURNE.

Nov 0, 4—Looking back a couple of seasons, we note a wonderful improvement in the above show. Both in number and quality a very needful move forward has been made.

Groups, fruits, cut-flowers, and vegetables were excellent, as also were the many non-competitive exhibits. Mr. Jupp, gr. to G. Boulless, Esq., Eastbourne, was nost successful, not only gaining 1st and the National Chrysanthemum Society's Certificate for eighteen Japanese, but being well to the fore in many other classes.

HEREFORD FRUIT AND CHRYSAN-THEMUM.

Novemer 3, 4.—The fifth annual show of this society was held in the Shire Hall, Hereford, on the above dates. Apples an I Pears, for which about sixty classes were provided, in idea fine display, although they were not in such abundance as lest year, nor in size quite up to the usual Herefordshire standard; they were, however, remarkably fine in colour and free of blemish.

CHRYSANTHEMEMS (OPEN).

The best Group of theysanthenium was arranged by Mr. Williams, gr. to Sir J. Pelley, Lower Eaton; it was not over-crowded, the foliage being good, and the flowers large and well coloured.

Picety-ar Blooms, destruct, trenty four to be Jupanese,—1st, Mr. Lockyer, gr. to J. C. Handler, K. Esp., Pontypoo Park, who staged a fine lot of well-inished flowers, the hest being Chas. Davis, Mutual Friend, Madame Carnot, Duke of York, M. Moselleir, Empress of India, C. H. Curtis, and Princess of Wales; 2nd, Mr. Williams, gr. to Sir J. Puller, with good flowers of J. Wilkins, Col. Chase, Col. W. B. Smith, Eda Prass, &c.

Lactor Japonese. 1st, Mr. W. Davis, gr. to A. Wright, Esq., Quarry House, Newent, who had Mrs. C. H. Payne, Colonel Davis, Madame Carnot, &c.; 2nd, Mr. Williams.

Twilve Incurved, distinct.—In this class Mr. Lockyen and Mr. W. Davis were placed equal 1st. The former's best flowers were Princess of Wales, Queen of England, Empress of India, and Mrs. Chibran; Mr. Davis having Jeanne d'Arne, Miss M. A. Haggas, and Lord Alcester amongst his best.

The smaller classes of fruits and flowers were well contested, and the exhibits good.

Dried fruits were also shown in excellent condition by Mr. A. Trotter, gr to F. Recardo, Esq., Ledbury. As were also bottled fruits, by Mr. John Weaver, Chester. Thos. Combet

EALING HORTICULTURAL.

NOVEMBER 4.—The annual Chrysanthemum, &c., show, held in the Victoria Hall on the above date was, on the whole, a fairly good one. The Japanese varieties were a notable feature of the display, and of a high standard of excellence; the special exhibits (non-competitive) were noteworthy, and, as is usual at this society's shows, the prizes offered amongst cottagers were keenly contested.

COVENTRY CHRYSANTHEMUM.

November 4, 5.—The second annual Chrys aithemum show was held at Coventry on the above dates. The show was a complete success in every way, the entries were nearly double those of last year, and the quality of the exhibits in every class were very much better. The large half of the Corn Exchange was filled with beautiful specimens of Chrysanthemums, and the addition of Primules, first, and vegetables made an agreeable change. The principal prize-takers were G. Singer, Esq.; Sir Richard Moon; J. K. Stinler, Esq.; S. Loder, Esq.; Sir Richard Moon; J. K. Stinler, Esq.; S. Loder, Esq.; Sir Richard Moon; S. Stinler, Esq.; Sir Richard Moon, and others, which added greatly to the success Mr. F. Curis was an energetic secretary.

MARKET HARBOROUGH CHRYSANTHEMUM.

Nov. 4, 5,-This society held its annual show on the above dates, when the quality of the exhibits was a little below the standard of previous years. The following were the chief

The class for a group of Chrysanthemums arranged for effect with foliage and flowering plants, was won by Mr. Duncan; followed by Messrs, Plowman & Son, who were successful in a competition for a group of Chrysanthemums alone.

There were five entries in the class for eighteen cut blooms of Japane e, and 1st prize was gained by Mr. Pearce, gr to T. Loder, Esq., Hove Avenue, Northampton. The best twelve white Japanese were from Mr. Woon, Delapre Abbey; Mr. Pearce was 2nd.

Mr. HOYLE was list for twelve Japanese blooms distinct; and Mr. HOBLIN for eighteen incurved blooms. For twelve incurved blooms Mr. HOYLE was an easy 1st.

Vegetables were very good. In Messrs, Sutron's competi tion for six distinct varieties, Messrs (four $\rho_{\rm s}$ Barroot and Kemeshan $\rho_{\rm t}$ were the winners

Fruit exhibits included Grapes, Apples, and Pears.

Primulas were shown by Wessis Duneys and Wilson; Cyclamen by Mr. Wilson; and Solanum by Mr. Kempshyll

A pleasing feature at this show was the sale of some fruits, flowers, and vegetables for charitable purposes

WOLVERHAMPTON CHRYSAN THEMUM

November 4, s-The fourth annual show of this society was held in the Drill Hall, Wolverhampton, on the above dates, and was a great success. The blooms staged were excellent, and the company showed their appreciation by attending in thousands. The show was opened by the Mayoress, attended by members of many of the county families. The chairman of the committee, Mr G A Bishop, Wightwick Minor, and his colleagues, have, in the short space of four years, worked up one of the most prosperous societies in the country. The total number of classes in the schedule numbered forty, and these were well filled. So encouraging also was the prize-list, that growers from all parts competed for the coveted honours.

In the non-competitive section, Messrs, Dorbie & Co. Rothesay, sent a collection of Japanese blooms, both show and Rothesay, sent a concetton of a quantese blooms, both show and decorative, for which a Certificate of Merit was awarded W. Hattos, Esq. Hill Grove, Kidderminster (gr., Mr. T. Poolo), sent a fine collection of twelve bunches of Black Grapes, superbly finished; and he was awarded a Diphone. and Gold Medal for these.

A fine collection of twenty dishes of Apples, and ten dishes of Pears, were sent by A. L. Vernson, Esq., Hylton Park, Wolverhampton (gr., Mr. John Boulby), Certificate and similar award; a like award being made to Messrs, Thomas Rivers & Sons, Sawbridgeworth, for twenty-five dishes of Apples, and eighteen dishes of Pears. Certificate of Merit to Messrs. Tom B. Doms & Co., nurserymen, Wolverham, for, for a mixed exhibit of Palms, hardy shrubs, Chrysm-thennums, and vegetables, including some fine fruits of Blair's Prolifi : Cucumber.

Blair's Prolifi Cucumber.

The competitive groups were very fine, and the 1st prize went to I' G Barre, Esq. Waterdale, Compton, Wolverhampton gr., Mr Shingler), whose group contained fine Idooms of Sunflower, Duchess of York (fine flowers), forke of York, Charles Davis, Wm Tricker, Viviand Morel, Amiral Avellan, Madame Carnot, La Boule d'Or., 2nd, 8-1 Massore, Esq., Wightwick Manor Wolver hampton (gr. Mr G. A Bishop), who staged good plants of Madama Carnot A Payne, Viviand Morel, Etoile de Lyon, Col. W B. Smith, Charles Davis, Louise, &c. Decorative groups of Chrysanthemanns and other plants mingled, as 1st L. Horroy, Usan, Bessot (gr. Mr. S. Horton), with a weil L. Horros, Usq., Bescot (gr Wr. S. Horton), with a well arranged lot of plants, among which were Coces plumosa, Banboos, Pandanus, Euphorbia, Eulaha, Eucharis, and some well flowered Orchida, &c.: 2nd, E. W. T. Jones. Esq., The Oaklands, Wolverhampton (gr., Mr. W. Rudge), whose group contained good Coeos Wedelliana, Chrysanmums, and Orchids in variety.

Cheg authorane. In the class for three specimen Aspanese dissimilar, Alderman Gronor Thomson, Priory House, Dudley, was 1st; 2nd. Mrs. Evar. Dunstall Hall, Waterdale (gr., Mr. U. Jones).

(gr., Mr. U. Jones).

Cut Blooms.—These were well contested. The first twentyfour incurved toeined an exceedingly full stand shown by
H. H. France, Havin est, Esq., Overly, Wellington (gr., Mr.
S. Brenniell); 2nd. R. W. Havina, Esq., whose stand contained similar varieties to the winning one.

In the class tor twenty-tour J quases varieties, 1st, H. H.
France-Haviners, Esq., R. W. D. Havinay, Esq., being 2nd,
W. Daguers, Esc., Polymore (gr., W. J., Purker), was let for

W. Roberts, Esq., Pedmore (gr., Mr. J. Parker), was 1st for twelve incurveds, showning good blooms, H. H. France. Havmonse, Esq., was 2nd.

Front was shown in some quantity by gentlemen resident the district, but nothing that calls for any comment from us, nor do the tale vigetables which formed part of the

One notable feature was the table in aid of the Gardeners' Royal Benevolent Institution; this was taken in charge by Mr. Richard flows, Mrs. Bisnor, and Miss Lowe, plants, cut flowers, and fruit being contributed for sale by some of the exhibitors, and others - It is satisfactory to note that a good sum of money was obtained for this essentially gardeners' institution.

HARROGATE CHRYSANTHEMUM.

NOVEMBER 5,-The second annual show of the Harrogate Chrysanthemum and Paxton Society was opened in the Drill Hall, Harrogate, on the above date. The entries were more numerous than last year, and besides Chrysanthemums there was an excellent show of fruits and vegetables. The groups of plants in the open classes were very striking features

The 1st prize for the best group of Chrysanthemums, arranged in a half-circle not exceeding 50 feet, was awarded to Mr. E. B. Faber, J.P., of Belvedere, Harrogate; the 2nd went to Mr. J. Pettinger, Strawberrydale Nurseries; and the 3rd to Mrs. WITH IM, Stafford House, Harrogate.

The 1st prize for the best group of miscellaneous plants, not exceeding 100 square feet, arranged for effect, was won by Mr E. B. Faber, who also won the 1st in the next class, a group not exceeding 60 feet; Sir Prio IVAL RADGLIFFE and the Rev. T. Sheepshanks taking 2nd prizes.

The winners in the cut flower competitions were :-

The winners in the cut nower competitions were. —

Cut Blooms.—Thirty six distinct varieties (eighteen incurved eighteen Japanese): 1st, A Milnthorpe, Harrogate;
2nd, A Clark & Son, Rodley. Twelve incurved: 1st, C H

Simpson, Ackworth, Pontefract; and 2nd, A Milnthorpe.
Twelve Japanese: 1st, A. Milnthorpe. Six Japanese, distinct: 1st, A. Mulnthorpe. Six incurved, distinct: 1st, C

H Simpson Six reflexed, distinct: 1st, Messes, A. Clark &

Some and C H Simpson. Six Japanese, thermore, 1st. thet: 1st, A. Minthorpie, Six meurved, distinct: 1st, C. H. Simpeson. Six redeved, distinct: 1st, Messrs, A. Clark & Son (2nd. C. H. Simpson. Six Japanese, Anemone 1st, C. H. Simpson. Epercue for dinner table, Chrysanthemums, any foliage allowed 1st, R. Hutchiuson, Kirby Overblow Basket of Chrysanthemums, with any kind of foliage; 1st, E. J. Butchelor, Harrogate.

DEVON AND EXETER HORTICUL-TURAL.

November , a -The one-hundred and eighty fourth exhibition of this society was held in the Victoria Hall on the above dates. Circular groups of Chrysinthemum plants, arranged on the floor of the large hall, had a very good effect. Trule exhibits helped largely towards the general effect, and the numerous dishes of Apples furnished rich colouring. Cut blooms were staged in a separate hall, but in this section a slight fulling-off in quality and numbers was apparent. The reflexed and Anemone varieties were poorly represented, no exhibit of the former being staged, and but one of the latter.

 ${\it Groups}, -\ln {\it the class}$ for groups arranged for effect, there were three exhibits, Mr Rowkind, gr. to W. Brock, Esq., Parker's Well, Exeter, being a good 1st. In the centre of the group he had a graceful plant of Cocoa plumosus, while the Chrysanthemous were of good quality, very fresh, and the colours bright, and all nicely finished off at the loss with Adiantum, &c.; 2nd, Mr. Williams, gr. to V.D. Sinn, Esq., who had also well-flowered plants, but the group Esq., who had also well-flowered plant lacked the finish of the preceding exhibit

Mr. ROWLAND was the only exhibitor of a group of Chrys anthemums in pots grown in a natural way, and was awarded the 1st prize.

Groups of miscellaneous plants, in which not more than twelve Chrysauthemums were admitted, formed a pleasant feature. They were arranged in diamond shaped groups, on slightly raised starely placed across the centre of the Hall, and Mr. Rowt via was again the most successful exhibitor; and, Mr. Prothero, gr. to Mark Farrant, Esq. A class for twelve Chrysanthemum plants, in 6 in h pots.

but only a tew of them were good; on the other limit, violets in pots were numerous, and in the limit, violets in pots were numerous and good. The lst prize e hibit was shown by Mr. Abruns, pr. to T. Kekewich, Bouvardies, Solumnos, &c., were numerous.

Cut Bloom - In the principal class, that for thirty ski Japanese, distinct varieties, the 1st prize consisted of a Silver Cup, f i which eight competed, Mr. G. Foster, gr. t i H. HAMMOND STENCER, Esq., Teignmouth, taking the 1st position with a collection of meritorious flowers, well set up, position with a collection of meritorious flowers, well set up, and comprising the following varieties amongst others.—Australie, Graphic, Princess May, Robt Owen (fine), Silver King, Oceana, Miss Dorothea Shea, Madame Ad Chatin, Miss E. Addison, Mr. J. Hollingworth, Van den Heede, Madame Carnot, Deuil de Jules Ferry, Mutual Friend, Duke of York, Mrs. C. II Wheeler, Mons Chemon de Leché, John Seward (good), Madame E. Capitant, Phoebus, and Miss E. Teichmann. Mr. Wilkins, gt. to Lady Theorora Gress, was a good 2nd, having, among others, very fine Phoebus, Mrs. J. Shrimpton, and Madame A. Chatin; 3rd, Mr. Mairs, gr. to Sir, I. Shelley, Bart., whose stand lost much in effect through the low and flat setting up of the blooms.

For eighteen Japanese blooms, Mr. T. Hill, gr. to the Rev. T. Herentss, was 1st in a close competition, having good.

For eighteen Japanese blooms, Mr. T. 1101, gr. to the Rev. T. Huchuss, was 1st in a close competition, having good flowers of the following varieties. Madame Carnot, Edith Tahor, Duke of York, M. G. Biron, Madame A. Chatin, M. Chenon de Leché, Australie, Lord Brooke, J. C. Schwale, Miss Dorothea Shoa, M. Gruyer, and Melle, A. Galbert, 2nd, Mr. Foster, in whose stands were note-wortly flowers of several varieties.

For twelve Japanese there was a strong competition, Mr. Mains being 1st with a good stand, among which Madame Carnot, Miss Dorothea Shea, and Primrose League, were noticeable blooms; 2nd, Mr. G. Lane, gr. to T. TURNER, Esq., Cullompton.

Incurved blooms were not largely represented. In the class for twelve distinct, Mr. Stiles, gr. fo Miss Fripp, Teignmouth, was 1st, with medium-sized flowers; 2nd, Mr. FOSTER.

Mr. PROTHERO was 1st for a stanl of six bunches of singles, with Gold Star, Snowflake, Queen of Singles, Calliope, Tisiphone, and Souvenir de Londres.

Miscellaneous Exhibits of a non-competitive character considerably added to the attractiveness of the show. Messrs. R. VEITCH & Son staged fifty dishes of highly-coloured Apples and various plants, including the pretty winter-flowering Begonia, Gloire de Lorraine. The Exeter Nursery Co.'s exhibit included a fine collection of well-grown Chrysanthemum plants, intermixed with ornamental-leaved plants.

Mr. C. J. Sclater, Devon Nurseries, staged eighty dishes of Apples. Messrs. Jarman & Co., Chard, also exhibited a large collection of Apples.

Fruit - Forty-three classes are devoted to fruit at this Frait - Forty-three classes are devoted to truit at this exhibition, chiefly Apples and Pears, the classes heing arranged very much on the lines of the Crystal Palace show of the Royal Horticultural Society, many being devoted to single dishes. Compare I with this exhibition, however, the Devon samples fell considerably behind as regarded size,

although, taken as a whole, the colour was perhaps better.

For three bunches of Alicante Grapes, seven good stands were tabled. 1st, G. W. MATTHEW, Esq., Exmouth, whose exhibit was stated to have been grown without artificial heat; 2nd, Mr. Davey.

Mr. Seward, gr. to Sir J. D. Ferouson Davie, Bart, was a good 1st for Muscats, and also for three bunches of any other variety with good Gros Maroe; Mr. Daves being 2nd, with fine Gros Colman

The competition was very keen in the class for thirty dishes

The competition was very keen in the cass for unity disnes of Apples, distinct, Mr. Seward being again successful in winning the 1st award with a very even collection; Mr. Garland, gr. to Sir T. D. Acland, Killerton, was a good 2nd, For twelve varieties, Mr. Cornish, gr. to W. Ministe, Esq., was 1st; and for six varieties, Mr. T. Stark, gr. to the Hon Lady Wilkond, was 1st. Among nine lots of Blenheim Orange Pippin, Mr. State was 1st.

Pears were shown in fewer numbers, although some very

fine samples were staged. Mr. Garland was a good 1st for mne varieties, six dessert and three culinary.

WINDSOR CHRYSANTHEMUM.

November 5, 6. - The lifth annual autumn exhibition was held in the Albert Institute, and was a successful one, Groups of Chrysantheniums were a distinct feature, the plants being dwarf, thoroughly well suited for the purpose, besides being plentifully clothed with foliage; while they carried good blooms. The arrangements were in every way satisfactory.

Mr. Cole, gr. 40 Mrs. E. B. Foster, won premier position; and Mr. Wood, gr. to Lord Bosrox, Hedsor, was 2nd. To the 1st prize group was also awarded the Bronze Medal, given by the National Chrysanthemum Society for the most mari-torious exhibit of Chrysanthemums in the show.

Mr. R. Cawte, gr. to W. B. Aventy, Esq., staged the finest specimen plants. They were well-grown examples of leading

A Silver Challenge Vase was offered for one naturally-grown plant, and this was won by Mr. P. J. Paul, gr. to Mrs. Bowkeino, who had clarge plant of W. Tricker, profusely

NOTTINGHAM AND NOTTS CHRYSANTHEMUM.

November 6, 7 -A very successful exhibition by this Society was held on the above dates in the Mechanics' Hall. Although there were only three competitors in the open class for twelve incurved and twelve Japanese blooms, distinet varieties, Mr. Goodaere, gr. to the Earl of HARRING The varieties, St. Goodacre, gr to the Earl of Harriage Ton, was well deserving of 1st place. Among Mr. Goodacre's Japanese blooms, however, were none equal to Mr. Shlas Cole's Mutual Friend, with which Earl Spencer's gardener carried off the prize for the champion Japanese bloom. Mr. Cole's incurved blooms were, however, unequal to those of Mr. Goodacre, but his exhibit was well worthy of 2nd prize;

and place being taken by Mr. W. Ball, gr. to Mr. R. Enfield.
This is the first year in which prizes have been offered for balcony decoration with groups of Chrysanthemums, and of the two competitors Mr. J. Folgman displayed the best taste in the matter of arrangement. Mr. Yarnell, gr. to Mr. J. W. TURNER, accomplished a very creditable performance in carrying off 1st prize in four of the open classes for specimen

plants, and for a table decoration.

Mr. F. Cox had some splendid blooms in the first of the classes open to all members, amongst his incurved Chrysan-theniums being specimens of Alfred Salter, Robt Petfield,

and Lord Alcester, while included in his six Japanese were a line Madame Carnot and a equally good Viviand Morel.

For some years Mr. J. Bell has been an exhibitor, and now he has been rewarded, his blooms, which placed him and to Mr Cox, being a great credit to him, his M. Chenon de Leché being particularly noticeable. In the next four classes, both the incurved and Japanese blooms were excellent, and altogether the entries were quite satisfactory. It was, however, in the artisan classes that the entries were the most numerous, and in one case there were as many as fifteen, while in another there were but two less. An interesting exhibit, and one which demonstrates that even outdoor some very nice Chrysanthemums may be grown, is that staged (not for competition) by Mr. C. Shaw, who has previously proved himself an excellent grower of the summer nd autumn varieties of this plant.

LOUGHBOROUGH CHRYSANTHEMUM AND FRUIT.

NOVEMBER 6, 7.—The efforts made earlier in the year to bring about the amalgamation of the two societies into which the original Loughborough Chrysanthemum and Fruit Society had split having been successful, the annual show of the once more happily united members was opened on Friday afternoon, November 6, at the Loughborough Corn Exchange. Although the weather has not been over favourable to the growing of Chrysanthemums, the specimens sent in were of exceptionally fine quality, many very beautiful blooms being staged.

In the open classes Mr. J. SMITH was the most successful exhibitor, carrying off no fewer than five out of the possible six 1st prizes, and thus winning the Bronze Medal awarded by the National Chrysanthemum Society this year to each of the affiliated societies in celebration of the jubilee of its existence.

In the amateurs' classes the National Society's Certificate - awarded to Mr. Bonkows. The amateurs' and cettagers' classes were well filled and the competition in nearly every case was excellent. A fine collection of fruit was exhibited.

KINGSTON-ON-THAMES CHRYSANTHEMUM.

November 10, 11.—This well-known society held its twentieth annual show on the above dates, and as usual in the spacious Drill Hall. The show was better furnished with trained plants than has been the case for some two or three years. The miscellaneous groups, although pretty, are invariably at this time of the year dull, lacking floral colour whilst the Chrysanthemum groups were of the usual solid stereotyped order, giving fine, but very formal banks. If these two groups could be blended, the prizes added, and half as much space again given to each, some splendid groups might result. As next year will see the society's majority, a good opportunity will offer for some break in the monotony of perennial classes.

Plant Groups.—The best one of miscellaneous form was arranged by Mr. Ridge, gr. to C. Swinken Eady, Esq., Weybridge, light and graceful, but wanting more colour.

Chrysanthemum Groups were of the usual order, but the one set up by Mr. Forbes, gr. to D. Nichol, Esq., Surbiton, if formal, had a well-raised point, and sloped down to a double edging of La Petito Amie, a white Japanese in 6-inch pots, the plants 18 inches in height, and capitally flowered. The general quality of all Mr. Forbes' Japanese flowers was excellent. Mr. W. French, gr. to Mrs. Barchay, Wimbledon, was 2nd; and Mr. G. H. Sage, gr. to Earl of Dysaet, flam House, 3rd.

Trainet Plants.—The best six of these came from Mr. J. Swan, gr. to G. Murray Smirn, Esq., Weybridge, who had really good specimens, not too big, of Mrs. G. Rundle, Dr. Sharpe, W. Tricker, Viviand Morel, Sunflower, and J. Salter. Mr. S. Pead, gr. to R. S. Bonn, Esq., Surbiton, was 2nd, but his plants were far too hardly tied, and short of bloom.

Mr. J. Plowman, gr. to C. Lavers Smith, Esq., Long Ditton, had the best three trained plants in unnamed varieties.

The finest three large-flowered standards came from Mr. F. Kiog, gr. to A. F. Perkins, Esq., Holmwood, who had Richmond White, Christine, and Chinaman; Mr. Watkins, gr. to R. W. Monao, Esq., Coombe Warren, coming 2nd.
Mr. Swan had the best four trained Pompons in Golden

Mr. Swan had the best four trained Pompons in Golden Marthe, M. Montels, W. Westlake, and Snewdrop.

Primulas.—Mr. Mileham, gr. to A. T. MILLER, Esq., Leatherhead, had the best six doubles, fairly well bloomed; and Mr. Pead the best singles, of fair quality. The best six Bouractius came from Mr. Atkins. Mr. Maxgrega, gr. to the Dowager Lady Hav, Putney, had the best nine table-plants, a pretty selection; and the best berried plants, pretty erect bushes of Solanums came from Mr. Atkins; large fruited Capsicums, from Mr. Farnen, coming 2nd; and well-fruited Physalis Alkekengi, from Mr. Sen, 3nd.

Cut Flowers: The Challenge Vase.—The new Vase, a very handsome silver fruit-bowl, was on this occasion competed for by but four competitors, the interest the competition once created being now much discounted elsewhere. It was won this time by a worthy exhibitor, who has frequently tried hard—Mr. G. Hunt, gr. to P. Ralli, Esq., Ashtead Park. His incurved, really a capital lot of blooms, included Duchess of Flife, very fine; J. Agate, Alfred Salter, W. Tunnington, S. Coleman, Norman Davis, C. B. Whitnall, Lord Alcester, Globe d'Or, Empress of India, John Lambert, C. H. Curtis, M. C. Kingston, Robert Petfield, and J. Salter. And his Japanese included good blooms of Madame Carnot, Viviand Morel, Jas. Myers, Madame A. Chatin, M. Pankoucke, Edith Tabor, Malame Gruyer, W. C. Mewett, Silver

King, A. Molyneux, Mr. W. H. Lees, Ch. Dawes, Rose Wynne, &c.; Mr. W. Jinks, gr. to Edgar Bruck, Esq., Watton, was 2nd, having in his stand the premier Japanese, a beautiful Madame Carnot; Mr. F. King was 3rd.

Incurved Blooms.—The best twenty-four, capital flowers, were staged by Mr. Higgs, gr. to J. B. Hankey, Esq., Fetcham Park. He had Chas. Curtis, a superb flower, and premier of the section; also Major Bonnaffon, too like the preceding; W. Tunnington, M. C. Kings on, Globe d'Or, John Lambert, Princess of Wales, Miss Haggas, Empress of India, Percy Norman, all good. Mr. G. Hunt came 2nd, with excellent flowers; Mr. Jinks being placed 3rd.

With twelve incurved, Mr. F. Kino was 1st, having Robert Cannell, Lord Alecster, Empress of India, Golden Empress, Globe d'Or, Robert Petfield, J. Agate, C. B. Whitmall, Ch. Curtis, Queen of England, Miss Haggas, and Mrs. H. Kingl; Mr. A. Felgate, gr. to the Dowager Duchess of Wellenkington, Walton, was 2nd.

Mr. Springthorpe, gr. to W. A. Bevan, Esq., Coombe Warren, had the best six blooms in Baron Hirsch, Ch. Curtis, Globe d'Or, J. Agate, Princess of Wales, and Jeanne d'Arc; Mr. MILEHAM was 2nd.

The best six blooms of one variety were broad, but rather flat Ch. Curtis, from Mr. Springthorner; fair Empress of India coming 2nd, and Globe d'Or 3rd.

Jupans to Blooms,—Mr. Hums was again 1st with a fine lot of flowers in the class for twenty-four, having Mille Marie Hoste, Chas. Davis, Ethel Addison, Hairy Wonder, International, M. Chenon de Leché, Mille. Ricoud, Viviand Morel, Madame Carnot, M. Pankoucke, and Mrs. C. E. Shea of the best; Mr. Coombes, gr. to W. Ferze, Esq., Teddington, was 2nd, having very good Miss W. T. Drewett, C. Shrimpton, Mutual Friend, and others; Mr. J. Hust was 3nd.

Twelve Blooms. Mr. F. King led here with good Madame Carnot. Miss Elsie Teichmann. Viscountess Hambledon, Madame Therese Rey, Phobas, M.C. Molin, and others; Mr. J. Cook, gr. to S. Sandon, Esq., Walton, was 2nd; and Mr. H. Squelch, gr. to W.C. Bond, Esq., Dorking, was 1rd. Mr. MOSTREMAN had the best six Japanese, Mr. J. Plowman coming 2nd; and with six blooms, one variety, Mr. Springer-Houre was again 1st, having the rich yellow Phobas in fine form; Madame Carnot, from Mr. Cook, coming 2nd.

Reflexed. These were few, and seem fast going out of cultivation. Mr. II Hawkes, gr. to G. B. Tarn, Thames Ditton, had the best twelve, in quite old varieties; Mr. Pitcher, gr. to W. M. DUNNAGE, Esq., Surbit m. coming 2nd.

Aurmone, large-flowered, made a strong class, the flowers being exceptionally good. Mr. W. Jinks was 1st with twelve blooms, including J. Bunyan, Enterprise, Delaware, M. Dupanloup, Madame Cabrol, W. W. Astor, Sir W. Rale gh, &c.; Mr. A. Turner, gr. to C. F. Murray, Esq., Epsom, was 2nd. With twelve Pompons in trebles, Mr. Cakyen was 1st with good blooms of Perle des Beautes, Osiris, W. Westlake, Charles Dickens, Prince of Orange, La Vogue, &c.; Mr. Prowman being 2nd. The latter had the best Ancimone Pompons.

Singles in trebles made a very telling class, Mr. Aleboare coming 1st, having Henfray, Jessie Carpenter, Miss Brown, Yellow Giant, D. Wimbor, Duchess, Elizabeth, &c.; Mr. Forises was 2nd. The latter had the best eighteen bhouns in trebles of the three Rundles, making a nice class. A First class Certificate was awarfed by the judges to dapanese Mrs. Widnig Grant, very similar to M. Chenon de Leche, shown by Mr. Janks as a seedling.

Fruit and Vigitables. The best collection of four dishes came from Mr. C. J. Watte gr. to the Hon. Col. Talbor), Esher, who had Alicante Grapes, Coe's Golden Drop Plams, still good; Benrré Diel Pears, and Cox's Orange Pippin Apples. Mr. G. H. Sagi, was 2nd. The latter had the best four dishes of Pears, in Benrre Bichelier, Easter Benrre, Duchesse d'Angoulème, and I'vedale's St. Germain. Mr. Sage also had the best six dishes of Apples, Lord Derly, Emperor Alexander, and Prince Albert, and Cox's Orange, Bleinheim and Ribston Pippins, all good. Black Grapes were very few; the best were good Gros Colman, coming from Mr. Elliott, gr. to Capton McDonald, West Moulsey; and Mr. G. A. Cole-Fettam had the best White in fair Muscat of Alexandria. Mr. W. Taner, Hampton, and Mr. J. Miller, gr. to Lord Foren, Ruxley Lodge, showed excellent collections of fruit.

Vegetable competitions were limited to six kinds only, in large baskets, and Mr. C. J. Wa(11) was, as usual, an easy 1st. Many smaller and local general classes have to remain unnoticed. The weather was excellent and the attendance large. The new secretary, Mr. Victor Donet, seems to have given every satisfaction.

Obituary.

JOHN EDWARD GRAY.—On the 8th inst., suddenly, at Naples, the day after his arrival there to occupy the Cambridge University table at the Zoological Station, John Edward Gray, E.A., Scholar of King's College, Cambridge, second son of S. O. Gray, of 71, Belsize Park Gardens, N.W., and greatmephew of the late Ph. John Edward Gray, of the British Museum, aged twenty-two years.

VEGETABLES.

SUTTON'S FAVOURITE CABBAGE LETTUCE.

I was able to cut from plants ont of doors the first week in the present month (with only a little protection at night) heads of this valuable variety. They were raised from seeds sown at the end of the month of July, and transplanted to a south border. They were ready for use as soon as the Cos varieties were over. Where Lettnee is in demand all the year round, as it is here, this variety cannot be too highly valued. It is of excellent flavour and good in colour A. B. Wadds, Clivedon, Backs.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

 Scotland N. Principal Wheat-producing Districts—
 Scotland, E.; 2, England, N.E.; 3, England, E.;
 Midland Counties: 5, England, Including London, S.
 Principal Grazing, &c., Districts—6, Scotland, W.;
 England, N.W.; 8, England, S.W.; 9, Ireland, N.;
 Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending November 7, is furnished from the Meteorological Office:—

"The weather during this week was mostly fine and bright, but showers were experienced in many places during the early days of the week—especially in the north-east—and considerable quantities of rain fell very generally at the close of the period. Thunder and lightning occurred at some of the extreme southern stations on Sunday.

"The temperature was again below the mean, the deficit ranging from 2' in 'Scotland, N.,' and 3' in 'Scotland, E.,' to 5 or 6' in many other districts; and to 7' in 'England, S.W. and treland, S.' The highest of the maxima were recorded on rather variable dates, and ranged from 55' in 'England, S.W.,' to 50' in the 'Midland Counties.' The absolute minima, which occurred generally about the middle of the week, were again very low; they ranged from 10' in the 'Midland Counties.' 'Scotland, W.,' and 'England, S.W.,' to 24' in 'Scotland, N. 'and 'England, N.W.,' and to 34 in the 'Channel Islands.' The lowest reading, reported from instruments exposed on the grass, was 14' at Worksop on the 6th and 7th

"The rainfall somewhat exceeded the mean in 'England, N.E.,' and just equalled it in 'England, E ;' elsewhere, the fall was less than the normal; and over Ireland and the south-west of England the deficiency was very large.

"The bright smaller in exceeded the mean in all districts excepting 'Scotland, N.' The percentage of the possible duration runged from 44 in 'England, S. and S.W.,' and 42 in 'England, L., t. 25 in 'England, N.W.,' and t.12 in 'Scotland, N.'.

LAW NOTES.

THE AGRICULTURAL RATES ACT.

THE market-gardeners in the Brentford and Richmond Unions are already being furnished with evidence that their position under the new Agricultural Rates Act is not all they had been led to believe it would be. The Brentford Union Assessment Committee recently instructed the overseers of the different parishes in its large area to prepare lists of property to which the Act might be applied, and engaged an assessor, upon whose report all glasshouses and land under glass were included as being entitled to contributions from the Imperial Exchequer. This view was arrived at upon a careful consideration of the Worthing case, which was read as holding that the presence of glass on land does not alter the agricultural character of the land. To this view the surveyors of taxes demur strongly, and, acting under the instructions of the Board of Inland Revenue, are appealing against the arrangement. In Richmond a conference has been held, and the view there was strongly in favour of concurring in the view of the Iuland Revenue authorities. This wide divergence of opinion leaves apparently open only one course -- recourse to Quarter Sessions, and the Brentford Union Assessment Committee express the view that they will not alter the position they have taken up until an adverse opinion is given by the higher authorities. Another view the surveyors of taxes take is, that occupied buildings upon land are to be assessed for local rating purposes at nothing below the figure they are assessed at for the house duty. The effect of this is in several cases to make the assessment of the house alone greater than that for the entire holding, and to absorb in the house, for which no grant is of course given by the Government Exchequer, the value of the land, and so prevent the holder of the latter receiving that benefit which the Act contemplated he should have. The Assessment Committee, moreover, cannot give him any help by adding a fresh assessment to his land, as they are by the Act, bound to leave the assessment of the whole holding as it is at present, and neither make it greater nor less. Consequently, if the views of the surveyors of taxes are correct, and the Assessment Committee accept them as such, the gardener who happens to have a habitable building on his land stands a chance of losing a grant in aid of his rates for five years, and even if he should appeal, as he has the right to do as soon as the lists under the Act are published, and succeed in inducing the Assessment Committee to lower the assessment on the house, he would be too late to derive any benefit. This point again is put forward by the Inland Revenue authorities, and nothing less than an appeal to the law courts will decide the question. Obviously it behaves gardeners themselves to look into these questions, and themselves procure such information as can lead them to help those who are trying to protect them against the construction of the Act as applied by a Government department.

MARKETS.

COVENT GARDEN, NOVEMBER 12.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply m the market, and the demand; and they may fluctuate, not only from day to day, but often sever dimes in one day. Ed.]

SEEDS.

LONDON: November 11. -Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's murket inactive. Clover seeds are for the moment receiving less attention; meantime values, all along moment receiving less attention: meantime values, all along the line keep steady, whilst American Bed is cabled higher. Italian Rye-grass is firm, at the laterise. As regards Turkish Canary-seed, the remarkable upward movement in freights has quite stopped shipments to England. The new Hemp-seed comes good and cheap. There is no alteration in either Mustard or Rape seed. Some fine Canadian Haricots just landed showing good quality, and being reasonable in price, attract attention. Full rates are realised for White Rec attract attention. Full rates are realised for White Runners. Linseed is dall. The Board of Trade Returns give the imports of Clover and grass-seeds into the United Kingdom for the first ten months of this year as 317,708 cwt , value 6609,350; as against 309,94; cwt , value £688,741 for the corresponding period of 1895.

FRUIT AND VEGETABLES.

FRUIT AND VEGETABLES.

Vegetables: Turnips, white, 2s. to 2s. 6d. do. per dozen bunches; do., Swedes, 1s. to 1s. 3d. per ewt.; Savoys, 1s. to 1s. 3d. per dozen; Cabbages, 8d. to 2s. 6d. do.; do.; tate, 1s. to 1s. 6d. do.; do.; Red. 2s. 6d. to 3s. do.; Canliflowers, 2s. to 2s. 6d. do.; Parsains, 4s. 6d. per ewt.; Herbs, assorted, 1d. to 2d per launch; Lecks, 1s. to 2s. 6d. per dozen bunches; Mint, green, 6d. per bunch; Onions, Datch, 3s. to 3s. 6d. per bag; do., Portugal, 1s. per stone; do., Globe, 3s. to 3s. 6d. per ewt.; Parsley, 5s. to 6s. do.; Greens, 4d. per bunch; Celery, table, 2s. do.; do., common, 9d. to 1s. do.; Potatos, best, 8d. per stone; Carrots, 2s. 6d. to 3s. 6d. per ewt.; Artichokes, 10s. to 1s. do.; Caumbers, 4s. to 4s. 6d. per dozen; Lettuces, 6d. to 9d. per dozen; do., Cos, 9d. do.; French, 1s. do.; Radishes, 9d. to 1s. per dozen bunches; Horserabsh, 2s. 6d. per bunch; Booal Beans, 1s. to 1s. 6d. per stone; Freach Beans, 4d. to 6d. per peck; Starlet Runners, 1s. 6d. per stone; Mushrooms, 1s. to 1s. Sol per 1b.—Averages of prices at the following markets: —St. John's: Putatos, 8d. to 1d. per stone; Livernoot.

Liverpoot: Nonember 11.—Averages of prices at the following markets:—St. John's: Potatos, 8d. to 1nd. per peck; Grapes, English, 1s. to 2s. 6d. per pound; do., foreign, 6d. to 8d. do.; Pines, English, 4s. to 8s. each; Mushrooms, 1s. per pound. Birkenhead:—Potatos, 6d. to 8d. per peck; Grapes, English, 2s. to 3s. 6d. per pound; do., foreign, 4d. to 6d. do.: Pines, English, 4s. to 6s. each.

ENQUIRY.

"He that questioneth much shall learn much."-BACON.

HORE SYLVANE.—Studies of the Forests, &c., of North-west America, by R. Brown. Who was the publisher of this book, and where can a complete copy be obtained? Massachusetts.

Notices to Correspondents.

*** We have received reports of Chrysanthemum shows held at Hull, Brighton, Lewes, and many other places, which we are quite unable to notice in the present issue, through insufficiency of space.

Begonia Roots Eaten: A. H. M. Weevil grubs, probably Otiorhynchus. Remove all the present earth, and burn it, together with any plants badly infested. Carefully wash the roots in Gishurst Compound, or with some other insecticide before replanting. As the perfect weevils feed at night, shake the plants after dark over a sheet of paper, and destroy the insects. R. McL.

BLACK CURRANT BUDS DISFIGURED: Main & Co. The buds are infested by the Currant-bud mite. The mites will spoil the whole of the bushes another year if you do not cut off and burn the affected shoots, and spray the bushes now and in the spring with petroleum emulsion. To make the emulsion, take soft-soap 1 lb., petroleum ½ pint, and water 3 gallons. First dissolve the soap and the water, then add the oil, and keep the whole well agitated whilst using it.

"POTANY FOR BEGINNERS": J. W. W. We think this is out of print. Apply to Messrs. Bradbury, Agnew & Co., Bouverie Street, Fleet Street.

BRIAR STOCKS WITH BUDS OF TEA ROSES INSERTED IN THEM: IV. H. B. In mild winters no harm will accrue to the buds, but in a severe one it will be advisable to fasten some strawy litter or bracken round the stock at the part in which is the bud, or bend the head of the stock down into a hole thrown out to one foot in depth, cover with soil; secure the plant in that position with a stout peg, and cover the stocks with litter.

CATTLEYA SHEATHS NOT DEVELOPING: Pomona. It is probable that your Cattleya labiata produced more buds than it could develop, and hence some have expanded and some failed.

CELERY ROTTING AT THE HEART: A. U. S. When this occurs at the present season, it is usually the effect of depriving the heart-leaves of light whilst growth is still active. This is brought about by a too rapid earthing-up, and the decay commencing with the leaves extends downwards to the root. It would occur with any variety in any kind of soil.

CUCUMBERS IN ILL-HEALTH: C. F. R. There is not the slightest trace of Bacteriosis or of any fungus disease in your Cucumbers. The foliage is very much spotted, but the spots are not caused by fungus, and there is no trace of mycelium. Close microscopical examination has failed to furnish any clue to the mystery, which can only be found on the spot. M. C. C.

FORCING HELLEBORUS NIGER: T. J., Constant Reader.
The plant will not bear much forcing, and it suffices to pot up the clumps, and place them in a light position in the greenhouse or pit, with a minimum degree of warmth of 45', to have them in flower in December. They are better for being established in pots or small tubs, one or two years in advance. The plant is showing its flower-buds even at the present time on out-of door plants.

Hollies: K. G. M. Unless you can transplant them with large balls they should remain where they now are till April.

INSECT: A. H.—A plant-long of the genus Lopus, See answer to "Puzzled" in our number for October 3. $R.\ McL.$

INSECTS IN CUCUMBER-HOUSE; C. B. IV. Kindly send specimens of the insect which curls up like a woodlouse. Meanwhile, try the effect of carbolic acid, or of borax in powder strewn in their haunts, in driving the creatures out of the place. Baking the soil before making use of it would kill the larvæ and insects. Exposing to very strongly fermenting stable-dung in a close pit would have an almost equally good effect.

LILIES DISEASED: R. F. A bulb of Lilium Harrisi, sent in bad condition, although when potted six weeks ago it was all right. The scales at the tips, and in other parts, exhibit brown patches of rot; but in these we can distinguish no fungus mycelium. There are some minute cells, resembling bacteria, but not numerous, and it is an open question whether they have anything to do with the disease. R. F. complains that his bulbs went in the same manner last year. Very soon after exposure, the diseased spots are covered with a saprophytic mould. $M.\ C.\ C'.$

LYE: A. E. D. Wood-ashes mixed with water, allowed to stand for a time till it is clear, when it

Names of Fruits: Sherrington. Pear, Beurré Diel; Apple, Claygate Pearmain.—H. K. 1, Doyenné Boussoch(?); 2, Comte de Lamy; 3, King of the Pippins. E. Beck. Pear, Benré Bosc; Apples, 1, Col. Vaughan; 2.Rymer.—A. L. T. 26, King of the Pippins: 43, Fearn's Pippin; 40. Court of Wick; 47, Sturmer Pippin; 34 and 50, not recognized. cognised.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—S. P. 1, Pteris aquilina; 2, Solidago virga aurea (Golden Rod); 3, Polygonum

PHALENOPSIS: Garden. The injury may have hap pened to the Phalenopsis from the cause you describe, but it is more likely that it has been brought about by cold, or by being kept too wet and cold occasionally.

Scale on Holly: F. Fitzwater. The "scales" on Holly are a species of Aspidiotus, probably new to this country; the hedge is very badly attacked, and it is singular it had not been previously noticed. Timo will determine whether your application of petroleum has been beneficial. It is very difficult to "get at" scale insects, because the scale often protects the young brood underneath it. A very simple "wash" has been recommended, viz.:—2 lb. of hard lanndry soap to the gallon of water: it is worth trying. R. McL.

THE RECIPE FOR CANKER IN FRUIT: J. M., Cornwall-We will ascertain if it be one, the use of which is recommended by the nurseryman named.

TOMATOS IN ILL-HEALTH: V. S. We find no trace of fungus disease in the Tomatos sent. The pe-culiar condition of the fruits is the same as we have observed in two or three consignments to us for report, and from the fruits themselves we are unable to say anything. We are disposed to attribute the wrong to some external circumstances, or to climatic conditions, to which the fruits themselves furnish no clue. M. C. C.

VARIETIES OF DIFFERENT KINDS OF HARDY FRUITS: J. M., Cornwall. Not a very good one as regards Gooseberries, Strawberries, and dessert Pears and Apples. It should always be remembered that the best varieties fetch the highest prices, and they are generally as productive as inferior ones, therefore to be recommended for market purposes and cottager's cultivation. The kitchen varieties of Apples consist largely of early varieties.

WHITE CACTUS: S. T. We do not know exactly what plant you mean, but no Caetus fruit is poisonous; and some, like the Opuntia, are used in places as dessert fruits.

AND SIMPENCE FOR EVERY ADDITIONAL LINE. If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

Advertisements guaranteed to appear on the front page are charged at the rate of 1s. per line, head line counting as two lines. No display is allowed.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position .- Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances
Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertlsers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. Cove, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from neyotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisoments. 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; Airgdom, 12 months, 158., 0 months, 18. 0a., 3 months, 38. 9d. All Foreign Subscriptions, including Postage, 178. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.

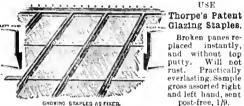

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with mplaint).

MD SIXPENCE FOR EVERY ADDITIONAL LINE. If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

Advertisements guaranteed to appear on the front page are charged at the rate of 1s. per line, head line counting as two lines. No display is allowed.

PARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertise-ments must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

Notice to Advertisers.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

Postal Orders.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. Cove, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.

Subscribers who experience any difficulty in the taining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by past, the cover should be forwarded with complaint.)

The Success achieved by Exhibitors at past and present Chrysanthemum Shows, notably Aquarium, Nov. 3, 1896, has elearly demonstrated,

by examples staged, that the

are of the greatest importance to those who wish to have fine blooms and superior fruit.

Registered Trade Mark.

XL ALL LIQUID MANURE.

There's something in it which cannot be obtained in a Dry Manure.

To be used one part to fifty of water, making the cheapest Plant Food in the market. Read the remarks below of a Champion Grower.

CHRYSANTHEMUMS.

OUR YEARLY INCREASE in the sale of hoth Plants and Cuttings arises certainly from the fact that all varieties (1400) are planted out and grown in open pure country fields, cut down early, not allowed to flower, large clumps removed, and replanted near the glass and light. Stock from these are perfect, and the secret why all those we supply carry success wherever they go, striking easily, growing quickly, and producing larger flowers. As a proof, they have made Mr. Mease the Champion of the Champions.

We cordially invite all to

Gardeners' Chronicle.

SATURDAY, NOVEMBER 21, 1896.

THE RECESS COMMITTEE AND FORESTRY.

THE report of Mr. Plunkett's Recess Committee on the advancement of agriculture and other industries in Ireland by the establishment of a special Board, is well worth perusal by those who regard the rural population of the country as something more than a "submergod tenth" which has fallen behind in its ideas and methods of living. A glance through its pages almost makes one ask, "Why should England wait?" for if the suggestions made are duly carried out, they would far exceed anything which is being done or attempted in Great Britain. But the special feature of the report which interests us more particularly is the view taken by the Committee upon the ferestry question. That they fully realize the importance and true significance of forests in national economy is shown by the following passage: "No one can enquire with any thoroughness into the subject of forestry without being convinced that this is one of the most important of all tho directions in which, with the aid of the State, the wealth of Ireland may be increased."

This is a truth which ought to be instilled into the public mind not only in Ireland, but throughout the British Empire. In the most recently published trade statistics it appears that the value of the timber and wood-pulp imported during ten months of 1896 exceeded that of the corresponding period of 1895 by 31 millions, and this with a somewhat similar number of acres of comparatively waste land, and select committees on the unemployed! In reviewing the forestry question the Committee chiefly confine themselves to quotations and extracts from the report of M. Howitz, a Danish forestry expert who gave evidence before the Eardly-Wilmot Committee of 1886. In addition to being a little out of date, this report is also a little imaginative. For instance, M. Howitz "calculated" that some 3,000,000 of acres might be planted, prepared, and fenced, at a cost of £3 to £6 per acre, and that the modest sum of £20,000,000 would do more than eover the outlay on planting 4,000,000 acres. This is credible enough, but the free use of eiphers looks a little suspicious of somewhat easy-going ealculations. But it is when he comes to the expected returns that M. Howitz seems possessed of a highly optimistic temperament. Remunerative thinnings six years after planting, and full returns in twentyfive years' time sound well; but one would like to see the data from which these computations were made. In the State forests of Prussia, nett yields of 20%, per acre are exceptional, yet M. Howitz puts this yield as the lowest that may be expected; and on the strength of this estimate the Committee show a profit of £3,000,000 per

annum on the same number of acres planted. At this rate, forestry in Ireland ought to attract the attention of company-promoters and capitalists. It is rather unfortunate that the opinion of men acquainted with the state of the timber trade, and the demand for home-grown wood in Ireland, was not obtained by the Committee, for information derived from such sources is usually of a more prosaic nature than that of enthusiasts. With every care, and in possession of all possible information, the estimation of the yield from timber crops to be cut in fifty to a hundred years' time is quite unreliable, for it is impossible to predict the price of timber in general or of that of a particular species so far in advance.

In sketching the work to be taken in hand by the suggested forestry bureau, the committee say, "The great work of re-afforesting Ireland, the possibilities of which are indicated in Part II., might be brought to nought for our time if it were botched at the start through being ontrusted to inferior and unskilful hands. A very recent warning on this point is furnished by the experience of the Congested Districts Board, whose later reports contain a confession of several failures in its forestry operations as a result of ignorance of this extremely technical business. bound to state our conviction that it will be necessary to go to the Continent for an expert capable of undertaking this branch of the new department's work" The Woods and Forests Department of India might be expected to furnish the requisite man-and we do not say that it would not; but Indian experience, being acquired amid a tropical vegetation, does not seem available for forestry work in our

When we consider that any intelligent fabourer who understands the planting of cabbages, is equally competent to planta forest, and that forestplanting is usually considered to be the branch of forestry in which the bond fide British forester least needs instruction, we cannot but come to the conclusion that the Congested Districts Board, whose forestry operations have been entirely confined to planting work, has either been unfortunate in its choice of men, or that the failure must be attributable to other causes than the one suggested. the old proverb, that "Too many cooks spoil the broth," may find application here. The committee is also in error in supposing that the question of climate affects the principles of forest science in any way. That an Indiau forest officer first entering upon his duties in this country would have a good deal to tearn regarding the peculiarities of the local climate and its effect upon sylvicultural methods, goes without saying; but an expert from the continent of Europe would probably be at an equal disadvantage as compared with one who had had several years' experience in the locality. The duties of the expert suggested would be rather of an administrative nature than relating to the actual sylvicultural operations of the forest, and it seems more reasonable to suppose that a native of this country would grasp the political and social side of his position more readily than a foreigner. Not only this, but the question of grazing-rights, and its successful settlement, which the Committee recognise as a necessary preliminary to afforestation, will depend in a great measure upon the tact, judgment, and due appreciation of the native character shown by this official, and a foreigner would obviously be at a great disadvantage regarding these points for a considerable period

after taking office. If Cooper's Hill has not turned out a man competent to fill this post within the last few years, something is wrong somewhere.

Whether the scheme mapped out by the Committee will ever be carried out in earnest remains to be seen, but the fact that they give it a prominent place in their report is an encouraging sign. So far, any afforestation-work undertaken by public departments of the State in this country has been made little more than an excuse for leaving the great bulk of the work undone. State-work ought to set a good example to the individual, and not merely consist of the maximum expenditure of money with the minimum of results. Let us hope that, if genuine State forestry is established in Ireland, the principle may also be extended to England, Scotland, and Wales, whose need, if less urgent, is almost as great.

NEW OR NOTEWORTHY PLANTS.

ANSELLIA CONFUSA, N. E. Br.

This is one of the most beautiful of all the Ansellias, and one in which the botanical features for regarding it as a species, apart from its greater floral beauty. It bears an ascending, branched, manyflowered inflorescence, each flower measuring 2 inches across. The sepals and petals are ovate, and equal in colour, which is cream-white barred with purple. The three-lobed labellum has purple-coloured stripes on the white interior of the side-lobes. The two keels running from the base of the lip are strongly defined, and give the best test for the species. These keels are of a bright-yellow colour, and the anteriorlobe of the lip is also yellow; the column is white freekled with purple. A plant is now in flower in the collection of rare Orchids belonging to the Hon. Walter Rothschild at Tring Park, Tring. J. O'R.

AMERICAN SEEDS.

In reference to an article which appeared recently in these columns, showing that our colonies derived their seeds largely from the United States, Messrs. D. Landreth & Sons, communicate a long letter to the Florists' Exchange, from which we extract the following details. If our home climate is not suitable for ripening all seeds, it is certain that many of our colonies could perfectly well raise their own crops. The Americans with their high protective notions would, of course, admit that the "colonists would be right" to do so. "We were once colonists onrselves, and we were right." Let us hope that a sense of our reciprocal dependence will make it right all round.

It might be asked, Why does not this firm increase the proportions of its importations? To which we reply, that it is our business to grow American seeds, and because we believe in American seeds and American everything else.

believe in American seeds and American everything else.

The seed frams owned in fee simple by this firm are: Bloomselde, 500 acres; Reedland, 146 acres; Monaskon, 222 acres. Granville, 472 acres. And rented from the estate of David Lambreth. Georges, 78 acres; Hunton's, 185 acres; Bellemont, 200 acres. On these particular farms, in summer, is employed a force of 200 brods, and in harvestring the force is mercased to 150 hands. Here is a total of 1803 acres, and not a bushel or a pound of anything sold off these lands except garden seeds; all agricultural seed, hay, corn, and feeding starts hought from neighbouring farmers.

It is true, seeds produced upon these farms cost us more than we can purchase them for from London hauses, but they are dryer and consequently of better vitality, and, more than that, they keep their vitality; for they show a higher percentage when two years old than the European seeds do at one year. For English seeds are not only frequently defective immediately after harvest, but during the occan voyage to America suffer a further loss of ten to twelve points in vitality.

The London correspondent of the Chronicle admits Americans can grow Pumpkin seed, but says all their Beet, Calbage, Celery, Cartot, Spinach, Radish, Tumip, Lettuce, Onico, Maugel, Conlifiower, and Swede, is obtained from Europe. He does not know that every one of these except the last three are grown profitably in the United States, and in large quantity, as for example, about 1,000,000 pounds of Onion seed is annually grown in the United States. We de not know how much Lettuce and Carrot, hut immense quantities, as well as large quantities of Turnip, Cabbage, Beet, Celery, Radish, and Spinach.

The American crops of Pers, Beans, and sugar-corn are immense, and while the Canadian preduct referred to by the Chronicle correspondent amounts possibly to half a million bushels annually, garden sorts and Marrow Fats combined, it is surpassed by the product of garden Peas alone raised in the two States of Michigan and Wisconsin. And yet we would ask if the Chronicle correspondent takes the ground that these Peas grown in Canada are not American.

Perhaps the correspondent of the *Chronicle* fails to realise that we have a wide range of climates and soils in the United States—climates as variable as those from Denmark to Algeria, England to southern Russia. Why should we not grow seeds

An Englishman familiar with the large products in Europe of Mangel, Sugar-beet, and Swede, and comparing those vast quantities with the infinitesimal quantities grown in the United States, might jump at the conclusion that this is not a seed-growing country; but that would be a misapprehension on his part, for America more than balances that account by an enormous product of teeds of Water Melon, Cantaloupe, Cucumber, Tomato, Squash, Pumpkin, Eggplant, Peas, Bush Beans, Lima Beans, and other pole Beans—very small quantities of which are grown in Europe.

If the correspondent of the Chronicle will turn to the United States Census Report, 1880, he will read that there are in the United States 596 seed-farms (evidently an incomplete return) with a total of 169,951 acres, 96,500 acres of which are devoted exclusively to the growing of vegetable and flower-seeds; while one million bushels of selected grains of corn, Wheat, and Oats for seed are grown on other farms not included in this commercation.

The report shows that of the 596 seed-farms, 258 are in the North Atlantic division, 157 in the North Central division, 89 in the South Atlantic division, 57 in the South Central division, 35 in the Western division: total, 596.

The value of the implements used in the culture of the seed crops of these farms is over 221,000 dols. The value of the farms, buildings, and implements, is stated to be over 18,000,000 dols. Quite 90 per cent, of these farms have come into existence since 1860, but the seed farmers, excepting the almost innumerable number of those who grow Vine-crops, and Peas, Beans, and corn, are now much depressed by competition from England, France, and Germany, for in those countries seeds not of somi-tropical habit can be produced at least cost because of larger yields per acre, due to greater moisture, and because of cheaper labour. These two conditions unfavourable to the American seed grower are aggravated by the reduction of the tariff to 10 per cent. The duty to be protective should be 40 per cent., and it looks as if that happy day was not far distant. At present it is impossible, so far as the growing price goes, to compete with Europe on parallel lines in the production of Cabbage, Turnip, Beet, Carrot, Radish, and a long list of other seeds: yet this firm still keeps at it because American seeds are wanted, and wanted badly.

Through colonial days, so far as is recorded, all seeds for the field and garden were imported from Europe, there being no traditions of any seed-merchants in the Colonies till after the revolutionary war. The first seed-merchants in America established themselves in Philadelphia, one in 1784, another about 1792, and another about 1794, and a fourth in 1801. The first still continues in business, the others only transacted business for a few years.

The fifth seed firm in antiquity of foundation was established in 1802 in New York, and still continues, soon to reach the age of 100 years. D. Landreth & Sons, Philadelphia, Pa, Seed Farmers and Merchants since 1784. (The Florists' Exchange, Oct. 24, 1896.)

NYMPHEA CHROMATELLA.

This, another of M. Marliac-Latour's cross-bred hardy Water Lilies (see ante, p. 558), the leaves are of a brownish olive-green colour blotched with dark purple, and the flowers, which are of large size, are pale sulphur-yellow in the centre, becoming yet paler towards the circumference. Our illustration (fig. 107) was taken from a specimen grown by Mr. Hudson in the open air in a small lake at Gunnersbury.

FOREIGN CORRESPONDENCE.

UNITED STATES.

I HAVE read the notes of "A. M. O." and others in the Gardeners' Chroniele on Maize or Indian-corn, and think I can give your readers some facts in the case that will enable them to grow corn that will mature, possibly not ripen enough to keep for another year's seed, but certainly ripe enough to cat and to be enjoyed as "green corn," or "roasting ears," as we call it here.

Now, there is corn and corn, just as there are Apples and Apples in your country; that is, there are hundreds of varieties of corn here, just as there

as "sweet corn," and of this there are many varieties that vary in colour, size, sweetness, size and length of cob, carliness of maturity, &c. As a rule, the white varieties are preferable for table use, and as a rule are sweeter and of better flavour than the yollow kinds; still, we have a black and a red variety that are sweet and much liked by many, although their

coarser and not so sweet as what are known as "sweet corn."

For field culture in the more northerly States and in New England, those having short and small cobs, and only eight or twelve rows of kernels on the cob, are grown, as the season of freedom from frost is short, and hence we aim to get kinds that mature in

Fig. 107, -- Nymphæa chromatella: hardy water-lily. Flowers pale primfose-coloured. (see p. 620.)

are hundreds of varieties of Apples with you, and of these hundreds of varieties but very few are ever used for cooking as "green corn" or as "roasting ears." The great majority of these varieties are of the classes known as "field corn," and are grown and used for food for animals, or for starch and alcohol-making, and not at all for table use. The corn that is used for table use is known

colour is not attractive for table use. En parenthèse, I might say that the corn we use for grinding into "corn-meal" is not derived from the varieties generally used for eating as "green corn," but is obtained from field varieties. In the Eastern States, yellow corn-meal is generally used, while in the West and South, white meal alone is supposed to be fit for the human stomach! The field varieties are

about four months from the planting of the seed to its thorough ripening. In the west and south, larger kinds are grown, and are generally of the class known as "Dent," or "Horse-tooth," from the size and shape of the kernels. The plant of this corn grows to a height of from 10 to even 15 or 18 feet; while that grown in the north eldom exceeds 5 or 6 feet in height. Most of the varieties of sweet corn are

quite short, and much of it very dwarf, often when fully grown not exceeding 3 feet in height. In your climate none but the dwarf kinds of the sweet corn should be grown, and of these I feel sure there are several that would mature fit for table, as up to if not above the north limits of England. It grows well and matures in Vermont, New Hampshire, Maine, Minnesota, Oregon, and States along our northern frontier. Of the sweet corn the following are the earliest and dwarfest:—

Cory Early: this is the earliest, height about 3 feet. White Cob Cory: this is very early, and about 3 feet high. Early Minnesota: is early, but of poor flavour. Extra Early Adams: early and good, cob about 6 inches long. Crosby's Early: early and excellent, dwarf. Perry's Hybrid: cob about 6 inches long, flavour good. Rosyln's Early Hybrid: is early and good. Moore's Early: one of the best, but not earliest. Henderson: very good, medium season kind. Ne Plns Ultra: Late, but very good. Squantum: extra good, but too late except for southern and western counties of your country. Stowell's Evergreen: A most excellent late variety; it has the peculiarity of remaining fit for table-use longer than any other variety I am acquainted with. This would be a good kind for your warmest and most sheltered valleys. From what I have seen and heard, you do not, as a rule, pluck your ears when they are fit for use-you pluck too early, and while the kernel is watery; you should not pluck the cob until the kernel is "in the milk," that is not until the fluid in the grain has passed from mere water to a rich thick milky fluid. But you must not go to the other extreme, and not pick till the grain is "glazed," for then it is not fit for table-use. It is in the prime when the fluid contents are thick and white, like rich milk. I also fancy you do not cook it properly. If left in the water in which it is boiled after it is cooked, it becomes watery and "soppy," and is not fit to eat. It should be cooked as one would boil an egg, namely, until the fluid is thoroughly coagulated, and that is about all. Our rule is to have the water at full boiling-heat, then drop into it the properly-stripped ear, and let it hoil only from five to ten minutes, and then you will have a "dish fit for a king." As to eating the corn off the cob, anyone with good teeth can bite it off, but those who do not wish to eat it in that way can, with a sharp table-knife, cut it off the cob without getting any of the woody cob along with the grains. Then having flavoured it with a little salt and butter, and black pepper, if that is liked, you can eat it with a fork or spoon. If eaten off the cob the butter and salt should be put on the grains of corn. What we know as "roasting ears," is the corn fit for eating off the cob, but in preparing it for use it is roasted (toasted if you will), before a quick fire. This way of preparing it is generally followed where it is prepared outdoors, say by hunters and the like, and is the plan universally used in the south by the "darkies" when robbing the cornfields of the planters. If I were going to try to grow corn in England I should select two or three of the earliest kinds, and Stowell's Evergreen, and should grow in cold frames, planting the seed about 1 inch deep, say in March, and in May should transplant in to a nonshaded part of the ground, putting the plants at least 30 inches apart each way, and the Stowell plants 4 feet apart. Keep the soil around the plants well stirred, but not "hilling up" the plants at all. The soil should be fairly rich, but not too much so, or you will get stalks and foliage, but not ears. If the soil is very sandy or chalky, water should be given occasionally, but only when the blades begin to curl their edges. When water is given, it should be given in abundance, and then withheld until this curling is again noticed. The dwarfer varieties will mature ears lit for use in sixty days from transplanting. In warm sheltered valleys I have no doubt you can mature the plant from out-door planting. case you should plant the seed not more than an inch deep about May 20, and in four months I have no doubt you would have excellent corn fit to eat from the cob. Any of your seedsmen can procure from their correspondents in New York, Boston, or Philadelphia any of the dwarf, sweet corn I have named. Doctor, Chicago.

ORCHID NOTES AND GLEANINGS.

MORMODES BUCCINATOR.

THE extraordinary variability of this species is now demonstrated in the Hon. Walter Rothschild's remarkable collection at Tring Park, where no fewer than seven varieties of it, differing very widely in colour, are in flower. The typical M. buccinator has greenish sepals and petals, and whitish up-turned trumpet-shaped labellum, peculiar to all the forms of the species. M. buccinator flavida has brownish sepals and petals, and clear yellow lip. M. B. aurantiaca has greenish sepals and petals, with brown lines and rich orange lip, and M. B. lentiginosa, has Indianyellow flowers, mottled and spotted with chestnutbrown. Another variety has brown-striped sepals and petals, and blush-white lip; and others still differ from any of these. Other Mormodes in flower are M. Cognaiuxi, M. Rolfeana, M. ignea maculata, the singular hairy-lipped M. Lawrenceana; and another species, with very handsome, delightfully fragrant flowers, in which the sepals and petals are gamboge-yellow, spotted with chocolate, and the showy lip rose-pink, spotted with reddish-purple. It is allied to, or a fine variety of, M. tigrina, Rodrig. Varieties of M. pardina are also about to expand their flowers, and promise great variety in that species also.

Of allied plants the handsome Cycnoches maculatum, C. Egertonianum, and a large number of Catasetums are in flower. These plants are easily managed at Tring Park by Mr. E. Hill, growing them in a similar manner to the dociduous Dendrobiums, and suspended near the roof as much as possible. They are watered liberally while making growth, and until the stout fleshy pseudo-bulbs are completed and the leaves begin to turn yellow, after which water is almost entirely withheld until they grow again. J. O'R.

Cypripedium Charlesworthi.

There is a whole house, quite 60 feet long, filled with Cypripedium Charlesworthi in the Heaton Nurseries, Bradford. It presents at this time a remarkable sight, with quite 1000 flowers expanded. The variety of this species is greater even than most others of our acquaintance. The dorsal sepal varying from those fine lustrous vinous shadings and lines to a pale blush. The substance of some of the varieties is great, not only in the dorsal sepal, but in its petals and pouch, and as one of the intermediate race with a peduncle half and between niveum on the one hand, and the barbatum race on the other, it presents a stylish appearance. It is growing away with thousands of fellows with quite ordinary attention, and, but for its plentifulness, would be much more appreciated. J. A.

BURFORD, DORKING.

One of the many pleasures of inspecting the famous collection of Orchids in the gardens of Sir Trevor Lawrence, Bart., the President of the Royal Horticultural Society, is the extraordinary variety of the species it includes, and which ranges from the earliest specimens introduced to gardens, to the latest novelty, and those still undetermined, and which have yet to be named and described. Of the former class, the historical specimen of Renanthera coccinea is one of the earliest introductions of Asiatic epiphytal Orchids, and perhaps the oldest cultivated plant of the same class known. Many other examples in contradiction of the theory that Orchids must necessarily degenerate, and ultimately die under cultivation, are to be found at Eurford, and the earefully-labelled plants in many cases give ample proof of their being old inhabitants of the Burford Orchid-houses. For example, a few noted promiscuously were Odontoglossum aspersum violaceum, purchased fifteen years ago; O. crispum guttatum, now in flower fourteen years; O. Hallii, seventeen years; and the rare Zygopetalum Burkei, described in the Gardeners' Chronicle December 1, 1883, from plants which Burke collected for Messrs. James Veitch & Sons, the plant now about to flower at Burford being one of the first distributed.

In most of the houses, the showy species and the lesser pretty botanical kinds are evenly halanced, for here it is the practice to put the lesser in stature wherever they may be found to thrive best, instead of having houses set apart for them alone, and it is this provision for giving such various conditions under which they may be grown, which, in a great measure, accounts for so many tiny gems thriving here which have speedily vanished from other collections. In all cases, however, the small plants are brought near to the glass of the roof in the house which they are placed. In the first house entered we found a fine show of Cypripedium Charlesworthi, C. Spicerianum, and C. × Leeanum superbum, with a fine example of C. L. giganteum, and other forms of the same showy hybrid, the greater number of which were raised at Burford. Here, too, was a grand specimen of C. insigne violaceo-punctatum, which is still one of the finest of its class; also the fine C. i. Dormanianum, and the matchless yellow and white C. i. Sanderæ; a panful of the pretty C. Schlini, the plant well furnished with flowers; the showy C. x radiosum (Lawrenceanum × Spicerianum), a number of neat plants of the yellow Oncidium cheirophorum, and of the mauve O. ornithorhynchum; the singular and pretty Epidendrum Lancheanum, with a raceme of flowers very distinct from those of other species; the new Trichocentrum longicalcaratum, with white flowers with crimson blotch, and in which the spur is singularly elongated; and a graceful specimen of Platyclinis Cobbiana.

In the next liouse, a cool one, are some fine examples of Oncidium varicosum, O. spilopterum (generally known as O. Saintlegerianum), some few species of Odontoglossums in bloom, and also Cœlogyne ocellata, Epidendrum inversum, Oncidium O'Brienianum (Reich. f.), a Paraguay species of the O. pubes class; and Seraphyta multiflora, a Mexican species, recently shown as Epidendrum profusum—it is of the habit of the slender-stemmed Epidendrums, and bears a branched inflorescence of greenish-coloured flowers.

The intermediate-house which comes next, had in flower some plants of Cattleya labiata, with richly-coloured flowers; the pretty Lælia pumila; some of Cattleya Dormaniana, C. O'Brieniana; the handsome and still rare Trichopilia brevis, illustrated in the Gardeners' Chronicle, Nov. 30, 1895, p. 641; a batch of the pretty Vanda Kimballiana, and two of the finest specimens of Vanda Amesiana ever seen in gardens, one possessing eleven pairs of leaves, and three very robust spikes of flowers. These wonderful plants were acquired by Sir Trevor Lawrence from Messrs. Otto Froebel of Zurich, when last he visited Switzerland.

In the large warm-house, which has a water-tank in the middle, were noted remarkable collections of Catasetums, some Cycnoches, Bulbophyllum, and Cirrhopetalum, which are suspended from the roof, and all thrive equally well in spite of the fact that they naturally inhabit widely separated countries with different climates. All of the Catasetnms hang on one side of the house, and that part of it nearest to the side staging, thus having the width of the walk between them and the tank. Glancing along them, wo noticed how remarkably the air-roots sent out around and beneath the baskets and pans in which the plants were grown, all turned obliquely and directly towards the tank, the thousands of roots all pointing in one direction, giving the appearance seen in the slender branches of trees over which a gale of wind is blowing. The Catasetums and allied plants are grown like the deciduous Dendrobes, and rested after the leaves have fallen; and this seems to be the chief thing necessary to preserve these singular plants, which formerly used to be considered very difficult to keep in good health. Of those in flower, we remarked splendid forms of Catasetum Bungerothi, one having purple sepals and petals; some equally handsome C. x splendens, the showiest having flowers of rich orange with purple spots on the sepals and petals; C. Christyanum, C. purum, and others; and C. imperiale, the richest purple Catasetum, is also sending up a spike. Of the Cirrhopetalums

the oldest inhabitant is a pan filled with C. Cumingi, about 2 feet across, and which with its numerous rosy-red umbels of delicately-poised flowers forms a a charming object. Cirrhopetalum Mastersii, with heads of beautiful coppery-yellow coloured flowers, and a few others, are also in bloom. Besides these were Bulbophyllum Dearei, B. Careyanum, the singular small-growing Madagascan B. Pervillei, and Trias disciflora were in flower. In this same house, and placed above the tank, species of Phalænopsis are doing well, including P. antennifera in many varieties, and a few others which were in bloom. Here also a supposed new white Schomburgkia was sending up a flower-spike, and S. rhionodora var. Kimballiana was about to produce its handsome blooms. Among other Orchids in flower were Dendrobium sanguinoleutum, D. glomeratum, D. x rhodopterygium, D. macrophyllum, Lælia peduncularis with many spikes, Cattleya Iuteola, and just beginning to flower a grand array of the Burford hybrid Calanthes, some of which have dark, rich colours, and all have some distinguishing feature to render them desirable. Here, too, were some good pansful of Ancectochili, the A. (Macodes) petola growing and increasing rapidly.

One small house held a charming display of the varieties of Dendrobium Phalonopsis Schroderianum, no two of which are alike, though all are beautiful. and especially the white varieties with the delicate rose-tinted segments. In this house were numbers of Eulophias and Lissochilus, those of the former in bloom being E. virens, a rather pretty and graceful species. In the adjoining house many curious species were in flower, one of them, Polystachya Buchanani. reminding us of John Buchanan, the sturdy pioneer of the Upper Zambezi, who sent it and other interesting plants from that part of Africa, but who died on his way home on the 9th of March last. Here in flower were Liparis reflexa, Acampe papillosa, Angreeum bilobum, and other Angreeums; and suspended in a corner was a very remarkable Dichæa sp., which might be said to be a disappointing plant, for it looks as though it were dead, but it is healthy enough, and flowering with faded-looking flowers. the seeming decay being natural and peculiar to the plant. Other pretty things in bloom were the richlycoloured Epidendrum phonicum, an old but very handsome species, Dendrobium Mooreanum, and other Deadrobiums.

In the large stove the giant Grammatophyllum speciosum is growing with vigour, but it does not flower; Vanda Hookeriana, which formerly gave some trouble, has reached to the roof, and still has leaves down to the pot; so also its charming hybrid, V. x Miss Joaquim, which it is hoped will soon flower. In this house lately one of the plants of Vanilla had over sixty pods; and the charming collection of novelties in Bertolonia and Sonerila have leaves as handsome in their way as the showiest flowers. In the larger Cattleya-house stands the gigantic plant of Cattleya Lawrenceana, of which we recently gave an illustration, and it is none the worse for its heavy crop of flowers. Here was remarked a fine batch of Pleiones in flower, consisting chiefly of masses of P. lagenaria, P. maculata, and lesser plants of the white P. maculata alba. These Pleiones Mr. W. H. White, the Orchid grower at Burford, remarks, are never divided after the manner advocated by some, but they are, when repotted, merely turned out, reduced in size, and as long as practicable, returned to the same comparatively small pots, and hence the profuseness with which they bloom. Cattleya . Harrisii, Ladio-Cattleya x Juvenilis, some grand Cattleya Bowringiana, including the purple-tinted C. B. lilacina, Lælia tenebrosa, and others, were in bloom; and it was noted that the many varieties of L. anceps were about to make a good show.

The Eurford hybrid Dendrobiums occupying one side of a house, are in grand condition, and some of them about to flower; and the little house devoted to the raising of hybrids, contains many strange crosses, and among the pretty things in bloom we noted Cypripedium × concolawre, C. × Lawrebel, and

C. barbatum Warneri bellatulum, one of the brightest rose-purple flowers of its class.

A spleudid collection of Sobralias, consisting of all obtainable species and varieties, was observed. In the cool-houses in flower were Maxillaria lepidota, a graceful species, with hundreds of its long, narrow-petalled flowers; fine plants of M. grandiflora, M. picta, Miltonia candida grandiflora, M. Clowesii, Epidendrum vitellinum majus, Masdevallia tovarensis, M. leontoglossa, M. macrura, and other Masdevallias; and Pleurothallis. In a warm-house a batch of Habenaria militaris was still flowering, and also one or two H. carnea. These charming plants were supposed to be almost unmanageable until Mr. White worked out the problem at Burford, and now they are being well grown in many gardens. J. O.E.

POLLINATION OF PEAR-FLOWERS

ALL over the country there are large healthy Peartrees which blossom most beautifully every year, but it is not followed by any fruit. The owner will do well to try planting Pears of another variety in their neighbourhood, so that the pollen of the flowers of the new conners may find it; way to the flowers of the new conners may find it; way to the flowers of the new barren trees.

An exhaustive inquiry, conducted by Merton B. Waite, under the direction of B. T. Galloway, just published as Bulletin No. 5. Division of Vegetable Pathology, United States Department of Agriculture, reaches the following general summary and conclusions:—

"In the pollination work on the Pear two distinct kinds of experiments have been tried-1, simple bagging experiments, in which bags of paper, cheesecloth, or netting with meshes (ten to the inch) were placed over the unopened buds, and outside pollen thus excluded; 2, careful hand pollinations of flowers which were emasculated while yet in bud, and protected from all other pollen by paper bags. These experiments were carried on in large numbers, and at four different places-at Brockport in 1891, and at Scotland, Rochester, and Geneva in 1892-all in New York State. The conditions of the trees were widely different, as was also the weather at flowering-time. The work was done on a large number of varieties of Pears, several of the same varieties occurring in each of the four series of experiments. The results under these varying conditions have substantially agreed, in most cases being remarkably uniform. The fruits resulting from the different kinds of pollen showed interesting differences, which tend to corroborate the

"It should also be noted that similar experiments were tried on the Apple and the Quince, along with the Pear work. The varieties of Apples are more inclined to be sterile to their own pollen than the Pears. With the former, in the great majority of cases, no fruit resulted from self-pollination. The results, as a rule, however, were less clear-cut than in the Pear, because with most of the self-sterile varieties an occasional fruit will set under self-pollination, and none of the varieties were very completely selffertile. The Quince, on the other hand, seems to fruit nearly as well with its own pollen as with that of another variety. The following conclusions are, it is thought, fully warranted from the evidence which has been given, and doubtless many who read this will recall observations in practical orcharding which give further support :-

"1. Many of the common varieties of Pears require cross pollination, being partially or wholly incapable of setting fruit when limited to their own pollen.

"2. Some varieties are capable of self-fertilisation.

"3. Cross-pollination is not accomplished by applying pollen from another tree of the same grafted variety, but is secured by using pollen from a tree of a distinct horticultural variety—that is, which has grown from a distinct seed. Pollen from another tree

grown from a distinct seed. Pollen from another tree of the same variety is no better than from the same tree. This failure to fruit is due to sterility of the pollen, and not mechanical causes.

"4. The impotency of the pollen is not due to any deficiency of its own, but to the lack of affinity

between the pollen and the ovules of the same variety.

"5. The pollen of two varieties may be absolutely self-sterile, and at the same time perfectly crossfertile.

"6. The state of nutrition of the tree and its general environment affects its ability to set fruit either with its own pollen or that of another tree.

"7. Bees and other insects are the agents for the transportation of pollen.

"8. Bad weather during flowering-time has a decidedy injurious influence on fruitage by keeping away insect visitors, and also by affecting the fecundation of the flowers; conversely, fine weather favours cross-pollination and the setting of fruit.

"9. Pears produced by self-fertilisation are very uniform in shape. They differ from crosses not only in size and shape, but also in some cases in time of maturity and in flavour.

"10. Among the crosses the differences were slight or variable, so that their variations are not to be ascribed with certainty to differences in pollen.

"11. Self-fecundated Pears are deficient in seeds, usually having only abortive ones, while the crosses are well supplied with sound seeds.

"12 Even with those varieties which are capable of self-fecundation, the pollen of another variety is prepotent, and unless the entrance of foreign pollen be prevented, the greater number of fruits will be affected by it, as shown by the study of Buffum Pears.

"13. The normal typical fruits, and in most cases the largest and finest specimens, either of the selfsterile or self-fertile sorts, are crosses.

" PRACTICAL CONCLUSIONS.

"1. Plant mixed orchards, or at least avoid planting solid blocks of one variety. It is not desirable to have more than three or four rows of one variety together, unless experience has shown it to be perfectly self-fertile.

"2. Where large blocks of trees of one variety which blossomed well have failed to fruit for a series of years without any apparent reason, it is exceedingly probable that the failure is due to lack of cross-pollination. The remedy is to graft in other varieties and supply foreign pollen.

"3 De sure that there are sufficient bees in the neighbourhood, or within 2 or 3 miles, to properly visit the blossoms. When feasible, endeavour to favour insect visits to the blossoms by selecting sheltered situations, or by planting windbreaks."

American Agricultur.st.

THE ROSARY.

SOME NEW VARIETIES OF THE ROSE.

Among the finest varieties of recent introduction are Enchantress, Queen Mab, Sylph, and Zephyr, natives of Waltham Cross; Muriel Grahame and Helen Keller, the former introduced, and the latter originated by Messrs. Alexander Dickson & Sons, of Newtownards; Fiametta Nabonnand, for which we are indebted to the eminent French rosarian bearing the latter portion of that name: Carnine Pillar, which we owe to Mr. George Paul, of Cheshunt, who has rarely given us a more brilliant variety, or one more serviceable for garden decoration; and Duchess of York, of exquisite complexion, raised by Messrs. Cocker, of Aberdeen.

Enchantress, which I had the pleasure of seeing for the first time at Waltham Cross last year, is, I understand, a cross between a China and a Tea. Hence, probably, its almost unprecedented perpetuality and free-flowering qualifications. It is a beautiful creamywhite Rose, with a suggestion of buff in the centre. It is large, full, and globular in form, with glossygreen foliage, which forms a graceful contrast to the fascinating flowers, the latter of which are produced in great profusion.

Queen Mab, which is of Chinese extraction, is undoubtedly the most distinctive variety of this special class that has been produced since Laurette Messimy. It is vigorous in growth, and, unlike the French Rose

to which I have just alluded, has flowers of great substance; it blooms with much facility. Its colour is delicate apricot, shaded in the centre with orange, the exterior petals being faintly flushed with rose. Mrs. W. J. Grant (called in America Belle Siebrecht), and Grand Duke de Luxembourg, the former raised by the Newtownards firm, the latter by Soupert & Notting, in 1892, are highly interesting additions to the race of Hybrid Teas. Mrs. W. J. Grant, which gained some years ago the Gold Medal of the National Rose Society, I have already described in a previous contribution to the Gardeners' Chronicle. It combines the attributes of Lady Mary Fitz-William with those of the fragrant and distinctive La France. Modern pink-coloured Roses are for the most part somewhat deficient in the matter of fragrance; but this is an exception. I am not yet sufficiently acquainted with the character and tendencies of the new hybrid perpetual entitled Helen Keller, to pronounce a decisive opinion upon its value; but it appears to be a very promising variety, though I cannot believe that it will ever rival Marchioness of Downshire, Earl of Dufferin, or Mrs. Sharman Crawford. Sylph and Zephyr are admirable Roses for the garden, with large full flowers almost white in colour, of highly refined aspect; but by reason of the peculiar silkiness of their closely folded petals, exceedingly susceptible, like Mrs. James Wilson, to the influence of rain. Muriel Grahame, described as a valuable variation from that prolific parent of modern Tea Roses-Catherine Mermet; but I hope, ere long, to have this gratification, for I intend to add it next month to my collection. It opens, I am glad to learn, with greater facility than the fairest of its sisters, the incomparable Bride.

Fiametta Nabonnand, whose name, I find, is seldom printed accurately, by reason, presumably, of its unfamiliarity, has bloomed with great freedom and to to some artistic purpose, in my garden this year. It is a sport from Papa Gontier, one of the most attractive of modern Tea Roses, but is considerably larger and fuller than its parent, though somewhat less productive. Its colour is fascinating; satiny-white, delicately tinted with rose. Only in the texture of its beautiful petals does it give evidence of the influence of the law of heredity. Its flowers are invariably of a globular form; in this respect they somewhat resemble those of Souvenir de S. A. Prince, but they have not the regrettable pendulous tendency of that snow-white English Rose.

A yellow Hybrid Perpetual of considerably deeper colour than Gloire Lyonnaise would be a great acquisition; but a variety of this character has not yet appeared. Nor has a pure white Mario Banmann or A. K. Williams, with the perfection of form and fascination of fragrance possessed by those varieties, as yet proved a possibility to our British rosarians. Nor, though we have achieved a Madame Hoste, a Medea, and a Perle des Jardins, does there seem to be any hope of our ultimately obtaining a less delicately constituted, more perpetual, Maréchal Niel. David R. Il illiamson.

TREES AND SHRUBS.

HYPERICUM MOSERIANUM VARIETY TRICOLOR.

This variegated variety of II. Moserianum is a very meritorious novelty. Its leaves are beautifully edged and marbled with white and brilliant red. Presently with me the white is absent, and the red and green leaves are very effective. To bring out the colouring of this little shrub to perfection, it requires to be grown in poor sandy soil with a sunny exposure. It is a decided acquisition; its golden-yellow flowers, with centre of darker coloured stamens, are sufficient to commend it for general cultivation—add to these its variegated character, and we have a plant deserving special attention. It is at home on the sunny side of a rockery, or the front of a herbaccous border. Michael Culhbertson, Rothesay.

CUPRESSUS GOVENIANA.

When seen in a flourishing condition, which, unfortunately, is not often the case in this country, Cupressus Goveniana is at once one of the most interesting and beautiful of the hardy, or rather halfhardy, Cypresses. I have just had an opportunity of examining probably the largest, certainly the healthiest, specimens of this tree in the country, and of comparing it with the not very widely distributed C. cornuta, which by some authors has been elevated to specific rank. The two are in every respect identical, the bright green, scale-like leaves and curious horn-like projections at the scale-tips being well pronounced in both. Like the Chinese Juniper, one of the greatest points of attraction in Cupressus Goveniana is the pollen-cones, they being so thickly produced as to impart to the specimen a very unusual and beautiful appearance. The seed-cones, too, are freely produced, and are of the most harmonising tints of dark and light brown, and rendered distinct from every other species by the curious projections at the scale-tips, each of these being half an inch long. To the casual observer, Cupressus Goveniana looks like a dwarfed, globose specimen of the better known C. macrocarpa; indeed, it is always bushy and dense of habit. The finest specimens of this and many other Cypresses that I have seen are throughout Ireland, both north and south; and one of C. Goveniana only thirty miles from Belfast is nearly 40 feet high, and fully half that in branch-spread. It occupies no sheltered situation, and yet the foliage is green as a Leek, and thickly and equally arranged on every side of the tree. The soil is moist loam.

C. Goveniana glauca is, for ornamental purposes,

C. Goveniana glauca is, for ornamental purposes, superior to the species, the hoary, glossy-blue foliagetint reminding one of that of the Tamarisk-foliaged Juniper. This pretty variety is rare in cultivation, but it should not remain so long if the batch of young plants that I saw are to be placed on the market.

A. D. Webster.

BOOK NOTICE.

DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES.*

It goes without saying, that a work projected, carried out, and edited by that elever authority on Orchids, Monsieur A. Cogniaux, and in which the drawings and coloured plates are the work of Monsieur A. Goossens, whose power of artistically figuring Orchids is known far and wide, must be of the highest merit. Indeed, all works of the kind are good and useful in a greater or lesser degree, publishers being careful not to incur the very heavy cost inseparable from the publishing of such works without certifying themselves that a reasonable accuracy characterises the letter-press, together with beauty and faithfulness in the plates.

In the work under notice a new element has been introduced, viz., the publication of the plates, each with the accompanying descriptions, references, cultural remarks, &c., in handy little portfolios, so that each plate and the matter relating to it is complete in itself; and the collection, when completed in the portfolios, each of which will be lettered on the back with the name of the genus contained in it, will give a readier means of studying Orchids, and identifying them, than has previously existed. The utility of this plan of giving detachable illustrations of Orchids might be much enlarged upon, but it will be sufficient to point out how useful and interesting such portable means of conveying a correct notion of what is meant, these plates will be to amateurs in their correspondence, and what a pleasant pastime it will be for them to compare their flowers with those given in the illustrations.

A commencement will be made of each set of plates with the type forms, which are to be followed by the leading known varieties, and also new forms as they appear. As for example, the Odontoglossums

Dictionnaire Iconographique des Orchidées. Directed and Edited by A. Cogniaux; Illustrated by A. Goossens. (Schaerbeek: Bruxelles, 24, Rue Quinaur.)

which are illustrated in the first issue (which was intended to be devoted entirely to that genus), had not unforeseen difficulties delayed some of the illustrations. No. 1 is typical Odontoglossum crispum; 1 a, 0. c. stellatum, which is the form usually avoided in gardens; 1 b, 0. c. var. de Madame Madoux, a finely spotted form; and 1 c, 0. c. var. Bousiesianum, which resembles that known to us as 0. c. punctatissimum. Necessarily at the commencement a strong continental character will be found in the varieties illustrated, but British amateurs doubtless have only to supply the material to see their own treasures also represented.

With the illustration of the type of each genus, the history, general characters, and geographical distribution are given, and engravings furnished showing the habit of the plant, and the pollinia, and other points necessary for purposes of identification. In fact, the style of the work has been well considered and matured. The plates, which measure about 7 inches by $5\frac{1}{2}$ inches, will be double when necessary, as in the case of Lælia purpurata in the present issue. The other plants illustrated are Miltonia vexillaria, M. v. superba, M. v. radiata, M. spectabilis, M. s. bicolor, M. s. Moreliana, and Cattleya Brymeriana. When we consider the large number of Orchids which have as yet not been figured, and those figured which are not of easy access, it is pleasant to contemplate the great addition which this work forms of materials for reference purposes. The plates are to follow each other rapidly, and we shall watch with interest the development of this novel publication.

CEYLON.

I AM sure you will sympathise with us in the great loss we have sustained in the death, from paralysis, of Henry Trimen. He was a beloved friend to those who were closely acquainted with him, as we have been during his residence of sixteen years in Ceylon. The scientific world has lost a most keen, true, and careful observer and investigator of natural history, not only in the one special study of botany, but also of many subjects which generally follow the footsteps of a man of culture and learning. He was of a most genial disposition, kind, and attentive to his subordinates, and very ready to assist the poor and needy. We may say he died with his pen in his hand, endeavouring to finish that valuable record of his labours, the Flora of Ccylon. It is some satisfaction to his friends to learn that it was almost completed at the day he was struck down. J. A.

THE HERBACEOUS BORDER.

PLANTING HERBACEOUS PHLOXES.

THOUGH hardy perennials, as a whole, are usually regarded as among those things that may be planted at almost any season, I am assured that this is a mistake with respect to many of them-that is, if they are planted with a view of securing good results. Many groups of species or individual plants are well suited for being planted in the autumn, and among the former may be mentioned the herhaceous Phloxes, which are included under the general head of P. decussata, in which are also included P. paniculata, P. pyramidalis, and others. These plants produce aunual stems, and do not remain evergreen, as do the forms of P. suffruticosa, a totally distinct group of early varieties, with foliage, in many instances, like some of the Pentstemons. These sub-shrubby kinds, however, are not so much grown as the herbaceous section, being generally more difficult to suit in the matter of soil and situation, while the P. decussata varieties are at home in almost every kind of soil. It is of these latter kinds that I now wish to speak. If planted at this season, they will be quite established before hard frosts usually begin. The chief requirements for these Phloxes is a deepish, very rich soil, and in these respects it is scarcely possible to err. Trench the soil 2 feet deep, incorporating pleuty of manure with it as the work proceeds.

It is not necessary to bury the manure deeply, as Phloxes are largely surface-feeders. Select a spot quite in the open, and if a damp spot can be found in the garden, this will suit the Phloxes. Avoid planting near to the shrnbs in shrnbheries, or where the roots of trees extend, or their branches overhaug. In planting, bury the crowns 2 inches below the

margins so as to keep in the water. When in flower, his plants formed a grand sight, and were well worth going many miles to see. Plants out of pots may be planted at varying seasons, but even these are better in their permanent positions as soon as possible, shaking all the soil from them prior to planting, so as to give them a fair start. J.

FIG. 108.—PERESKIA ACULEATA: FLOWERS CREAMY-WHITE.

surface, pressing or treading the soil firmly. Avoid the high-mounded bed, which throws off the water that the plants require, but give preference to the bed that is sunk below the surrounding level. The late Mr. R. Parker grew one of the finest collections of Phloxes at Tooting ever seen, and the plan he adopted with his beds of specimens was to flood the land twice or thrice a week, the beds being earthed up at the

CHRYSANTHEMUM CHAT.

(Continued from p 302)

THE EDINBURGH CHRYSANTHEMPM Show.—The verdict is that the flowers are late this season, and on the whole scarcely so fine as in some recent years. A somewhat doubtful statement.

The following are some of the finer blossoms or plants noted among some of the more netable

market growers around Edinburgh, and the champion growers of cut-blooms and plants in pots, such as Mr. Carruthers, Mr. Cavanagh, and others: Chas. Davis, Duchess of Wellington, Etoile de Lyon, Edith Tabor, a fine yellow; Mrs. Weeks, Van den Heede, President Borel, Phœbus, Mutual Friend, exquisite light rose; Mrs. E. G. Hall, Mrs. Bernard, M. Gruyer, Mrs. Godfrey, graphic, rose and white; Thos. Wilkins, Emily Silsbury, Baron Rothschild, W. Tucker, Hairy Wonder, Calvat's Australian Gold, Princess May, Avalanche, Col. W. Smith, Viviand Morel, Commandant Blussett, J. Shrimpton, Madame de Sevin, Bouquet de Dame, Madame Hoste, Mrs. Cox, L'Isère, Col. W. Smith, Niveus, Louis Bohmer, Mr. Shea, Madame Cambon, Mrs. C. E. Shea, Deuil de Jules Ferry.

THE NEWEST HARRY CHRYSANTHEMUMS,

Notwithstanding the acknowledged fact that Chrysanthemums, generally, have lost much of their nevelty and importance, the "hairy" varieties, the first of which, Mrs. Alpheus Hardy and Louis Bohmer, came from Japan, and are now well known, centinue to enjoy popularity. And just as, at the beginning of the present craze for novelty, the slightest difference in form, size, colour, suffices to constitute a new variety, this peculiar group has received additions of much merit in recent years. These novelties are M. d'Ambrière, rose-pink with stripes of a lighter shade, the central florets incurving, and this showing the brenze-coloured reverse furnished with golden-hued hairs; Raphael Collin, light pink with saffron coloured edge, the reverse of these florets saffron yellow with goblen hairs; Duvet Blanc, a very large flower with snowwhite florets covered with long white hairs; Mygall, a flower of pleasing form, the florets leather-yellow and old-rod, at the base crimson, the central florets green, and the hairs fawn-coloured; Madame Sekarek, under silvery-rose colonr, with large florets covered with numerous long hairs; Plume d'Or, a large cone-shaped flower, light-yellow in line, with the reverse of the florets thickly furnished with hairs, the best yellow of this race; Hairy Wonder, a flower of immense dimensions, heavily haired, is pretty well known in this country. Illustrictic tharten Zeitung.

PERESKIA ACULEATA.

For the opportunity of figuring flowers of this old inhabitant of our gardens, we are indebted to Mr. Eurbidge, the Curator of the Botanic Garden, Trinity College, Dublin. The plant is a true Cactus, but, like its fellow Pereskia Bleo, recently figured, it bears flat leaves. It grows under Mr. Burbidge's care in a warm stove, and is 15 feet and upwards in height, and produces its whitish flowers almost every year. It is commonly known as the Barbados Gooseberry, as in the West Indies the yellow fruits are eaten in the form of preserves (see fig. 198).

THE APIARY.

DAIRY SHOW,

At the show which has recently been held at the Agricultural Hall, there was an exceptionally fine lot of honey exhibited, both in sections and in run, and from the good quality shown from all parts of England, we may consider we have had a fairly good honey season. And there is at this show a meeting of the largest and best bee-keepers, who are always willing to give any information they can towards the further development of bee-keeping, and often to indicate (if not buyers themselves) where a customer for your produce may be found, as sometimes a surplus is left over where a good many hives of bees are kept. There is also a good opportunity of seeing and examining all new appliances, and obtaining a thorough insight into the use of them; and to beginners it is of special interest, as they can

decide as to which system it is best to adopt before commencing bee culture. Having decided which hive to adopt, commence having them made, or make them, during the winter months, to be ready for use in the spring. The hive I use and like best is the ordinary bar frame, but made on the tiering system. Be quite sure it is of the standard size with hollow walls, so that it can be packed with saw-dust or cork-dust, which prevents a good deal of frost from penetrating into the hives. The great advantage of the tiering system is, that you can place an empty crate of sections under the full one, which will not disturb the bees very much, and by placing a "super clearor" between the full and empty crate the sections can be taken away without any trouble or fear of stings.

SUPER-CRATES.

These should also be got ready in the winter months, as it is very awkward to find your bees ready for them where there is none to hand, which means loss of honey and swarms when they are not required.

PROTECTOR SKEPS.

A very simple plan is to get an ordinary cheese-box, cut out the bottom, and place over the skep, which can be covered with an old pan or slate, and then covered with sacks or cloths; another plan, and a good one too, is to get from a gunsmith a powder-tin, cut out the top, and place this over the skep—this can be painted.

REMOVING BEES.

Frosty weather is a good time to remove stock, because they do not notice the removal so much, as they are all song and warm in their winter quarters. Before removing, secure the entrance, and also screw down a piece of wood on each side of the frames to keep them from moving; or place a few bricks on them, which will often do as well, but alway. We sure to keep the hire upright.

EMERGENCY BOARS AND BAR FLAME,

I hope to give a description of these and their advantages in my next article.

GRAPE-VINES IN LONDON.

To the present generation of Londoners the sight of ripening Grapes on sunuy walls in and around the town, is of rarer occurrence than was the case when suburban residences were very necessarily protected against unlawful entry by high brick wall.

A red brick wall is all very well when it gets old, and its fiery colour toned down by souty deposits and moss, Linaria cymbalaria, Wall Rue, Wallflowers, and Snapdragons, and our forefathers very properly did their best by planting lvy, Jasmine, Roses, fruit trees and Vines to transfigure the fiery-looking horror into a thing of beauty. Some of these old walls exist in many of the suburbs, or what once were suburbs, but which are now incorporated with London proper. The varieties of Grape-vines planted were usually Miller's Burgundy, and varieties of Sweet water, whose fruits ripen in ordinary summers if the Vines are suitably pruned winter and summer, the shoots kept thinly disposed, and new fruiting shoots laid in yearly. Usually a wall Vine gets as little attention as regards its roots and shoots as an lvy plant, with the certain consequence of its fruits being poor in quality, and ill ripened; whereas, given the care bestowed on a Peach or Fig tree, the Vine would reward the cultivator as generously as those.

The writer has in his mind's eye a roomy house of great age, situated near the site of the prescut Imperial Institute, once doubtless the habitation of a wealthy citizen, and the tiled roof of which was almost covered with a Sweetwater Vinc. This Vine may have had at one period of its existence the benefit of suitable pruning, training, and manuring, but in the last years of its life it was utterly neglected; still it would in good years ripen off large quantities of delicious fruit. The main stem and branches rested on a stout framework of wood, which enabled the bunches to hang clear of the tiles.

Seeing the success of the Castle Coch vineyards at Cardiff, it is certain that out-of-doors Grape-culture, if properly followed up, would pay in the London area.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By JNO. McINTYRE, Gardener, Woodside, Darlington.

Fernery.—Many species of Ferns are now in a state of inactivity, and some at rest; still, it is possible to make the fernery attractive. If it is the practice to bring on Adiantum capillus-veneris in successional batches, a fernery may be made fresh-looking even now. All decaying fronds should be removed once or oftener in a week. Resting plants if in pots placed elsewhere should be kept out of sight, scale insects sponged off the larger and more enduring fronds. Pockets and bracket-shells and other devices should be nicely edged with small Ferns having fresh young fronds, or with Isolepis gracilis, sinking the small pots in the mould, and generally making the most of the materials at hand. These efforts are always much appreciated in the dull months.

The Forcing-house, — Roman Hyacinths for flowering about Christmas-tide should be introduced in quantity, also pots of Narcissus, not forgetting some of the Temby Daffodil (obvallaris) and Pseudo-Narcissus or common Daffodil, as the plants stand forcing well, and affords quantities of blooms for cutting, as do also the large and small flowering Hoop-petticoat Narcissus in white and yellow varieties, Indian Azaleas, may now be freely forced for flowering in December, selecting varieties with a good set of flower-lands, and in various colours. One of the best white Azaleas Deutsche Perle, should be grown in quantity for forcing, and small plants well set with flower-lands can be cheaply bought. As a good deal of heat is required in this house, say from 65 by night to 75° to 80 by day, a considerable amount of damping down will be called for, and the syringe used on hardwooded plants three or four times a day in bright wooded plants three or four times a day in bright wooded plants three or four times a day in bright conducive to healthy growth than a genial bottomheat of about 80°, obtained by means of a deep bed of tree-leaves, or leaves and stable-manner, although apparatus.

Bulbs for Forcing and otherwise. -- If these bulbs are plunged in coal-ashes, or kept in some other manner from the light, they should now be examined, and those which have made a fair quantity of roots so as to begin to cover the ontside of the ball of soil with a network of roots should be, removed to low brick pits, and placed near the glass, hre-heat being employed to keep out frost, but for no other purpose. To prevent the frost scaling up the coal-ash beds containing bulbs, it is well to cover them with a layer of stable-litter 2 feet thick, or it may be difficult to open them in the event of hard frosts occurring. The Lilies which are to flower late in the spring, or early in the summer, should remain in coal-ash beds, or in beds of tree-leaves, on the north side of a wall throughout the winter. L. longi-florum var. Harrisii, which will not stand frost for any length of time, should be well protected against it. Lily bulbs often get eaten by rats and mice in bard winters, and many a valuable bulb is lost thereby; but protection against these creatures is not difficult. Each pot should stand on a piece of tile or slate, and be covered with another piece, which will do no harm to the growth of the stems if the pots be examined betimes late in the winter, Lily bulbs being usually potted low down in the pots, for the sake of earthing-up the stems as they grow. Having protected the pots in the manner described, tree leaves or coal-ashes (fine) may be packed around and laid on above them. If leaves be used, it should not be in such quantity as will produce heat.

FRUITS UNDER GLASS.

By W. Poet, Gardener, Highelete Castle, Newbury

Earlust Force? Pot Vines. Vines that were started at the beginning of the present month should be showing signs of growth at this date, and a slight increase of temperature, say, 55 at night and 65 by day, may be afforded as a maximum, a small amount of ventilation being given at the upper lights or ventilators on bright days when the warmth has risen to 70, but avoiding a draught.

Early Vime in Borders.—To obtain tipe Grapes in the month of May the vinery should be closed at about this date, especially if the Vines are young and they grow with vigour, such requiring a longer time to start them into growth than aged ones, which may have been forced for a series of years. The canes should be depressed till the upper ends are as low as the point at which they bend upwards,

so as to induce a regular break. If the canes are wetted twice or thrice daily with warm water, and a bed of fermenting materials be placed upon a raised wooden platform, breaking will be considerably favoured. Fire-heat will not be wanted for the first week or two, nor, indeed, till the Vines have broken into growth, nuless the weather should be unusually cold. The heat of the manure should be kept up by the addition of fresh materials at short intervals of time. A temperature of 50° at night, and 55° by day, with a slight rise by sun-heat, will suffice till the buds hegin to move.

The Late Vineries.—Much care is called for on the part of the gardener at this season in preserving the thin-skinned varieties of Grapes hanging on the Vines from decay. The bunches should be examined every day, and decaying berries removed, a gentle warmth being maintained in the hot-water pipes, so as to dispel damp, the temperature being kept about 50°. Ventilate these vineries freely whenever the weather is favourable for doing so. When the loaves have fallen, the Grapes may be bottled if a cool dry room be at command. The Vines may then be pruned and dressed, and as a longer season of rest will thus be afforded them, they will start more strongly next year. To secure the best results, the latest Vines should be started into growth early in the month of March, and Gros Colman even in February, which allows sufficient time for the fruit to ripen before the sunny season ends.

Figs, Early Pot Trees.—These trees should be put in order for a start being made soon. If the pots are placed on pedestals of brick or stone, the spaces between them may be filled in with fermenting material, which may be renewed from time to time as may be necessary, without moving the plants. Rather dry Oak or Beech leaves form the most suitable heating materials, if a small quantity of stable-litter be put with them. A strong rank heat is not desirable, 65° being high enough for the present. The top-heat should range from 50° to 55°. When the bads swell freely, the temperature may be increased to 55° at night and 60° in the daytime by artificial means, allowing 70° to 75° with sun-heat, ventilating as required early in the day. Sprinkle the trees with top-id water every morning, and in the early afternoons of fine days.

THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorking.

cutth gas.—Many of the antumn-blooming Cattleya labiata will be at their best, needing much care in affording water at the root, the young pseudo-bulbs quickly turning black and decay if the compost be kept very moist; or if that does not occur, the plants may start to grow prematurely. After flowering those which produce roots freely from the base of the flowering growth, they may be re-potted or top-dressed, whichever may be necessary.

whichever may be necessary.

Cypripedium bellatulum.—Those who do not succeed with this species should put the plants in the coolest part of the Cattleya house during the winter months, and keep them at the root rather on the dry it.

Ottontoglossum - house. — The lovely Trichopilia (Pilumna) fragrams now in flower will require very little water after the flowers fade till growth recommences, when, if necessary, the plant may be re-potted with safety.

Winter Re potting.—In large collections there will be at all seasons some Orchids requiring to be repotted, but as a rule many plants will be at rest, and others less inactive are better if not unnecessarily disturbed. Those which can be safely re-potted now are Disa granditlora, D. racemosa, D. tripetaloides, D. longicorna, and the hybrids D. Veitchi, D. Kewensis, D. Langleyensis, &c. When breaking up large masses of these plants, a good deal of care is called for on the part of the cultivator, the roots being brittle and early injured. When the specimens are made up again, place the growths which are of one size together so that they may bloom at the same time. To increase the stock of any variety, the long white offsets may be left attached to the tubers, and the following year they may be potted off singly. Disas root freely in black sandy peat, to which are added some chopped sphagunm moss and small bits of limestone. The pots or pans used should be well drained. Plants not requiring to be re-potted should have much of the old soil picked out, and be surfaced with fresh material. During the winter the cool-house is the best one for Disas, but in early spring, when the Odontoglossums need shading, the Disas must be removed to the greenhouse. When Disas are well

established in the new compost, a few heads of live sphagnum-moss should be inserted in the surface of the compost sothat an equable degree of moisture about the roots may be maintained. Pleiones or Indian Crocuses are plants which also require re-potting, &c. at this season. The varieties F. concolor, Wallichiana, præcox, lagenaria, maculata, and its variety alba, are now going out of bloom, and as soon as the flowers fade, new roots push out from the base of the yeung green shoots; then is the time to re-pot the plants. To do this, turn the pseude-bulbs out of the pot, remove most of the old soil, but instead of dividing the pseudo-bulbs and bedding them out, as some recommend, re-pot them in clumps, the psendo-bulbs almost tonching each other. Pots or shallow pans may be used, but those who prefer to grow the plants suspended, will find pans the more convenient receptacles. Ample drainage is a necessity, large supplies of water being required by the plants. Over the crocks place a thin layer of clean sphagnum-moss, then one of the potting material, upon which the base of the clump should rest; and having placed the pseudo-bulbs, fill up around them firmly with a compost consisting of ϵ qual parts of fibrous loam, peat, and sphagnum-moss, mixed with a moderate quantity of coarse silver-sand, the whole of which should have been previously well mixed together. Bare spaces between the pseudobulbs may be filled in with the roughest parts of the compost, giving preference however to the moss. The re-potted plants should be placed near to the roof-glass of the Cattleya or intermediate house, and little or no water should be given. After the lapse of a few weeks, water may be afforded sparingly till tho growths are well advanced, and when thoroughly established the plants will take almost unlimited supplies. The cooler varieties, as P. humilis and Hookeriana, having completed their growth, and as these generally flower in the month of February, they may be suspended close to the glass in the Odontoglessum house, and afforded sufficient water to prevent the pseudo-bulbs shrivelling till that time. In the Mexican division, La lia cinnabarina is starting to grow, and if a larger pet or fresh compost be required, attend to these matters forthwith. The compost best suited consists of fibry peat two-thirds, and sphagnum-moss one-third, with a moderate quantity of finely-broken crocks mixed in it. This species requires earcful watering, for if kept very moist, the roots will decay. It is safe practice to let the soil become thoroughly dry before affording water. In this division Vanda teres will have made sufficient growth for the season, and plants which were given fresh material for the roots to cling to at the right time, have become firmly established. This plant should not be watered heavily as in summer, nor on the other hand, kept so dry as to cause the stems to shrivel, or some of the lowermost leaves will fall off : but afford it a slight dewing overhead whenever shrivelling is feared, and it will keep fresh, and in its proper season bloom abundantly. The flower spikes proper season bloom abundantly. The flower spikes on weakly plants of Lælia albida, L. autumnalis, and L. Marriottiana, should be removed, or the plants will dwindle away. Even strong established plants of this fine species would be strengthened considerably if eased of their spikes immediately the flowers are expanded.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

Sweet Briar.-This species of the genus Rosa is receiving a much greater degree of attention than formerly as plants for making garden-hedges and for decorative purposes, and where a vigorous and hardy plant is required, and apart from the delightful fragrance of all of the varieties, and their varied colours, nothing is more snitable for planting. Lord Penzance's hybrid Briars form a very desirable collection, and every garden of any protentions should include some of them. These hybrids impart to the garden at a dull season a good deal of desirable brightness of colour when the bushes are covered with haws. The following are among some of the finest varieties now in commerce, which can be well recommended to those who purpose planting:-Amy Robsart, deep rose, abundant bloomer, vigorous; Anne of Gierstein, dark erimson, graceful habit; Brenda, peach-colour, bright golden authers, dis-tinct; Catherine Seyton, soft rosy-piuk, free-flowering, perpetual; Flora McIvor, pure white, blushed rose, large flowers, good ; Jeannie Deans, semi-donble, scarlet flowers coming in clusters; Julie Mannering, pearly-pink, deliciously scented, very good: Lady Penzance, copper-coloured, the base of petals a bright yellow, free, very fragrant; Lord Penzance, fawn,

sometimes tinted with pink; Lucy Bertram, deep crimson, centre pure white, distinct; Meg Merrilies, bright crimson, abundantly furnished with fruits, one of the best; Minna, large pure white, tinted blush, of good habit, and vigorous; Rose Bradwardine, clear rose, free-flowering, robust habit.

Christmas Roses (Hellehorus niger) may be somewhat hastened in their time of flowering if handlights or movable frames are placed over the clumps in the open air, keeping them close for a time. The glass should be covered at night if the weather is frosty. Some gardeners lift the plants and place them in gentle heat, but where a sufficient quantity of flowers can be obtained by covering the plants in the above manner it is preferable to do so, the plants being impatient of disturbance at the roots, and suffering from the application of artificial heat. Climate has a good deal to do with the successful culture of Hellebores, and the gardener is sometimes blamed for that which he is unable to prevent. A mild, moist climate appears to suit them best, a fact which may be supported by the enormous quantity of bloom annually grown for sale in Devon and Somerset; and from the fact that roots obtained from those districts persistently refuse to give satisfactory results when planted in gardens in some other counties.

Herbiecous Borders should now be cleared of all dead or decaying growths, if not already done, and the transplanting or re-arranging of the borders proceeded with; after which the surface should be mulched with decayed stable-dung, taking care that the labels are not buried or destroyed when this is done.

Ranneulus.—On light, warm soils, the present month is suitable for the planting of corms. The soil should be well dug or trenched, after affording it a liberal dressing of decayed mannre. Plant in drills 2 inches deep, or throw out the whole of the soil to that depth, and let the corms be about 6 inches apart. The ground should have been well consolidated previously. The month of February is a more suitable time to plant if the land is heavy.

Gladiolus Colviler and its Vorieties may now be planted in a warm, sheltered position if early blooms are looked for, the soil being previously deeply dug, after liberally dressing it with rotten manure. If the ground can be slightly raised so much the better; for although the Gladiolus likes pleuty of moisture, it should pass away quickly. Plant the corms 4 inches apart, in drills about 3 mehes deep, at the bottom of which put a layer of sand for the corm to rest upon. In severe weather protect the beds with straw-mats, which are capable of warding off 101 to 12 of frost.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Peas.-In gardens, the soil of which is of a moderately light kind, a plentiful sowing of Peas may be made about the 20th and onwards to the end of the present month. The sowing of Peas at this season is not generally advocated. A sowing made in heat in January coming as soon, or even sooner; and in heavy land, it is always better to wait till the New Year before sowing in the open. However, in light, warm soils, or where the conveniences for raising Peas in warm pits and frames do not exist, it is worth the risk to made a sowing in this month, which, should the plants pass through the winter safely, will furnish some early gatherings. For such cases I would advise the sowing of the drawf prolific variety ('helsea Gem on a south border. Sow the seed in rows at 3 feet apart in wide drills not more than 3 inches deep. It will be advisable to damp the seed with petroleum, and then roll it in dry red lead, or shake it in a box containing the red-lead powder. This will preserve it from loss by mice, which are troublesome in most country gardens. The seed having a long time to remain in the ground before it germinates, should be sown thicker than at other times, and a mixture of soot and dry woodashes sprinkled in the drills before the sowing is made. William 1. and Ringleader are early varieties, growing 4 to 5 feet high, that may be sown on the open quarters. The land for these early erops should have been well worked, or some plot selected that has been trenched and heavily manured for the preceding crop. It will then suffice to afford it a dressing of wood-ashes or charred refuse and sout, and point the surface.

Herbs.—The shoots of Tarragon being much in request in many establishments all the year round, some of the roots should be lifted from the open

and placed in rather deep boxes with some light soil stuffed tightly around the roots, and placed in a warm-house. The roots of Spearmint may be similarly treated, but Mint is not usually required by the cook at quite so early a time. Boxes filled with Parsley plants should be placed in a sheltered position, out of the reach of frost, such as under south walls, where sufficient protection for the present will be a garden-mat, or something of the kind, suspended over it during frosty nights.

Forcing Asparagus.—The roots will now force more readily, especially those which have been prepared for this purpose, and whose tops ripened off early. The late frosts will have induced a more perfect state of rest if the crowns were exposed to the air. A hotbed about 4 feet in depth having been made up of well-prepared materials, place on it a 1, 2, or 3-light frame, or fill a brick-built pit heated by hot-water as regards the top-heat. To have a lasting but not violent heat, mix fresh stable-litter and Beech or Oakleaves in the proportion of two of the latter to one of litter, and get these into a fermenting condition before making use of them. Trample and beat them whilst making up the bed, and leave it untonched for a few days, then test the heat, and when it appears to be steady at 75° to 80°, and not before, cover the surface after making it up with more leaves-not litter, with a 3-inch layer of loam and leaf-mould mixed; on this place the roots close together, cover to a depth of inches with light soil, and put on the lights. If the heat remains steady, the frame may remain covered with mats till growth commences, when, if green heads are required, light and air must be gradually admitted, affording the latter more or less in accordance with external conditions.

THE HARDY FRUIT GARDEN.

By G. Woodgate, Gardener, Rolleston Hall, Burton- n-Trent.

Planting Trees and Bushes.-- If drier weather has rendered planting possible, let the work be rapidly pushed forward. The planter, before putting a tree or bush in the hole prepared for it, should not omit to cut-back the coarser roots, and such as may be bruised or broken, although many gardeners consider this unnecessary labour, a broken or bruised and twisted root healing and growing as well as one that Roots with a decidedly downward is clean ent. trend should be bent to the horizontal position, or be cut hard-back. It should, however, be remembered, that no standard tree can exist without taproots to steady it, although bushes, pyramids, and espaliers may do so if otherwise supported. The espaliers may do so if otherwise supported. The roots should, however, be spread out when planting radially, and with a very slight dip downwards. Those of the Quince and Paradise stocks, growing naturally or the variace, should not be deeply buried, and may in wet, cold soils, be planted in very shallow holes, the soil being mounded over them. On some stiff clavey lands the same kind of shallow planting is advised, trees on the tree-stock, or the trees may be planted on mounds that have been made before-hand. These should not be less than 12 feet in diameter, nor higher at the centre than 15 inches. This kind of planting ou large mounds answers well tor orchards under grass, but it is ansightly and inconvenient in gardens, seeing that it renders under-cropping in a measure impossible, and is undesirable as well. Whichever method of planting has to be adopted, a few barrowloads afforded to each tree of top-spit soil, of road-scrapings, potting-bench refuse-mould, a sprinkling of lime, charred earth, refuse, &c., all well mixed together, will always be of benefit to the trees. This mixture should be incorporated with the soil at the bottom of the hole, and used to cover the roots when filling in. Having planted the trees or bushes, at once proceed to make them secure against the wind, fastening wall-trees, espaliers, and cordons loosely to the wall or trellis; and standards, bushes, and pyramids if higher than 5 feet to a stout stake, or three stakes placed one foot distant from the stem, using new hay-bands for the fastening. These bands whilst steadying the trees or bushes allow the roots to sink with the soil. The final staking and tieing should be done in April. To prevent the ingress of frost, a mulch of rotten manure about 3 inches in thickness should be placed over the soil as far as the roots extend.

The Fruit room.—Much early fruit will be getting past its best, and decay will have set in, in some of it, rendering a frequent examination of the shelves and racks a matter of importance, one rotten fault soon spreading decay amongst sound fruits. The Apple crop this year being a poor one in some districts, every care should be taken of this kind of fruit.

APPOINTMENTS FOR THE ENSUING WEEK.

CORRECTED AVERAGE TEMPERATURE FOR THE EN-SUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK .- 41'5°.

THE Council of the Reval Horti-The Examinat cultural Societyannou ice that the tions of the next examination will be held in tural Society. the various centres on Tuesday, April 6, 1897. The examination will comprise questions on some of the subjects detailed in the following syllabus, copies of which, with all further particulars, may be had from the Secretary of the Royal Horticultural Society, 417, Victoria Street, London, S.W.

ELEMENTARY KNOWLEDGE ON WHICH HORTICULTURAL PRACTICE IS BASED.

- 1. Soils, good and bad; their nature and composition. Weeds and their indications.
- 2. Requirements of growth -- water, heat, air.
- 3. Seeds: nature of, duration of, vitality in, and modes of germination.
- 4. Roots: nature and functions of; fibrils and roothairs; what they do, and how they do itwhat helps and what hinders them.
- 5. Stems and branches; their nature, work, and uses; helps and hindrances to their work.
- 6. Leaves: what they are, what they do; helps and hindrances to their work,
- 7. Tubers and bulbs, leaf buds and flower-buds.
- 8. Growth and development, increase in size and changes of composition and structure; formation and storage of food materials.
- 9. Flowers: their component parts; what they do; artificial fertilisation.
- 10. Fruit changes and development during ripening; forms and varieties, as, e.g., Apple, Strawberry, Plum, &c.
- 11. Seed formation of.
- 12. Variation and selection.
- 13. Names and orders of common garden-plants, trees, &c.

HORTICULTURAL OPERATIONS AND PRACTICE.

- 1. Surveying and landscape gardening: elements of.
- Choice of site for garden,
- 3. Description and use of implements under each head
- 4. Operations connected with the cultivation of the land, with explanations and illustrations of good and bad methods; digging and trenching; draining; hoeing, stirring the soil, and weeding; watering; preparation of seed-beds; relling and raking, sowing, transplanting and thinning; potting, planting; aspects, positions and shelter; staking; earthing, blanching, &c.
- 5. Propagation. Elementary principles cuttings, hudding and grafting, stocks used, layering, division, branch pruning, root pruning; old and young trees and bushes. Training.
- 6. Fruit culture; open air and under glass; Small Frnits; Apples and Pears; Stone Fruits; gathering and storing; packing and marketing. General knowledge of fruits, and selection of varieties.
- 7. Vegetable culture: tubers and roots; green vegetables; fruits and seeds; rotation of crops, and selection of varieties.
- 8. Flewer culture, outside and under glass.
- 9. Manures and their application.
- 10. Improvement of plants by cross breeding. hybridisation, and selection.
- 11. Arbericulture: trees and shrubs-their culture.
- 12. Insect and fungus pests: prevention and treatment.

ANOTHER of the links between ALELEN the present and the past has dis-CHANIGER, appeared. Times and circumstances have so changed, that but few of the present generation have anything but a hearsay knowledge of the once famous nursery at Vauxhall. The Camellia, for the culture of which Mr. CHANDLER earned his reputation, has gone out of fashion, and Vauxhall is about the very last place in which one would now look for a nursery.

The business was established early in the century, under the style of Napier & Chandler, and on the death of the latter, as CHANDLER & Buckingham. Subsequently it was known as CHANDLER & Sons, under which title it remained till 1858. About fifty years ago the nursery, during the Camellia season, was one of the sights of London, the long-house being certainly a beautiful sight, and unique in its way. Mr. CHANDLER was not only a skilful eultivator, but an excellent artist in watercelours. He figured many Orchids from Messrs. VEITCH's establishment, and leaves behind him an extensive collection of drawings, which will be of much interest a sa record of horticultural progress. A large number of varieties was also raised by Mr. Chandler at Vauxhall, some of which were found to be hardy in that situation, whilst several were illustrated in one or other of the works below mentioned.

In 1820 Messes, Chandler & Bucking-HAM published a quarte volume of plates under the title of Camellia Britannica, and in 1831 a series of plates which PRITZEL characterises as "pulcherrime" was published, the descriptions having been supplied by Mr. W. B. BOOTH, long an officer of the Royal Horticultural Society. The title of this work runs thus :-" Illustrations and descriptions of the plants which compose the natural order Camellia, and of the varieties of Camellia japonica cultivated in the gardens of Great Britain. The drawings by ALFRED CHANDLER, the descriptions by WILLIAM BEATTIE BOOTH, London, 1831. folie xii., 48 pp., 40 tab. col. (pulcherrimie).

Mr. Chandler, who was in his ninety-third year, died at East Dulwich on the 19th inst.

THE announcement we have to ANTHONY make of the death, on the WATERER 16th inst., of Mr. Anthony

WATERER, in his seventy-fifth year, will come with almost as much surprise as regret to those who conversed with him at the last meeting of the Reyal Herticultural Society not a fortnight since. The name of Anthony Waterer, of Knap Hill, was a good deal more than a household word among his associates and fellowcountrymen. In the United States, on the Continent, wherever Rhododendrons can be grown, there were the name and fame of ANTHONY WATERER established. So long ago as 1832, we read of a hybrid raised by him between Rhodedendron arborenm and R. cancasicum, whilst hundreds of Azaleas, even at that time, ewed their origin to him. Since then not a year has passed without the introduction of new varieties; whilst so high was his standard, that the new introductions were certain to be improvements. A new race of Azaleas was raised by him from the Californian R. occidentalis enly a few years since. In many cases, a particular variety which had won the commendation of the experts, was not allowed to get into commerce, either because it did not satisfy the exacting requirements of the raiser, or because he had still better in reserve.

But Rhododendrons and their allies were not the only objects of Mr. WATERER'S predilection. There are fewer greater sources of pleasure in store for the lever of trees and shrubs than a visit to Knap Hill. The variety of ornamental and interesting trees, and Conifers, including Hellies and Yews, was only equalled by the care exercised in selecting and propagating the best. The introduction of the Spiraea known as Anthony Waterer, is comparatively recent, whilst the selected forms of Picea pungens known as argentea, is one of the most beantiful and most hardy of Conifers. Lilies and Primroses also received their share of attention; so that no matter at what season the visit is paid to these vast nurseries, there is certain to be much to interest the visiter.

THE movement for the erection A Statue to of a monument to Charles DARWIN. DARWIN in his native town of Shrewsbury was a good deal stimulated by the discussion on his theories at the Church Congress there last month. It is now announced that the long-debated scheme will be carried out forthwith. The Shropshire Horticultural Society has, we learn, with commendable public spirit, undertaken to bear the whole cost, which is estimated at from £1,000 to £1,200.

This act of the Shropshire Herticultural Society is worthy of the highest commendation. Few men have done more to advance the theory of horticulture, and as a consequence, the successful prosecution of the art, than DARWIN; but it has been left for what we had considered to be a great Flower Show Society, and nothing else, to do this great public duty.

AERIDES LAWRENCEÆ.-By the kindness of Sir TREVOR LAWRENCE, Bart., we are enabled to illustrate the original form of this finest of all the species of Aerides, which was imported from south-east Mindanao in 1883, and named in honour of Lady Lawrence. In the habit of the plant, and in the bright and rich colouring of the flowers, it resembles Aërides quinque-vulnerum, also a Philippine species; but in the more dense arrangement of the flowers it is like Aërides odoratum, which inhabits India and China. To both species, however, it is infinitely superior in point of size, and in the stately beauty of its flowers

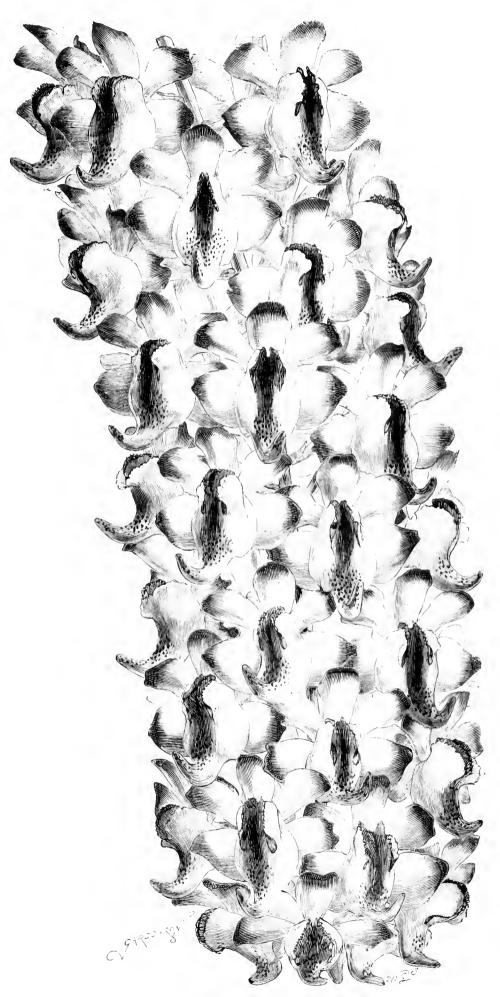

Fig. 109.—Aerides lawrenceæ. (see p. 628.)

which are white, marked with rich amethyst-purple, the tip of the spur being green. Acrides Lawrencem requires to be grown in a warm, moist house.

LINNEAN SOCIETY OF LONDON .-- November 5. -Dr. Genther, M.A., F.R.S., President, in the chair. Messrs. A. B. FREEMAN MITFORD, C.B., and WILLIAM TYSON were elected, and Messrs. Veinon H. BLACKMAN and PERCY GROOM were admitted Fellows of the Society. Dr. MORRIS, C.M.G., exhibited specimens and slides illustrating the occurrence of raphides in the bulbs of the common Hyacinth of gardens (Hyacinthus orientalis and varieties). Forms of cezema were said to have been produced in persons handling and cleaning these bulbs. Although the fact was familiar to gardeners, the cause did not appear to have been clearly traced. Experiments and observations at the Jodrell Laboratory at Kew had shown that both dry and moist scales were capable of producing considerable irritation in certain cases when applied directly to the skin. There was little doubt that the raphides were the prime agents. These needle-shaped crystals (composed of oxalate of lime) varied from $\frac{1}{100}$ to $\frac{1}{200}$ of an inch in length, and were arranged in close bundles, easily dispersed by rubbing the dry scales. In the growing plants they were doubtless protective, as snails for instance avoided Hyacinth bulbs, but attacked others growing close by. Roman Hyacinths (var. albulus) were understood to cause greater irritation than other varieties. Dr. D. H. Scott described some experiments which he had tried, tending to confirm the conclusion that the irritation of the skin produced by contact with the bulb-scales of Hyacinths is due immediately to punctore by the numerous raphides. On behalf of Dr. II. B. HEWETSON, of Leeds, Mr. HARTING exhibited photographs of a specimen of MACQUEEN'S Bustard (Otis Macqueeni) which had been shot at Easington, in Holderness, on October 17 last, and gave a brief account of the species, which had now been met with in England for the third time; the first instance of its occurrence having been noticed in Lincolnshire in October, 1847, and the second in Yorkshire in October, 1892. Mr. Hugh WARRAND exhibited a remarkable bird, which was believed at first to be a hybrid between the red grouse and ptarmigan, but which in the opinion of Mr. OGILVIE GRANT, Mr. MILLAIS, and Mr. HARTING, could only be regarded as an abnormally palecoloured grouse. Only one possible instance had been recorded of such a hybrid as was suggested, viz., in the case of a bird which was exhibited some years ago by Professor Newton to the Zoological Society (P. Z. S., 1578, p. 793), and had since been figured by Mr. MILLAIS in his work on game birds. A specimen of the cream-coloured courser (Cursorius isabellinus), an extremely rare visitor to this country from North Africa (probably via Spain), which had been shot on Salisbory Plain, at Earlstoke, on October 10 last, was exhibited by Mr. HARTING, who gave particulars of the occurrence, and stated that another example of this bird had since been obtained in Fouley Bay, Jersey. A paper by Mr. A. W. WATERS, F.L.S., on Mediterranean Bryozea was then read. Dr. S. Schonland communicated a paper on some new species of Crassula from South Africa, which he had obtained from localities which had been very rarely visited by botanical collectors, and which were believed to be undescribed. Nr. J. G. BAKER, who criticised the paper, spoke in favourable terms of the care which had been taken by the author in its preparation, and thought there was sufficient justification for describing the species mentioned as n ew. revisionary Monograph of the New Zealand Holothurians, by Prof. A. DENDY, D.Sc., F.L.S., of Christehurch, N.Z., was read. The Rev. J. Whit-MLE made some remarks on the Trepang fishery in Samoa, where several edible species of Holothurians are gathered and prepared for the market, and called attention to the well-known fact that a small fish of the genus Fierasfer used the body of the Holothurian as a habitation.

— The next meeting of the Society will be held on Thursday, November 19, at S.P.M. precisely, when the following papers will be read: I. Mr. W. G.

RIDEWOOD, B.Sc., F.Z.S., "On the Structure and Development of the Hyobranchial Skeleton and Larynx in Xenopus and Pipa, with Remarks on the Affinities of the Aglossa: H. Rev. T. R. Stebbing, M.A., F.R.S., F.L.S., "On Amphipoda from the Copeuhagen Museum."

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees of the Royal Horticultural Society will be held on Tuesday, November 24, in the Drill Hall, James Street, Victoria Street, S.W., from 1 to 4 r.m. At 3 o'clock a floral demonstration will be given by the Rev. Professor Geo. Henslow, M.A.

DRAWINGS OF CERTIFICATED ORCHIDS .- At the meeting of the Orchid Committee, on the 27th ult., it was decided to memorialise the Council on the subject of obtaining for reference coloured drawings of the Certificated Orchids shown before the Committee. To this memorial the following answer has been received: "To the Chairman of the Orchid Committee — The resolutions you forwarded to me were duly consided by the Council on Tuesday, and the following resolution was agreed upon, and a copy of it ordered to be forwarded to you; The Council views with favour the principle of the resolution of the Orchid Committee under date of Oct. 28. The Council would now be glad if the Committee will clothe their proposals in such definite form as to details and probable cost, as will supply a basis for discussing them with the Council, or some members of it.' I am, &c., W. WILKS, Secretary." It is hoped that there will be a full attendance of the members of the Committee on Tuesday next to further consider the matter.

GARDENERS ROYAL BENEVOLENT INSTITU-TION.—The Committee of this lustitution at their meeting held on the 13th inst., decided to place twenty candidates from the list of applicants on the funds at the next election, which will take place on January 14, 1897. Of these candidates ten will be recommended for election without votes, they having complied with the terms of Rule III. s. 5, and other rules in connection therewith. The remaining ten will be elected by the votes of subscribers in the usual way. In thus increasing their liabilities by adding to the pension list the largest number of candidates ever admitted at any one election in the history of the Institution, the Committee had in mind the fact that next year will witness the celebration of the sixtieth year of the Queen's reigu, and as Her Majesty has been for forty-five years the gracious patroness of the charity, they intend to appeal to all gardeners, and other friends of the institution, to assist them in making some special effort on its behalf during the coming year in commemoration of an event which is unparalleled in the annals of this country.

THE GARDENERS' ORPHAN FUND. - At the last meeting of the committee, the following special subscriptions were aunounced by the Secretary :-Ealing District Gardeners' Mutual Improvement Society, £15; Canterbury Hospital and Charity Fête. £10; Sandringham Horticultural Society, £5 5s.; Mr. J. Selway, Bettenhaoger, Dover, £3 10s.; Forest Hill and Catford Horticultural Society, sale of Flowers, £2 2s.; small sums, per the Editor of the Gardeners' Chroniele, £1 17s. 6d.; Mr. John Rochford, £1 5s. 6d.; Mr. J. Miles, Southampton, £1 8s.; Mr. W. Stevens, Walton, Stone, box, £1; and small sums, £1 9s. The Secretary announced that Caradian Stock, value £500, had been purchased, thus bringing up the Reserve-fund to nearly £900. A letter was read from Mr. John Fraser, resigning the 1 ost of auditor he has held since the establishment of the Fund, assigning as a reason the claims of business. The committee learned the fact of Mr. Fraser's resignation with great regret, as he had proved a most painstaking auditor.

NATIONAL HORTICULTURAL SOCIETY OF FRANCE.—M. VIGER, the Minister for Agriculture, has been elected President of the Society by an almost unanimous vote. The number of voters was

324, so that 163 votes would have constituted an absolute majority. M. Viger obtained 303 votes.

HORTICULTURAL CLUB. — The monthly dinner and conversazione took place on Tnesday, the 10th inst. Owing to the number of Chrysauthemum shows going on, in which so many of the members were interested, the meeting was comparatively a small one, which was the more to be regretted because a very interesting paper was read by Mr. Charles E. Pearson of Chilwell, Nottingham, on "New Varieties of the Chrysanthemum." A discussion took place afterwards, in which most of the members joined; and a vote of thanks was unanimously accorded to Mr. Pearson for his excellent paper—which we hope to give in a future issue.

EDINBURGH CHRYSANTHEMUM SHOW.—As this sheet is passing through the press, we learn that at the great Chrysanthemum show in the Waverley Market there are over 900 entries, and nearly 200 competitors. The show will be continued for three days.

NATIONAL CHRYSANTHEMUM SOCIETY .-- A meeting of the Floral Committee took place on November 18, and some interesting novelties were staged. One important point came up for discussion as to the position of some of the newer incurved types. At the last meeting of the committee, it was decided that incurved Duchess of Fife is au incurved Japanese, and yet on the occasion of the Jubilee Show this variety was included in the stands of incurved, and passed by the judges. It was eventually decided that the Floral Committee recommend the General Committee to take some action in reference to the incurved varieties, with a view to a fresh classification, if necessary, First-class Certificates of Merit were awarded to Japanese, Simplicity, a white reflexed variety in the way of Madame Carnot, pure colour, fine petal; and Sunstone, soft yellow, deeper in the centre, full and pleasing. These are varieties raised by Messrs. NATHEN SMITH & SON, Adrian, Michigan, and were exhibited by Mr. NORMAN DAVIS, Framfield, Sussex. The same award was made to Japanese, Joseph Brooks, yellow and deep apricot on the surface, deeper on some of the older flowers, a fine full variety of much novelty of character, from Mr. W. SEWARD, Hanwell; also to Mrs. Marling Grant, a seedling from Gloire du Rocher, colour, apricot, deeper on the basal petals, full and very attractive, from Mr. W. Jinks, The Gardens, The Beeches, Walton on Thames: a Certificate of Merit was also awarded to Mr. A. G. HUBBUCK, orange crimson with a straw-coloured reverse, a bright tinted, large, and full flower of cousiderable merit. It was exhibited by Mr. W. H. LEES, The Gardens, Trent Park, Barnet, and Mr. H. J. JONES, Lewisham, but in accordance with the rules of the Society, the Certificate went to the former as having the best blooms.

CAMOENSIA. — A few particulars gleaned at Kew may be added concerning this remarkable plant (figured in our last issue, pp. 597 and 601). The roots are apparently destitute of the nodules which ch racterise so many of the Leg uninose, a fact which points to a different life-history. The young shoots, like the stipules and young leaves, are densely covered with coarse brown one-celled ribbon-like hairs. The lanceolate stipules are much in advance of the leaves in development, and act the part of bud scales by protecting the young leaves on the fast-growing shoots. Judging from the native country of the plant, this coating must be needed to prevent excessive evaporation rather than as a protection from cold. The leaflets are con-duplicate, the terminal one being the first to develop, so that the development of the leaf-blade, as a whole, is from the tip downwards in a centrifugal manner. The development of the petiole on the other hand is just the reverse, from below upwards or basifugal. At the base of two lateral leaflets are two small stipella, which are probably rudimentary leaflets. The stalks of the leaflets are much thickened, especially on the under surface, so that, in all probability, the leaflets are endowed with extensive powers of movement

according to the exigencies of the plant, and the nature of the surrounding conditions, such as light. The woody tissue of the petiole forms nearly, if not quite, a circle. The stomata, which are oval, are extremely numerous on the under surface of the leaf. The pollen was figured by Mr. W. G. SMITH in the illustration at p. 601.

BOTANICAL MAGAZINE.—The plants figured in the November number are the following:—

Cycnoches Haagii, Rodrigues.—A species from the delta of the Amazon, with flowers of moderate size, and lurid green colour. Kew; t. 7502.

Rhododendron serpyllifolium, Miquel. — A dwarf species like R. (Azalea) amona (see Gardeners' Chronicle, 1882, vol. i., 429): t. 7503.

Pontstemon azurcus, Bentham. — A Californian species, varying greatly in stature and habit. The lower leaves are linear-lanceolate, tapering to the base; the flowers in terminal racemes, purple, streaked with rose; t. 7504.

Harrothia xiphiophylla, Baker.—A new species, with tufted, linear-lanceolate leaves, beset with translucent prickles, and central racemes of small cream-coloured flowers. Native of Cape Colony; t. 7505.

Acantholimon venustum, Boissier.— A hardy Statice-like plant, with tufts of linear leaves, and spikes of pink flowers. Native of Asia Minor; t. 7506.

LIBRARY OF THE LATE WILLIAM MORRIS.—
The Times, in its issue of Nov. 7, in the course of an article on Mr. Morris's library, has the following:—
"Of herbals, of which Mr. Morris was a great lover, he possessed a copy of the earliest of all—that printed at Spira [4] by John and Conrad Hist [4], about the year 1480; ho also possessed a copy of the finest of all—that of Fuschius, printed at Basle in 1542, and this copy is in its original stamped binding. The earliest productions of the presses at Augsburg and Ulm, the collection is singularly rich." The Herbal of John and Conrad Hist is not mentioned in Pritzels Thesaurus. Can any reader give us further particulars about it?

A PREVENTIVE OF CANKER IN THE APPLE.—Every gardener will be glad to know of the following remedy for that troublesome malady—the canker affecting the stem and branches of the Apple. Superphosphate of lime, 12 lb.; nitrate of potash, 10 lb.; Sulphate of lime, 8 lb.; common salt, 4 lb.; sulphate of iron, 1 lb. Mix these different substances intimately, and apply at the rate of 4 oz. to 1 square yard of land. We are indebted to Mr. T. F. RIVERS of Sawbridgeworth for the formula.

THE SURVEYORS' INSTITUTION. - The next Ordinary General Meeting will be held on Monday November 23, when a paper will be read by Mr. WALTER C. RYDE (Associate), on "The Agricultura-Rates Act, 1896." The chair will be taken at 8 o'clock. Those proposing to enter their names for the Students' Preliminary Examin tron, to be held on January 20 and 21 next, must intimate their intention to the secretary before the last day of November. It is proposed to examine candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmoreland, and Northumberland, at Manchester. Candidates from other counties in England and Wales will be examined in London. Irish caudidates will be examined in Dublin. The Students' Proficiency Examination will commence on March 22 next. Examinations qualify ing for the Classes of Professional Associates and Fellows will also commence on March 22 next. All particulars as to the days, subjects, and course of examination will be forwarded on application to the secretary. Candidates for the professional examinations will be examined in London only.

—- Notice is also given that the next Special-Certificate Examinations in Forestry, Sanitary Science, and Land Surveying and Levelling, are proposed to be held on Tuesday, Wednesday, and Thursday, June 15, 16, and 17. Particulars of these examinations can be obtained from the secretary.

MAXILLARIA STRIATA, ROLFE.—This is one of the prettiest of the Maxillarias in the group made familiar to us in gardens by M. grandiflera and M. venusta, both of which have white flowers. It was first made known by plants imported from Peru by Messrs. Linden, of Brussels, from whose first specimen Mr. Rolfe named and described it. Later it was exhibited at the Royal Horticultural Society by Mr. Moore, from the Royal Botanic Gardens, Glasnevin, Dublin, when it was awarded a Botanical Certificate; and still more recently by Messrs. F. Sander & Co., of St. Albans, who secured for it an Award of Merit, their plant supplying the subject from which our illustration (fig. 110) was taken. The sepals and petals are yellow, striped with red-brown, and the lip white with purple veining. Like the others of its class, it is an easy plant to grow, if placed in a cool intermediatehouse.

land for the purpose of husbandry only." The presumption seemed a very natural one, but as the ways of taxmakers are not always as those of other men, it was determined to sound the Commissioners of Inland Revenue on this point. The surmise was not ill grounded, as the following extract from the reply, dated November 12, testifies :- "The leaflet to which you refer does not apply to nurseries and market gardens. Ever since the imposition of the Income Tax in 1842, the assessments made under Schedule B in respect of the profits arising from the occupation of nurseries, or gardens for the sale of produce, have been based not on the annual value of the lands, but on the actual profits estimated according to the rules of Schedule D of the Income Tax Acts." Payment of taxes on profits realised—that is, after marketing the harvest would save a great deal of trouble, and would certainly be most just to the gardener or nurseryman; what the

Fig. 110.—MAXILLARIA STRIATA.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.—The annual November exhibition of autumnal flowers and fruit, under the auspices of the National Amateur Gardeners' Association, was held on Tuesday night, 10th inst., in the Memorial Hall, Farringdon Street. Arranged upon the benches was a very fine display of Chrysanthemums, all grown by members of the association, and the Ryecroft championship prize for twelve cut blooms of Japanese Chrysanthemums was awarded by the judges to Mr. H. A. NEEDS, of Woking. The Cheal trophy for fruit was won by Mr. F. M. Vokes, of Southampton. During the evening a meeting of the members was held, a paper on "Cool Orchids" beiog read by Mr. W. Baxter, of Woking.

Market Gardeners and the Income Tax.—At p. 531 of our number for October 31, under the heading of "Farmers and the Income Tax," attention was drawn to the issue by the Board of Agriculture of a leaflet designed to advise farmers on matters relating to the Income Tax as payable by them. The paragraph in question closed with the words: "It is to be presumed that market gardeners have the same statutory rights as farmers or persons occupying

objections to this may be might interest not a few of us to learn; we commend the subject to the chairman of the Board of Agriculture and to the Chancellor of the Exchequer.

HARRISON'S YELLOW ROSE.—Messrs. PAUL & SON, of the Old Nursery, Cheshant, send us flowering specimens of the double yellow Austrian Briar, a variety of Rosa lutea. It is singular that we should have received this from two sources this autumn. We do not remember ever before to have seen it flowering a second time in one season.

M. BERGMAN.—We understand that M. Fleddinand Bergman is about to leave Ferrières, and that his son, M. Ernest Bergman, will leave at the same time. A successor is already appointed. Freddinand Bergman was born near Melun in 1826, and in 1837 entered the gardens of Baron James de Rothschild as an apprentice. In 1843 he visited England, working at Chatsworth under Panton, who subsequently laid out the park at Ferrières. From Chatsworth Bergman went first to Messrs. Lee of Hammersmith, then to Rollisson's at Tooting, afterwards to Dalkeith, and ultimately to Baron Hugel at Vienna.

In 1846 Baron Rothschild appointed him to take charge of the park and gardens at Ferrieres, where for the most part he has remained. During the Franco-Prussian war, Bergman remained at his post, and owing to his zeal and tact, comparatively little injury was done by the invading troops. In 1887 the fiftieth anniversary of his horticultural career was celebrated, the opportunity being taken by his friends and associates to present him with an appropriate mark of their esteem.

THE ROOT TUBERCLES OF LEGUMINOSÆ.—
In the last number of the Comptex Rewlus, M. NAUDIN
expresses some doubts as to the alleged power of
microbes to effect the fixation of nitrogen. M. NAUDIN
calls attention to the fact that Robinias, Cercis,
Gymnocladus, and many other genera are cultivated
successfully in the absence, as it would seem, of any
bacterium special to them. Seeds were sown in soil
which had been submitted to prolonged boiling, in
order to kill the microbes. The result was that
plants grown in soil thus sterilised germinated more
rapidly, and the seedlings were more vigorous, than
those grown in ordinary soil.

FIBRES.—A Travers Lecture on "Recent Researches in Commercial Fibres," will be delivered at the London Institution, on Monday afternoon, November 30, at 5 P.M., by Dr. Morris, C.M.G., Assistant Director of the Royal Gardens, Kew. In view of the considerable interest taken at the present time in China-grass and Ramie, these abres will be particularly dealt with. The lecture will be illustrated with lantern slides and specimens.

CHRYSANTHEMUM MADAME CARNOT.—We hear from Mr. Wells of the Earlswood Nurseries that this exceedingly popular, large-flowered, white Japanese variety, has given a canary-yellow sport. Flowers will be exhibited at the meeting on Tuesday next of the Royal Horticultural Society.

CHRYSANTHEMUM AWARDS. In addition to the Awards of Merit given in our report of the last meeting of the Royal Horticultural Society, an additional one was unanimously recommended to Japanese Madame Paul Lacroix. Three excellent blooms were shown by Mr. P. O. Knowles, gr. to F. C. Crist, Esq., Henley on Thames. As shown, the blooms were very deep, having florets of moderate width, but of considerable length. The colour was bright but rather pale yellow, passing to very pale lifac in the oldest floret. The variety has been in commerce for two years or more.

SWANSEA AND DISTRICT UNITED GARDENERS' ASSOCIATION. -We learn from Mr. MILNER, gardener at l'eurice Castle, that the gardeners of the district around Swansea are to be congratulated on the success they have so far attained in establishing an association for the encouragement of horticulture in this prosperous district. The committee is very grateful to Sir John T. D. Llewelyn, Part., M.P., for the great interest he is taking in the matter, and also for kindly undertaking the office of President for the ensuing year. The Committee have arranged for a series of papers to be read during the winter months on different subjects relating to gardening, and they are looking forward hopefully to being enabled to have a summer show in Swansca, the suggested site being the new Market Hall, which is near completion, and which will undoubtedly be one of the finest sites in the kingdom. The hon, secretaries are Messrs, A. K. DRUMMOND and W. DAVIES. It is intended that the following papers shall be read during the winter season, 1896-97, in the lecture-room of the Public Library : 1896 - November 19, by Mr. W. W. Petrickew, Superintendent of the parks and open spaces, Cardiff; subject," The Process of Fertilisation." December 17, by Mr. W. S. GILDERT, The Gardens, Baglan Hall; subject, "Chrysanthemums and their Culture." 1897-January 11, by Mr. R. MILNER, The Gardens, l'enrice Castle , subject, "Apples and their Culture." February 18, by Mr. C. H. Evans, Swansea; subject, "Parks and Open Spaces ' (illustrated with lanternslides). March 18, by Mr. Foote, The Gardens, Clyne Castle; subject, "The Peach: Its History and Culture." Meetings to commence at 8 p.m.

LARGE POTATO.—Mr. MILLER, of Fairlie, N.B., is getting to be well known in the north as a grower of Potatos. He has produced a lot, nine of which weighed a stone of 14 lb.; the largest of these turned the scale at 2 lb. 3 oz.! Truly, a gigantic specimen.

CROSSES BETWEEN THE MARGARET AND TREE OR PERPETUAL-FLOWERING CARNATIONS.—We remark in the report of the meeting of the Prinsian Horticultural Society on October 29 last, that Mr. Behrens exhibited some very pretty crosses between Margaret and Tree Carnations, some cut flowers of which had been already shown from the same plants in August, and at the end of October the plants were still beautifully in bloom. The characteristics of the crosses are, the non-liability of the calyx to split, perfect hardiness, coming true to colour from seed, long duration of flowering, and of the blooms when removed from the plants.

GERMAN CYCLAMENS.-The following is a brief description taken from the Gartenflora of the treatment pursued by H. TUBBENTHAL, of Charlottenburg, with Cyclamens. It may be noted that it was this cultivator's plants which the Prussian Horticultural Society selected for comparison with plants raised from English seed. The compost which he uses consists of peat, four parts; hot-bed soil, two parts; leaf-soil, one part; and half-a-part, sand. The seed was sown in October; the seedlings pricked out at the end of December, shifted into pots at the beginning of March, and put into their flowering-pots at the beginning of August. At the end of that month they were removed from the frames in which they had been growing, to a house, the plants doing better in the latter.

HOME CORRESPONDENCE.

A HORTICULTURAL INSTITUTE. - No one is more anxious than myself that a suitable building be provided in London where horticultural societies can hold their meetings for business purposes; but the provision of a hall suitable for large exhibitions is a matter of considerably wider range. My experience of Londou exhibitions, which may be said to have begun with the first National Rose Show in St. James Hall in 1858, leads me to the conclusion that a building suitable to hold an exhibition on anything like an extensive scale must not only be very large, but also contain the needful offices, adding considerably to its area and cost. There is no building in London other than the Aquarium, the Agricultural Hall, or Olympia, that can accommodate the ordinary exhibitions of the National Chrysanthemum Society, and leave the necessary spaces for locomotion. I do not forget the Crystal Palace, but it is a scrious railway journey from London to reach it, and this makes its use for large exhibitions one of expense and labour. Probably St. Stephens' Hall at the Royal Aquarium is one of the largest in London; it is 136 feet in length by 80 ft. in breadth, and yet, though almost completely filled on the occasion of the recent Jubilee Show, it only accommodated about one-fourth of the exhibits. Some idea of the extent of tabling required to stage a large exhibition of cut flowers and other things requiring tables may be gleaned when I state that there was provided at the Jubilee Show about 7600 superficial feet of tabling; of this amount nearly 3000 feet was on the ground-floor, 2150 in St. Stephen's Hall, 1420 in the north gallery, and 740 in the south gallery, and this in addition to the floor space occupied by groups. These statistics show that a hall capable of containing a representative exhibition must not only be very large, but have galleries as well, in addition to the necessary offices and places for stowing away such stores as tabling, &c. Such a building could be erected and properly fitted up only at an enormous cost. Then there would be rates to pay, and a large sum annually for keeping the building pay, and a large sum annually for keeping the building in repair, insurance premiums, &c. If only the Crystal Palace, the Agricultural Hall, or Olympia were nearer the centre' Olympia has the nearest approach to a horticultural hall, only that the light is defective; but it needs to be nearer to Charing-Cross to be readily accessible. In this respect, the Royal Aquarium has an immense advantage over every other public building of its size; but no one can possibly regard it as an ideal place for such exhibitions. It also possesses ample side-buildings, for the storage of tables and other accessories. A horticultural hall suitable for business meetings and small gatherings like the bi-monthly ones of the Royal Horticultural Society, the Carnation and Auricula Shows, and the meetings of the Floral Committee of the National Chrysanthemum Society, Committees, &c., is possible; but a big hall, capable of containing the exhibitions of the National Rose and the National Dahlia Societies, to say nothing of larger requirements, is, I fear, likely to remain an unrealised longing, despite many ardent desires that such a place should be provided. R. Dean.

HORTICULTURAL HALL.—Residing, as 1 do, a long distance from London, my visits are somewhat infrequent; nevertheless, I have just as much sympathy with horticultural progress as to cordially re-echo your own remarks pp. 564 and 568, as also Mr. Wood's, p. 568, as 'to the desirability of a horticultural hall being built or beguu in London next year. I am assuming that horticulturists, as a body, will be desirous that something should be done to mark the sixtieth year of the Queen's reign. To my mind the originators of such a scheme will necessarily be residents in or within a reasonable distance of Londou. What more likely body to do this than the Council of the Royal Horticultural Society? course, it would not be wise to confine the use of the building to the purposes of that body alone. But as the natural leaders of progressive horticulture, they should take the lead in such a matter. Representatives of other horticultural societies could join them. Perhaps some Government influence could be "got at" by getting the authorities of Kew Gardens to join as well. In these days of rapid communication, much of which, as a natural course, gravitates to the metropolis, doubtless there are hundreds of persons who are able, and willing, to subscribe to such a fund, if it was only properly put on foot. It may be said there is time enough yet; but in view of the many other objects that doubtless will be brought forward, I for one do not think there is much time to lose in making a start. Seeing that, so far as charitable institutions are concerned, horticulture is well equipped already, there is no need to fear division of opinions on this important part of horticultural duty. One more matter I venture to suggest in conclusion, viz., that all subscriptions to such a fund as is herein suggested should have attached to them some advantages in the shape of life or annual membership, in accordance with the amount subscribed. L'orkshire. Gardener.

CHRYSANTHEMUM BEAUTY OF TEIGNMOUTH. -After reading Mr. Godfrey's note in Gardeners' Chronical of the 7th inst., and seeing a small flower of James Lynch in his exhibit at the National Chrysauthemum Society's show at the Aquarium, which was said to be the true, and as, I think, worthless Pride of Madford, I would like to give your readers another history of the Pride of Madford and James Lyuch. These two varieties were sent to Mr. Salter, gardener at Woodhatch Lodge, Reigate, in 1893, both named Pride of Madford, but were found to be dead on arrival. I believe both Mr. Owen and Mr. Caonell imported these two varieties for the follow ing season, and one or both of them were to be found in their catalogues. Messrs. Hannaford & Sons must have got the names mixed or lost in transit, when they received them in 1894, at which time the varieties had already been named and distributed in Australia, and exported to England. Beauty of Teignmouth is no other than Pride of Madford; and I know its history. I introduced it, and was awarded the F.C.C. at the National Chrysanthomum Society, on October 21, for Pride of Madford, syn. Beauty of Teignmouth. It is an Australian variety, and was named by Messrs Hannaford, and to them be the credit for such a graud variety. We have also to thank them for other good varieties, viz., Oceaua, Australie, and C. B. Haywood, the last-named one of the grandest flowers, and easiest grown of any Chrysauthemum that we have. Those who were so fortunate as to see eight or ten plants at Woodhatch Lodge, each carrying three grand flowers, will not easily forget the sight, for the bloom on it is equal in size to that of Australie, but the shape and make are those of the old Maiden's Blush. This variety was distributed very late in last spring, so that no other grower besides Mr. Salter (who had the stock) had a chance of growing it as he was enabled to do. Those growers who like "woppers," must not omit to get it. A flower of Pride of Madford when badly grown from the first crown-bud, and that of a good broad-petalled Duke of York, well grown, so nearly resemble each other, that I do not wonder that even Mr. Molyneux was struck with their similarity; but when Pride of Madford is at its best, this similarity does not exist. The first crown-bud is certainly the proper bud to take, although it comes a bit too soon for November shows; but the flowers from the second crown-buds show an eye, and the florets are reflexed, making the flower appear quite different, but the colour is splendid. W. N'ells, Earlswood.

WHAT CONSTITUTES A "CRISPUM?"-At the Royal Horticultural Society on the 10th, while discussing Mr. Thompson's so-called "Od. crispum Golden Queen," this question was put to me by one of the little knot of "discussants" (to coin a new word, as we were not disputing, as that practice would illbeseem the Royal Horticultural Society). I wonder how many of us really know what our reply would be were we asked by one who said he did not know, and believing us to be better informed, awaited the hopedfor information, which I think, in many cases, would render the ignoramus "still wiser." If all the plants that have been certified by the Royal Horticultural Society and other societies the world over could by any improbability be got together in bloom for the ignoramus, and "That is Od. crispum," be told him as the world's reply, he would probably say "Oh," for I feel certain he would never recover the shock to get more breath. He might think to himself "Well! it it is pretty variable, at any rate." From the outset, in the days of Bateman, Od. crispum was mistaken by him when he saw it, and re-named Lindley's species after H.R.H. the Princess of Wales. What would be say now were the thousands of much-mixed forms to be presented to him? Perhaps if all who have a theory were to have a meeting and settle the points that determine a "crispum," we should be able to lay down somewhat of a law whereby plants in future could be correctly named, and hybrids be relegated to their nearest namod distinct forms, that can be always known when seen. To facilitate an argument that I hope will lead to this desirable end, I will air my theory with the hope that others will add their voices to the solo, and by making it a chorus we shall get an ensemble that will be of lasting use to us all. To get a clear idea, I commence with three bases (N.B., I was in Ireland once!). There are three so-called species together, Odontoglossum crispum, gloriosum, and luteo-purpureum, (odoratum as understood by some, comes from a different place), and as a rule they are supposed all to grow at Pacho (Sambo would say, "Mighty big Patch O" too). Look over 1,000 in bloom at once out of one importation, and you will see a large majority of white or rose-tinted forms, these I believe to be crispum; you will also find a small percentage of gloriosum, and possibly a still smaller one of luteo-purpureum. You will find a small proportion of hybrids called O. Andersonianum (crispum × gloriosum), and also possibly a still smaller number of hybrids called Wilckeanum. three species and their resulting primary hybrids are the first links in a terribly long and confusing chain. Luteo-purpurcum and gloriosum are easily known; therefore, why not crispun? The true crispum, I beliove, is the spotless form that has a yellow disc to the lip, two yellow teeth at the base, and the two plates at the sides of its channel under the column, only sufficiently raised from the surface so as to expose the ends of the nerves like tiny points. As soon as the yellow usurps more than the disc of the lip, and as soon as epots and marks appear, then 1 consider that there is an evidence of hybridity. No one can tell the myriads of cross fertilisations that have taken place. This has been proceeding till one can only fancy there is not a true crispum left. I have no doubt I shall be confronted with all sorts of crushing arguments. I hope to be able to reply, and if I am beaten, there are many who can take up the cudgels. Between us we may elicit some useful information. de B. Crawshay. [What were the characteristies of the plant first introduced !— Ed.] [What were the

NOTES ON GRAPES.—Considering the present "express" mode of cultivating the Grape-vine, it is rather surprising that we have not seen and heard more of the new varieties, Lady flutt and Appley Towers, than we have done. When introduced they were brought prominently before the public by tempting descriptions from competent authorities, which induced me, and doubtless many more, to give them a trial, but since their distribution compara-

tively little has been heard of them, either for or against, and this must be my apology for troubling you with my experience with these varieties. The most convenient way in which I could test them was by inarching them upon some three years' planted Vines, Lady Hutt on Foster's Seedling, and Appley Towers on Madresfield Court, growing in a house otherwise devoted to Black Hamburghs, which are ripe in August. They are both robust growers, and show fruit and set freely. Lady Hutt, in particular, has very large foliage, which obliges me to have the spurs unusually wids apart, and the laterals severely stopped, in order to let the sun in amongst the shoots to mature them and colour the fruit. The bunches of this variety are fairly large; our best weighed 41b.; the bunches taper regularly down from rather large shoulders. The berries are the size of those of an ordinary Black Hamburgh; thin-skinned, globular, and in flavour sweet and crisp, improving by the fruit being kept some weeks after it is ripe. It is, to my taste, much better than either Foster's Seedling, Euckland Sweetwater, or Mrs. Pear-There is something about it that reminds me of son. the Royal Muscadine when well ripened outdoorswhich may not appear a high attribute; but tastes differ, and I may mention that I know an invalid lady who preferred Muscadines of this description to the best Muscat of Alexandria or Mrs. Pince. One fault it has, namely, its colour, a greenish-white, which may account, to some extent, for its lack of popularity. I cannot speak from experience of its keeping properties further than say it is in this respect considerably better than the Black Hamburgh, for owing to cultivating it in a vinery which is cleared of its crop in the month of November, ne attempt could be made to keep the fruit to a later date. Although it is said that Appley Towers Grape was raised from a seed taken from the same berry as that which gave us Lady Hntt, there is not much in common in these varieties. In foliage, flavour, culour, and shape of berry, they are quite distinct. Appley Towers has characteristics which much more closely resemble Black Alicante. Particularly is this noticeable in the foliage, and the shape, size, and colour of the fruit. In some other respects, however, when compared with that useful variety, it is, as most will allow, its superior. In flavour it is more piquant, the pulp is firmer, and as far as my observation goes, it will compare favourably with Black Alicante as a good keeping Grape. It does not equal Alicante in size of bunch, my largest having scarcely reached three pounds weight. The bunch is tapering, with prominent shoulders. My remarks apply to the variety werked upon a Madrasfield Court stock, and inarched upon an Alnwick Seeding Vine in another house, where its bunches and berries are smaller, although there is no difference in flavour. I have not previously had Gres Maroc so well flavoured as this year, which fact may be attributed to the unusual amount of sunshine afforded in this year, and there can be no question that the lack of flavour in Gros Maroc, and that of some ethers, Alicante in particular, sometimes apparently arises from the Vines being grown too cool. There is no comparison between the flavour of Gros Maroc and Gros Colman as grown here, the first-named being much the better, yet not so good as that of Alnwick Seedling. Gros Colman always had (I do not now grow it) an insipid and earthy flavour, for which our lieavy soil may in a measure be responsible. I could not, however, obtain so good a degree of colour in the fruit as some gardeners do. When cultivated as were the bunches exhibited recently at Hereford by Mr. Grindred, it is a magnificent-looking Grape, and causes one to cease to wonder why good flavoured varieties are sometimes sacrificed for appearance sake. The. Coomber.

PERENNIAL ASTERS AS POT-PLANTS.—In reference to a note about these on p. 600, I may say that during a recent visit to Aix-les-Bains, I was much struck in Miss Willmott's beautiful garden at Tresserne by an arrangement of pot-plants on a stage opposite the drawing-room windows. The mest conspicuous flowers were some pots of Leonetus leonurus, which I have never seen out-of-doers in England; next to these in merit were many pots of Aster Novæ Angliæ iu various shades. These were flowering profusely all through October, the plants being not mere than a feet high. As 5 feet is the lowest height at which I have ever persuaded this Aster to flower in my garden, I was curious as to their treatment. They were grewn by M. Tissot, who has a nursery-garden belonging to a large orphanage at Chambery. He informed me that these plants were grown from young shoots taken off in February. They

are potted at once, and stopped three times during their growth, the last shortening being at the end of June; they are grown out-of-deors the whole time. I am afraid that the ordinary English summer is hardly hot enough to admit of this plan being exactly followed; but the idea of autumn decoration with potted Michaelmas Daisies deserves more attention than it has yet received in England. C. Wolley Dod, Edge Hall, Malpas.

SOCIETIES.

ROYAL HORTICULTURAL. Scientific Committee.

NOVEMBER 10.— Present: R. McLachlan, Esq., F.R.S. (in the Chair); Dr. Bonavia, Dr. Russell, A. D. Michael, Rev. W. Wilks, J. Weathers.

Carnation Disease.—In reference to the diseased Carnations exhibited on October 27, Mr. Bouglas wrote, saying the disease was caused by Bacterium Dianthi, Arthur, and that the disease was known in the United States as Bacteriosis, Mr Massee of Kew says. "Plants if strong and healthy may be kept free from the disease by keeping the foliage dry, and preventing the presence of aphides. Overhead spraying should be done only occasionally on bright days, the water containing only a small amount of ammonical coppercarbonate."

Abnormal Cuttleya —Mr. E. St. John Tacker, Sydenham, sent a pseudo-bull of Cattleya labiata automalis which, instead of developing a flower, produced six sheaths one within the other from the apex of the pseudo-bulb. Mr. Tucker thought a magget might have been the cause of the freak, but beyond a small hole in the outer sheath there were no signs of insect attack.

Fortilising Lee of Cotasitum toldentotum, Hock—Specimens of this bee which had been sent to Kew by Mr. Hart of the Botanic Gardens, Trinidad, were exhibited. They were of a metallic shining emeral-degreen colour, and somewhat larger and rounder than an ordinary house-fly. The name of the bee is Chrysantheda nitida. It is a native of S. America.

Mustard Bratle.—A box of living beetles known as Phaedon cochlearia: was exhibited. These beetles devour crops of Mustard in the eastern counties, and are very destructive.

Swede Turnip with "Fingers and Toes,"—Mr Jas, Long of Wisboch sent a specimen of Swede affected with this myxomycetous disease, Plasmodophora Brassicae. It was stated that there would be a group of fifty or sixty plants affected with the disease in a crop of several acres, and no particular notice was taken. In fact, the diseased plants were allowed to produce seeds, which afterwards developed healthy plants.

Colour Experiments.—It was decided that Dr. Russell, Mr-Wilks, and Professor Henslow should use some of Judson's dyes with a view to their absorption by the roots of Hyacintha under experiment.

NATIONAL CHRYSANTHEMUM.

CONFERENCE (November 5),

(Concluded from p. 603).

The points of quality on properties of the various types as Exhibition Flowers, and the values to be apportioned to each.

Mr. Norman Davis, Chrysanthemum Nurseries, Camberwell, said: At the present time there was a great diversity of opinion as to the estimate to be placed on the various points which go to make up what was understood as quality, much of which appealed to the taste and fancy of the individual rather than to the practical side of the question—even experienced judges differing over quite minor points. It was no wonder, then, that exhibitors so often complained that they did not understand the principles which underlie competent judging, and had nothing to guide them. He could not, of course, agree to any rules tending to require judges to expand their decisions at the beek and call of exhibitors; still, it was not only desirable that judging should be more uniform in character, but a defined system, free from complications, would tend to give judges more confidence in their decisions, if for no other reason than that the public understood them. The greatest difference of opinion which existed among experts lay in the value to be attached to different qualities as were found in the various types of blooms. Now, there were something like seven cardinal points in a flower, each of which had to be studied and appraised in order to find the total value of each bloom. Some experts considered depth of flower a supreme point; others valued most width of floret; while some again regarded form, solidity, or length of floret as cardinal virtues; but he did not suppose that any practical man would desire to convey the idea that if a floret was broad it would be accorded high points, however defective it might be in other qualities, or that a deep and solid bloom should be similarly regarded if it was narrow and wanting in a due proportion of other points of merit. These qualities were essential where they were characteristics of a type; but taken by themselves they should not be allowed to override other considerations, and should always be estimated in con-

junction with other well recognised qualities. In the great Japanese class were found flowers of totally different characteristics; as for instance, the "Phobus" type, with its great depth of bloom, though of moderate width; "Mutual Friend," a shallow flower, but with immense long florets; and "Edwin Molyneux," in which width of floret was grandly characteristic. So he thought it would strike most of them that to take any particular characteristic and attach a cardinal value to it could only lead to the greatest confusion in judging. Separate features did not make up the perfect flower; perfection lay rather in the well-balanced proportions of all essential qualities in the same flower. The perfect flower, and whatever type it might be, should always be in their mind's eye; then as size was the desideratum they all aimed at, other points being equal, size should count as everything. Hard-and-fast rules should not be framed which would compel judges to unduly appraise any one essential characteristic—for if that were done judging would not only involve vastly more labour, but good judging would be rendered impossible. The characteristics of each class had to be defined and a maximum value fixed to the eardinal points; but what should be considered cardiual points had to be determined according to the par-ticular section under review. To judge a flower for its size, and then to consider its separate qualities, was to judge it twice over. What had to be guarded against was the overpowering importance attached to size; some judges could not get away from size, even when the bloom might be faulty, and he admitted that it required courage to bring a large coarse bloom down to its proper level. Colour and freshness were onom down to its proper lever to closur and treatmess were essentially cardinal points in all flowers, and if these were always accorded their full value, large, coarse, and ungainly blooms would disappear, and without regret, from the show-boards. They might have flowers is large as soup kettles if they could be made so by skilful is large as soup kettles if they could be made so by skilful culture; but they should insist that they should be uniformly good on all points, and as beautiful and perfect as the smallest variety. In defining what should be the essential points of merit, he said the customary maximum number of points given to perfect flowers was six, but these points were calculated by quarters, which gave in reality twenty-four points—thus, if the said one point was to be given to colour it would only obtain the whole of that value when in perfection—it could have a quarter, half, three-quarters, or two whole points as required—maximum points for judging Chrysauthemanns. For Japanese, whatever type when mixed size, including form, troints, colour and freshwhen mixed: Size, including form, 4 points, colour and freshness, 1 each. For the sections of incurved and reflexed, also Japanese incurved and Japanese refleved, when these are judged separately: Size 2 points, form and finish 2 points, colour and freshness 1 each. All the Anomone classes Size 1 point, cushion 2 points, ray florets 1 point, colour and freshness I cach. (Note.—In Pompon Anemones there should be a maximum size.) Hirsute or Hairy Chrysanthemums: Size 2 points, characteristics 2 points, colour and freshness 1 each. Pompons: Size with maximum limit, 2 points, form 2 points, colour and freshness 1 each. Single varieties Size 2 points, with maximum for small varieties, form 2 points, colour and freshness 1 each.

SETTING-UP BLOOMS FOR EXPRISITION, AND THE PRINCIPLES UPON WHICH AN EFFECTIVE ARRANGEMENT OF A STAND IS BASED.

MIL CHAS, E. SHEA (The Elms, Foo's Cray, Kent), read a paper on this subject. He said those who were habitual attendants at our leading Chrysanthemum shows could not fail to be impressed with the fact that there are yet many exhibiters—clever cultivators it might be—who materially injured their prospects of success by faulty setting-up and inharmonious arrangement of their blooms. They might have devoted unremitting attention to the culture of these plants, and with signal success. The blooms were there, and yet at the last moment they deliberately threw away points by defective staging—and points could not be thrown away with impunity in these days of neck-and neck competition. It was, of course, in the amateur section that lack of experience was displayed; but a visit to even that exhibition showed the neglect of the most obvious rules of the staging exhibition flowers. Flatness of staging and absolute ignoring of the primary laws of contrast and harmony of colour were conspicuously displayed even in some of the largest classes. He could not but believe that the hurry and excitement, which were inseparable from competitive exhibitions, tended to relegate to the back ground a matter of the utmost importance. Of the practical importance of good staging there could be no doubt. It was sometimes said that cultiva-tion being the essense of the competition, it was the duty of the judge to base his award solely upon the consideration of the relative excellence of the individual blooms from the the relative excellence of the individual blooms from the cultural standpoint, and that only in the event of an absolute equality of points, ought and could the question of staging come in. Possibly, from a theoretical point of view, that night be so; but instances were not waiting in which such an absolute equality had occurred. But surely this view did not embrace every practical aspect of the matter. In the first place, a flat and badly-staged bloom might not present to the eye of the Judge the bloom in the aspect best calculated to permit of a full appreciation of its true perfec-tion. Again, by inharmonious arrangement of colour, a bloom might seem to have less of brightness of colour that a more suitable contrast and arrange-ment of adjacent blooms would show it to possess. In short, bad staging was just neither to the exhibitor nor to the judge, for it might tend directly to mislead; and even beyond this who could deny that a grandly staged stand had on the mind an influence which created a general bias in favour of that stand. He was convinced that it required a

constant watchfulness on the part of the judge to prevent himself from being swayed by this insidious influence. Before staging it should be made perfectly sure that the plants had been thoroughly examined, and that absolutely every one of the blooms from which the final selection was to be made, had been scrutinised. It should not be discovered made, had been scrutinised. It should not be discovered after the stand had been completed that some other bloom would have been better, as that might result in a re-arrangement of the whole stand. Then the preliminary staging should be done in a place lighted in the same manner, as to top-light, as the place of intended exhibition. The blooms should be firmly fixed in the tubes, which should permit of sufficient elevation, and if possible, just a little forward tilt. The giants should be not in the bloom stage. should be put in the back row and at the ends. In very large classes there might necessarily be some failure of identity of size and weight. In such cases he would advise the strengthening of the back row with the best blooms, which should also be placed at the two ends, and for a row or so in the centre. In the smaller classes no such precaution was in the centre. necessary, for the superabundance of first-class varieties now furnished the exhibitor with a choice so wide that selection from this point of view was needless. If the number of blooms available permitted, all coarse varieties should be excluded. Refinement should be the key-note. In the Japanese classes, the blooms at the end of the stand which were exposed to view should be of a pendulous and drooping character, such as Madame Carnot or Mutual Friend. the same reason, varieties of this character should preponderate in the front row. Of two blooms of the same size —a light and a dark one—the former would look the larger. Therefore, at the important points—the ends—light varieties should prevail. Of course, these considerations are the superior to the course, these considerations are the contractions and the course, the course of the course o tions must be subject, within reason, to the general rules of contrast and harmony of colour. The height of the blooms should be regulated from the front row, taking care that a general level of the blooms be preserved. As to colour and effective arrangement, that exhibition furnished him with many object-lessons of how not to display the blooms to the best advantage, and nothing could be more uninteresting and mawkish than much that be had seen. One aim should be brilliancy of effect by the broad contrast of adjacent blooms. The dark varieties should be dotted here and there with fair regularity throughout the stand. The more bril li int yellows must sparkle here and there, and should not all be crowded into one section. It was well in a large stand, in the crowded into one section. It was well in a large stand, in the first place, to roughly, and subject to alterations, to place these leading bright and striking centrast blooms in positions over the whole board, and then proceed to the filling in of interspaces with varieties of less obtrusive and delicate and tender shades. A great deal of experimental changing would be found necessary, but in practice it would be found a useful start. Whites and yellows would be found very accommodating in their readiness to harmonise with most other colours. Having mentioned a great number of varieties which would make harmonious settings, he said it was, of course, next to impossible to lay down rules which it was, of course, next to impossible to by down rules which would enable a person who had practically no instinctive sense of harmony to deal effectually with the mingling of myriads of subtle shades. To such be would say, cultivate such latent takent as might be in them by studying grand examples of good staging, which never failed to grace our leading shows. There was no difficulty that would not give way before persistent effort. There would be no ultimate failure where the intention to succeed existed.

In the discussion which followed on the two last papers—
The Charketon said the subject of Mr. Shods paper bad

The CHAIRMAN said the subject of Mr. Shea's paper had already been treated by the Royal Horticultural Society, which had drawn up a code of rules. He thought it might be undesirable to disturb that code, except for very good cause; otherwise, the floral world would have two codes to go by.

Mr. Davo thought that if they could agree with the Royal Borticultural Society, their own Society might select portions of the Royal Horticultural Society's code which most suited them.

Mr. W. H. Fownen understood that the Boyal Horticultural Society had already started a code,

The Charryn said that was so, and the Chrysanthemum was included.

Mr. Fowner considered that it would be a pity in that case to have two codes which might clash. That difficulty would not be felt so much in London, where there were so many judges; but it would be felt in many parts of England, where there were so many shows and so few judges. to Mr. Davis's paper, he considered that that gentleman did not, in apportioning points, attach sufficient importance to colour and freshness. He thought judges ought to go for colour and freshness more than for size.

or one in the man in size.

Mr. Davis said he had not seen the Royal Horticultural Society's code, but he had heard that the points laid down as fur as Chrysanthemums were concerned were impracticable. There were too many cardinal points. They wanted a

workable yet simple code

Mr. Gorbox add the Royal Horticultural Society formed a committee which deputed a number of gentlemen to take charge of particular classes of flowers. He was invited to take charge of the Chrysanthemum section, and was instructed to obtain the assistance of gentlemen of authority upon the subject. They had Mr. Jones and Mr. Dean, and four r five others, who were members of the National Chrysanthenum Society, and they endeavoured to prepare a code that should be thoroughly workable, and at the same time simple. they might not have succeeded as they could have wished, but he believed Mr. Davis would find it not quite so elaborate as he had been given to understand. With regard to judging by codes, he might say that he did not consider it

would be possible for a judge to carry that code with bim on the day of the exhibition, and work from it; but he did regard a code, by whatever Society it was formed, to be of very considerab le value if the cultivators would, in the first instance, make themselves familiar with it so as to know what points to aim at. It was a strange thing that a Chryswhat points to aim at. It was a strange thing that a curys-anthemum expert did not begin to recognise the value of a code until he had had some eight orten years' experience of judging. As to judging, he considered that size was of no value whatever unless it was accompanied by other good points, because a flower unless it was fresh and beautiful was, to his mind, obnexious. As to the staging, they had a great deal to learn, and he should be surprised if that exhibition had not given them many an object lesson.

Mr. W. H. LEES said they should go for the beautiful in a flower. After that was obtained, size went to the credit of the cultivator.

Mr. Bevan urged them not to get into opposition wit't the Royal Horticultural Society.

The Chairman assured him there was no thought of any such thing.

Mr. Dean in proposing a vote of thanks to the readers of the supers and the chairman, said the conference had been most instructive and interesting. As to the Royal Horticultural Society, there was a feeling that that society knew more about Orchids than about Chrysanthemunns. They must not forget after all that the National Chrysanthemunn Society was a national society, and, as such, should have a code of its own. He was quite certain such a code would be warmly

own. He was quite certain such a cone would be warmly welcomed throughout the country.

Mr. Witty seconded the motion, which was carried.

Mr. Gordon in reply, said there should be no difficulty in preparing a code of their own. They might do the same as

the National Rose Society did.

The Chairman also replied. He said something had been mentioned about differences with other societies. He thought it just as well for them to have a little difference sometimes, as without it they would lose their individuality as a Chrysanthenium society.

The proceedings then terminated.

ULSTER CHRYSANTHEMUM.

November 10.—The eighth annual show of the above Society was held in the St. George's Market, Belfast, on this date. The plants were arranged on the floor, and small exhibits on tables, thus giving every facility for inspection - 1 should like to see many more large shows have the exhibits arranged in this manner, the plants being more readily scanned, and the effect is better. It is but eight years since this Society held its first show, and year by year the exhibits have increased, and the show of this year may be looked upon as one of the more important held in the country. The show was opened punctually at 1 i.m. by Lady Dufferin, the members of the Society and the general public being present in large

Cut blooms formed a large section, and the Japanese varieties were shown in fine form, for in Ireland, as elsewhere, it has not been a favourable season for the full development of the flower. Incurved were not quite so good as the Japanese being lacking in size, although of good form. The competition is restricted at present to Ireland, but it is, we believe, the intention of the committee to make the competition

Mr H J. Jones, Ryccroft Nursery, Lewisham, S E, had a choice and varied display of Chrysantheniums, for which he was awarded let prize, and a very highly commended certificate. Groups of plants, and plants generally, being numerical rously shown, the competition was keen.

The Veitch Memorial Medal, and prize of £3, were awarded Mr. J. Blakiston-Houston, D.L., Orangefield (gr., Mr. T. GRAY), for the best group of stove and greenhouse plants arranged for effect. The Marchioness of Dufferin, the Countess arranged for effect. The Marchioness of Dufferin, the Countess of Annesley, Mrs. Dunbur-Buller, and the Lady Mayoress adjudicated upon the respective merits of the dinner table decorations. The 1st prize was awarded to Messrs. Thompson & Son, Donegall Place, Belfast. Mr. Wu. Rolfertson, J.P., Netherleigh, won 1st prize for

a group of thirty pots of Chrysanthemuns, and for a group of twenty pots, lst honours went to Mr. Robert Tennent, J.P., Rushpark — Both gentlemen were most successful in a mmber of the other classes for Chrysanthemoms in pots, Mr. R. Tennent, J.P., was 2nd for a group of stove and greenhouse plants, which made a most excellent display.

Mr. J. D. Barbour, D.L., was awarded premier honours for six Cinerarias; and the Marquis of Downshire curied off

the 2nd prize

In Ferns, Mr. R. Tennent, J.P., Mr. W. McCalliand, Lord O'Neill, Mr. J. Lepper, and Major Sharman-Crawford, D.L., were the leading winners. Mr. Robertson was a highly successful competitor in the other classes of plants displayed in this section.

Mr. Thomas Arams carried off all the leading honours in the classes for amateurs who do not keep a gardener.

Freit. Very fine displays of Grapes were those made by the Marquis of Downshire, Lord O'Neill, Lady Howard Bury, Major Sharman-Crawford, and Mr. Wm. Roberton, J.P.

The exhibition of Apples was a highly successful feature of the show, and in the anateur classes a great advance was noticeable upon previous exhibitions. The 1st prize, with which was accompanied the society's Challenge Cup, value ten guineas, with £4 added, for twenty-four dishes of Apples, distinct varieties, was won by Lieutenant-General

PARENHAM, whose display in this, and in other classes, was characterised by a high standard of excellence.

There was a good show of Pears, for which the leading

prizes went to Lord DERAMORE, and Major SUARMAN-CRAWFORD.

Vegetables.—The display of vegetables was above the average in quality, and highly creditable to our northern exhibitors. The entries were very large, and most of our leading growers were represented. In connection with experiments carried ont under the auspices of the Chemico-Agricultural Society of Ulster, there were interesting exhibitions of Potatos by Mr. W. W. DAYIDSON of Brookfield Agricultural School, Moira; and by Mr. W. E. BEST, The Cairn, Aghalee. Mr. DAYID ALLEN, Clonoriol, Strandtown, had an exhibit of twenty-four dishes of Potatos, which included Ochel Gem Seedling, the page readily a Caster Straight. twenty-four dishes of Potatos, which mediumed offer them Seedling, the new seedling Caxton, Satisfaction, Windsor Castle, and other good varieties. Mr. Samuel McCausland exhibited some dishes of the new seedling Potato Lord Dufferin, which will, it is said, produce 20 tons per statute

The Countess of Pembroke succeeded in gaining the three special prizes for incurved, Japanese, and yellow blooms. The arrangements in connection with the show were in every particular of an admirable character, and reflected the utmost credit upon the executive.

The Society entertained the judges and friends, to the number of sixty, at dinner at the Imperial Hotel. The chair was occupied by R. J. Hilton, Esq., J.P., supported by Mr. Dickson of the well-known Rose Nurseries, Belmont.

FOLKESTONE AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 10. - For a new society Folkestone did remark. ably well for this its first venture, getting together a nice -how on the above date. The foyer of the theatre in the pleasure-garden, with a large room at the side, were utilised for the purpose, the groups and plants in pots being in the former, and the cut blooms in the latter. The keepness of competition in some of the leading classes surprised the promoters, and excellent blooms were staged. Altogether, the attempt to add to the winter attractions of this rising watering-place resulted in a complete success, greatly assisted by an afternoon concert given in the theatre on the afternoon of the first day by the Countess of Radnor and her d nighter, Lady Skelsmerdale.

The Brenze Jubilee Medal of the National Chrysanthomum Society was awarded to Mrs. R. C. Kingston, a fine incurved Society was awarded to Mrs. R. C. Kingston, a fine members variety shown in its best character by Mr. J. Buss, Smeeth Nurseries. Kent, a grower who was very successful, as he took the 1st prize for twenty-four blooms, twelve Japanese, and twelve incurved.

Mr. Payni, The Gardens, Elmhirst, Buckley Park, was 1st with twelve Japanese; and Mr. C. J. Bees 1st with twelve incurved.

Mr. Geo. Mount, nurseryman, Folkestone, had the best group arranged for effect, lightly and gracefully set up; Messrs. G. & A. Clark, florists, Dover, were 2nd Plants of Chrysanthennums shown in eighteens, twelves,

and sixes admit of improvement, which will no doubt follow.

Messis, Geo. Benyard & Co., Maidstone, contributed:

collection of 160 dishes of Apples and Pears. Mr. George Mourr also had piles of Cox's Orange Pippin and other leading Apples, alternated with plants; and Mr. Jos. Wilson, Sand-gate Road, Folkestone, a table of floral decorations.

IPSWICH.

NOVEMBER 10, 11. A good show was held in the Public Hall, Ipswich, although in some few classes a falling off was noticeable in the number of the exhibits owing to the date clashing with that of other societies' shows

The group class brought no fewer than six exhibits, and as all of them showed well, the display made was an exceedingly fine one. Mr. W. Adams, gr. to W. J. Catciffols, Eaq., Russell House, Ipswich, was 1st with well-developed blooms; and Mr. H. J. Southgate, gr. to C. Whitfield King, Esq., Morpeth House, Ipswich, came in a good 2nd.

There were but two competitors for a group of Chrysanthemuns and foliage plants, viz., Mr. P. C. Norcerr, Broughton Road Nurseries, Ipswich, who was an easy 1st; and Mr. A. Chenery, gr. to W. Adams, Esq., Chestnut House, Ispwich, who was 2nd.

Mr. Gillert, Floral Nurseries, Ipswich, won the 1st prize or a group of miscellaneous plants arranged as for effect. Mr. Novemer accupying the 2nd place. Both showing very

Cut blooms are much encouraged, the prizes being numerous and enticing. For thirty-six Japanese, distinct, there was but one entry, that of Mr. W. Messenger, gr. to C. H. Berners, Esq., Woolverstone Park, who showed well-coloured examples of some of the leading varieties, especially neteworthy being Miss Maggie Blenkiron, Mrs. C. H. Payne, Elmir de Smith, Edith Tabor, Lord Brooke, Modestum, and Triomphe de St. Laurient.

The competition in the class for twenty-four Japanese was

keener, and here Mr. Notcutt secured the leading place with heavy blooms of high quality, his best being Mrs. C. Blick, Madame Carnot, Niveum and Dorothy Seward.

For twelve Japanese, Mr. W. Adams won easily with fine blooms of Madame Carnot, Edith Tabor, International, M. Pankoneke, &c.

Mr. C. Light, gr. to the Rev. A CECIL JOHNSON, Capel Street, was 1st for Anemone blooms. Mr. Norcutt had the best single-flowered varieties.

Cut flowers, arranged with any kind of foliage, in a space

5 feet by 3 feet, made a great display.

The new usual competition with Chrysanthemum blossoms, cut with long stems, and inserted in vases, formed part of the display.

NORTHAMPTON

NOVEMBER 10, 11.-This Society held its twenty-fifth annual show on Wednesday and Thursday, and although previous exhibitions have been good, this year's eclipsed all previous attempts, both in number of entries and quality of the exhibits. The exhibition reflected much credit upon the Hon. Sec. (Mr. W. Draper), who discharged his duties in a very satisfactory manner.

The following are the chief prize-winners. For the group of Chrysanthemums there were two entries, Mr. Soden 1st,

and Mr. BATEMAN 2nd.

Six Japanese, distinct, not dwarf trained, Mr. GWILLAM 1st, followed closely by Mr. Manning. Four Japanese, distinct, Mr. Gwillam was again placed 1st, Mr. Reeve being Incurved, distinct, dwarf trained, Mr. Manning and Mr. GWILLAM were 1st and 2nd respectively.

Cut Blooms, - Eighteen incurved, distinct, Mr. gr. to Mrs. Phiffs, Collingtree Grange, was 1st; followed by Mr. W. Pearcs, gr. to Mr. G. Loder, Flore House, Weadon.

Twelve incurved, distinct, Mr. Corson was again 1st; and Mr. COLE 2nd

Six incurved, one variety, Mr. Prance showed some grand blooms of Charles Curtis, which clicited a great deal of admiration. Mr. Corson was 2nd, with same variety.

Eighteen Japanese, distinct, Mr. Pearce was 1st, with a good collection of fine, even-sized blooms; Mr. Woods being 2nd.

Twelve Japanese, introduced since 1892. Mr. Pearce was

again 1st, followed by Mr. Cole.

Six Japanese, distinct, introduced in the spring of 1895 and 1896, Mr. Cole was 1st, followed by Mr. W. Pearce.

Six Japanese, one variety, Mr. Woods, Delapré Abhey, Northampton, was 1st, with good blooms of Etoile de Lyon; and Mr. Corson 2nd.

Three Anemone and three reflexed, Mr. Lipler, Mr. Corson, and Mr. Haves were 1st, 2nd, and 3rd respectively
Table of Chrysantheman blooms with Ferns and foliage

plants, Mr. Woods was 1st with a groundwork of Crotons, Ferns, Grevilleas, and Moss, with a few large blooms arranged above the plants; very pretty, but a trifle heavy. Mr. Reeve was 2nd with a table rather weak in blooms, but strong in plants, a nice Cocos Weddelliana in the centre, and small Crotons, Ferns, Palms, Acalypha tricolor; altogether it was a very pretty exhibit. Mr. Kempshall, gr. to Sir Chas. E. Isnam was 3rd. His exhibit was very weak in the centre, and also not enough groundwork.

Primulas were very good For twelve whites grown from seed, supplied by Messrs, Thos. PIRKINS & SONS, Northampton, Mr. HOLLAND was 1st, and followed by Mr. REEVE and Mr. SMITH. For twelve single coloured l'rimulas, Mr. Bate-Mr. SMITH. For twelve single coloured Primulas, Mr. Bateman, gr. to R. L. Bevan, Esq., Brivworth Hall, was 1st with some well grown specimens of "Sutton's Rosy Queen." This is a good variety, and well shown and grown by Mr. Bateman; Mr. Reeve being 2nd

Fruit.-Fruit was shown abundantly in all classes, and competition was keen Black Grapes, two bunches, Mr. ALEXANDRA Was 1st with some well finished bunches of Black Alicante; Mr. HAYES being 2nd with same variety. Whi Grapes were exhibited by Mr. HAYES, and Mr. ALEXANDRA

BRIGHTON AND SUSSEX.

NOVEMBER 10, 11.-Throughout this show the competition was numerous and keen. Indeed, spacious as the accommodation is, there was scarcely passage-room for the visitors, especially between the tables and groups. Groups are always good here, and the competitors threaten to become more numerous than the available space is sufficient for.

throups: For a circular group of Chrysanthemums, aided by other plants, Mr. G. Miles, Dyke Boad Nursery, Brighton, won with a remarkably good arrangement of Palms, Crotons, Ferns, &c. The feature here was some good plants arranged at intervals near the outer circle, and built up to with Asparagns, &c. Mr. Simms, gr. to C. J. Iswood, Esq., The Retreat, Dyke Road, was a good 2nd. For a smaller group, Mr. J. Turner, gr. to Sir G. SMYTHE, Bart., Wick Hall, Hove, won with an equally good arrangement; Mr. F. Rapley, gr. to Miss Visick, Withdeane, following. The 1st prize in both of these classes includes a silver-gilt nedal presented by Mr. Jones, Rycer it Nursery, Lewisham. A grand circular group of Chrysanthemums came from Mr. T. Fairs, gr. to R. Clowes, Esq., Hassocks, who easily excelled Mr. G. MILES in this case

Plants were fairly numerous and good, Mr. J. Hill, gr. to Withdeane; Mr. HILL following. The Silver Medsl of the society was awarded to Mr. Hill.

Flowering plants were good, Mr. M. Tourle, gr. to F BARCHARD, Ess., Horsted Place, won for six well-herried Solanums; Messrs. W. Miles & Co., Hove, for twelve Cyclamen; Mr. J. Benney, Hassocks, was ahead in a strong class of twelve Primulas.

Cut Flowers: Ten competed in a class for thirty-six Japanese varieties for which the President's Silver Challenge Bowl, the National Chrysanthemum Society's Bronze Jubilce Modal and £5 were offered. This was a very keenly contested class; eventually Mr. T. Daney, gr. to E. J. Pope, Esq., St. Leonard's Fyrest, Horshan, was placed lst. This stand contained grand examples of Chorles Davis, Madaine Carnot, Miss D. Shea, Ceel Wray, W. H. Lees, Ialy Love, and Edwin Molyneux. Mr. W. Wallis, gr. to Mrs. Mews, Hartfield, was a capital 2nd, and had good flowers of Viviand Morel, Kentish Yellow, Madaine Carnot, and Mons. Pankoucke.

Seven competed with twenty-four Japanese blooms, and again gave the judges considerable trouble. The 1st prize, and an additional Silver Medal by Mr. H. J. Jones of Lowisham, was secured by Mr. J. Stredwick, Silver Hill, St. Leonards on Sea. Mr. M. Tourle, gr. to F. BARCHARD, Esq., Horsted Place, being a close 2nd.

Mr. J. R. Heasman, gr. to Mrs. Oxter, Fen Place, Turner's Hill, put up a grand box of twelve incurved blooms, the best of which were Lord Alcester, John Lumbert, and Miss M. A. Haggas.

Six collections of twelve Japanese blooms were staged; Mr. P. J. Palmer, gr. to C. E. Legor, Esq., Chichester, winning with good flowers of Good Gracious, Mdlle. M. Hoste, and Mrs. R. J. Hamill among others; Mr. G. Daney, gr. to C. C. Nochols, Esq., Crawley, might well have been placed e pad with Mr. Sayers, gr to the Misses Cook, Nutley, who was placed in front of Mr S Baker, gr. to F H BANESTOLE. Esq., Framfield. These four stands were remarkably close. The best bloom of Hairy Wonder in the show was in Mr. S. BAKER'S hox. Mr. PALMER was also 1st for six incurved varieties; his C. H. Curtis and Lucy Kendall being particularly well finished. Mr. S. Baker, gr. to F. H. BANENDALE, Esq., won for six Lapanese, and had an extra good flower of Mons. Pankoneke

Mr. H. Harris, gr. to Mrs. Eversteed, Denne Park, Horsham, was well ahead for six Anemone flowered, and also for twelve trusses of single varieties.

For six Japanese blooms of any one varie y, Mr. T. Dancy von with Viviand Morel; Mr. A. F. Grace, Steyning, for six yellows, with Golden Wedding; Mr. R. Borrino, Hen-field, with some grand Madame Carnot for six of any white; and Mr. C. Savers, Nutley, for six incurved with Lord Alcester There were from six to ten competitors in each of the above classes

The best basket of Chrysanthemums came from Mr. Docen's Enlay, Portland Lodge, Worthing; and the best dinner-table arrangement from Mr. S. Johnson, Sedenville, Worthing.

Tables of ent Chrysinth muins arranged with amill Forns and other plants, brought out nine lots, the piece of plate going to Mr. M. Standing, gr to Mrs. Joan, Patching, Worthing, for a splendid table, though very little in front of

Mr. H. Hran, The Drive Nursery, Hove.

Four competed for the Brighton Amateur Challenge Trophy and Silver Medal, in addition to money prize was awarded to Mr. J. LILLEY, 32, Cuthbert Road, Brighton after a very close competition all round; this class is limited to growers within a 3 mile redus of the Pavilion. Mr. Than was also 1st for six Japanese and for six incurved varieties. Mr. Harris, Horsham, was 1st for twelve Japanese in the amateur's division.

Fruit: Apples and Grapes were the chief fruits. For three bunches of any white variety, Mr. J. Muddell, gr. to Mrs. Hennerson, Sedgwick Park, Horsham, won with time examples of Muscat of Alexandria. For three bunches of black Grapes, Black Alicante won for Mr. R. Heasman, gr. to Mrs. ONLEY, Turner's Hill.

Mr. G. Goldswith, Horsham, was 1st for dishes of dessert Apples, and for four dishes of culinary varieties. The hest dessert Apples were Cox's Orange Pippin from Mr. J. Sands, Haywards Heath.

The non-competitive exhibits were numerous. Messrs. Laine & Son, Forest Hill; Messrs Cheal & Son, Crawley; and Messes, Balchin & Sons, Brighton, having fruit. Messes. Wells & Co., Earlswood, and Messrs, Cannell & Sons, Swanley, showed specimen blooms and new antheniums; while Mr. J. Battey, East Street, Brighton, had a very pretty group of Orchels and table plants.

BOROUGH OF HANLEY.

November 11, 12.- The fourteenth annual exhibition promoted by this Society was held in the Victoria Hall, Hanley, on the above dates. In the unavoidable absence of the Duchess of Sutherland, the show was opened by the Mayor of Hanley, M. Tunnichiffe, Esq. Compared with former years, this year's show will rank as one of the best yet held by the Society, and is another proof of the present-day popularity of the Chrysanthemum.

Amongst the non-competitive exhibits was a fine collec-

tion of Palms, Ferns, Chrysanthemums, and other plants, exhibited by Mr. J. Kenr, Superintendent of Hanley Park.

Messrs. Clibran & Son, Altrincham, sent single-flowered Chrysanthemums arranged in bunches, which is a good mode of showing these flowers when removed from the plants;

and on the same stand were three dozen specimen blooms of Japanese varieties

Another attractive feature was a collection of sixty dishes of Apples and Pears, shown by Mr. C. Roberts, gr. to C. H.

WRIGHT, Esq., Halston Irall, Oswestry.

The competitive groups and cut blooms were good throughout, and the competition in the various classes was keen.

For group of Chrys in them ums, J. Maddock, Esq., Alsager,

was 1st; and B. B. Nixon, Esq., Leck, 2nd.

For group of plants, arranged for effect, C. S. Jones, Esq., Stoke Villas (gr., Mr. Gibbs), was 1st, whose group contained Dracena Sanderiana, Odontoglossums, Oncidiums, some well-coloured Crotons, and a Cattleya labiate; Bendrobiums, Cocos Wedelliana, Anthurium Andreanum, and exotic Ferns in variety. 2nd, J. Maddock, Esq., with a group containing well-coloured Croton Victoria, C. majestions, C. Mortii, Dra-

c.enas, various Eulalias, &c.

Miss Whitley was 1st for six plants of Japanese varieties of Chrysanthemums.

Foliage plants or Ferns (six) were well shown by T. W. HARRISON, Esq. (gr., Mr. Goodhill), Northwood, Stoke, who was 1st. There were included a fine specimen of Phlebodium aureum, Adiautum trapeziforme, Pandamus Veitehi, Phonix reclinata, and Cocos Wedelliana; C. S. Jones, Esq., was 2nd.

The 1st prize for twelve table plants was taken by M. Hall, Esq., Prestbury.

Cut Flowers.-Mr. ROBURTS, gr., Halston Hall, Oswestry, was 1st for twenty-four incurved varieties, staging fine blooms; and Mr. Bremmell, gr. to H. H. FAUSE HAYIN RST, Esq., was 2nd.

Mr. Roberts was likewise 1st for twenty-four Japanese; Mr. J. McPнад, Queen's Park, Longton, was 2nd, many modern varieties being shown by each.

Mr. H. H. F. HAVIII IST Was 1st for twelve incurved; and C. S. Robert's for twelve Lapanese,

The best box of cut flowers in variety came from Messre JENKINSON & Son, Newcastle-under-Lync.

YARMOUTH.

November 11. This society held it eighth annual cxhibi tion in the Town Hall on Wednesday, November 11. In the quality and number of the exhibits, the show was thought to be superior to any that have preceded it. The specimen plants in pots were perhaps a trille weak, but blooms shown were of excellent character. Interest principally centred around the exhibits of cut flowers from Laptnese varieties. Seven competitors entired the class for thirty-six blooms of distinct varieties, and, eventually, Sor SAVILLE CROSSLEY was awarded 1st prize

TUNBRIDGE WELLS.

NOVEMBLE 11, 12.- This was one of the most successful shows held by this society. Fruit and vegetables were extra good and numerous; white the cut-blooms of Chrysanthemums were excellent

The best group of Chrysanthemums came from Mr. Smooker, gr. to Mrs. HALL, Broadwater Down; a neous group winning in another class for Mr. J. Howes, gr to W. Cobb, Esq., Broadwater Down.

For twenty-four cut flowers, incurved, Mr. J. Howes led with a superb lot of blooms; also for twelve and for six incurved blooms Mr. J. Snow, The Gardens, Walhurst Park, won for twenty-four Japanese and for twelve blooms, followed by Mr. Howes. Mr. J. Moss, Matfield, led for six Japanese blooms distinct; and for six blooms of any one variety, followed by Mr. J. Snow in each case.

Primulas, table-plants, and Solanums, were good. Special

mention must be made of some Poinsettias from Mr. Austlu, gr. to F. Webb, Esq., Broadwater Down, whose six plants in 6-inch pots curried no fewer than twenty-eight bracts, the majority of which were 45 inches in diameter. One plant, carrying half-a-dozen bracts, was nine years old, and did not stand more than 3 feet high.

Find was very good. The best black Grapes were three bunches of black Alicante (8 lb.) from Mr. J. Palmer, gr. to H. J. METCALF, Esq., Southborough - these were e

itionally well finished.

Mr. F. Bridger, The Gardens, Penshurst, had the best dessert Pears, and culinary and dessert Apples.

Vigetables were exceptionally fine. A collection of twelve kinds gave much trouble to the judges, but eventually Mr. J W. Moss, Matfield, was awarded the premier prize; and Mr. J. Snow 1st for nine kinds in a special class offered by Mr. J. CHARLEON, nurseryman, Tunbridge Wells, who had by far the best trade exhibit in some grand vegetables and farm

LEWES.

NOVEMBER 11, 12, - A very creditable exhibition was held here. The blooms and plants were good, but not so mimerous as usual. Vegetables were carital.

For the best group of Chrysanthemum plants, Mr. C. Funnell, gr. to Mrs. Thorne, Louthover Grange, Lewes, was 1st, and took the Bronze Jubilee Medal of the National Chrysanthemum Society. The best group of stove and greenhouse plants was a pretty arrangement from Mr. J. Adams, gr. to the Rev. Sir G. SHIFFNER, Bart., Coombe Place, Lewes, Mr. E. Stidworthy, gr. to J. AFAMES, Esq., Lewes, had a fine lot of untrained plants, winning in a class for twelve, and receiving the National Chrysanthemum Society's Certificate

Primulas were good and numerous. For six singles, Mr. J Harwood, gr. to A. J. Jack, Esq., Scaford, was most successful. Mr. S. Smith, gr. to C. R. Kemr, Esq., Bedford Lodge, Lewes, won in a special class for six singles, and alse for six double varieties. Mr. J. Adams, gr. to Rev. Sir G. Shiffener, Bart., had the best six table plants; and Mr. C. Watkins, gr. to W. L. Christie, Esq., Glyndebourne, the best six Cyclamens.

Cut Flowers.—There was strong competition in the class for twenty-four Japanese, Mr. J. Harwood, gr. to A. J. Jack, Esq., The Cronch, Scaford, won from Mr. A. Slaughter, Steyning. There were some magnificent flowers in these stands. Mr. C. Sayers, gr. to the Misses Cook, Nutley, was ahead for twenty-four incurred blooms, showing in grand form; Mr. J. HOPKINS, High Cross, Framfield, 2nd. Mr. C. SAYERS also won for twelve incurved, for six incurved, and for six incurved of one variety. Mr. J. Coles, gr. to H. F. WALKER, Esq., Balcombe, won for twelve Japanese blooms, for six blooms, and for six blooms of any one variety. From six to ten competitors staged in each of these classes.

Fruit and Vegetables.-The best three bunches of Grapes eame from Mr. E. Stidworthy, gr. to J. Adames, Esq., Lewes, Black Alicante being the variety. Mr. F. W. Thomas, Wan-nock Gardens, Polegate, won for three dishes of dessert Apples, and also for three dishes of culinary varieties. Apples were numerous and good. Mr. J. HORKINS, Framfield, won for three dishes of dessert Pears.

Out of nine trays of vegetables, Mr. R. Whearly, East Gate Street, was 1st. Mr. M. Toulle, gr. to F. Barchard, Esq . Little Horsted, winning in a very close competition for Messrs SUTTON & SONS' Special Prize.

HULL AND EAST RIDING.

November 11, 12.-As on former occasions, this exhibition was held in the capacious Artillery Barracks. Unlike many other societies, the executive of this show rely chiefly upon the Chrysanthemum to make the display, and no fruit or vegetables are encouraged. This is wise, for there is now a comfortable promenade, and the opportunities are good for inspecting the exhibits. Messrs, Edward Harland and James Dixon are the Hon Secretaries, and every assistance is given by them to exhibitors.

Groups. For several years past this show has been famous Groups. For several years past this snow has been ramous for the excellence of the groups arranged for effect. In order to put all exhibitors in the group classes upon an equality, the plan of the groups is drawn to scale, and issued with the schedule, a novel and capital idea. The space allowed in the large class for Chrysanthemums is 8 feet by 14 feet, the front part being two semi-circles. The competition in this class is always know between three or four petition in this class is always keen between three or four well-known exhibitors.

On the present occasion the 1st prize, a Silver Challenge Vase of the value of 20 guineas, and a cash prize, was won by Mr. G. Jarvis, gr to Mrs. WHITAKER, Cliffe House, Hessle. The chief points of this group were effective arrangement, combined with well-cultivated plants; Mr. G. COTTAN, Alma Gardens, Cottingham, was a close 2nd, with an imposing display, the finish in the front being very free and effective, but the back not so good towards the centre, where a good Palm would have been an advantage; otherwise it showed good culture and effect.

In comparison with other exhibits in this class, the group

staged by the Corporation of Hull through its gardener was best in point of collective merit, but no prize could be awarded to it. The flowers were of excellent quality and the arrangement good.

For a group of miscellaneous plants arranged for effect in a space of 100 square feet in the form of a square, with the sides somewhat recessed, the plants to face all ways, the 1st prize was won somewhat easily by Mr. Moody, gr. to F. F. Blados, Esq., Sutton-on-Holl. The chief dot plants were tall ones of narrow-leaved Crotons, well clothed with foliage to the pots, and upon single stems, the colouring being good: foliage Begonias told well in the ground-work, and so did Phrynium variegatum; around the centre Croton some plants of Cattleya labiata. The 2nd prize in this class was awarded to Mr. G. Jarvis, his arrangement being heavier, but effected with good material, comprising two well-flowered plants of Eucharis grandiflora, which did not balance well with those of Cyanophyllum magnificum; some Cattley s and Oncidums were used effectively around the centre.

In another class, and a very instructive one at this season when indoor decorations are frequently required viz., a when major accorations are frequently required viz., a drawing room mirror or panel group of Chrysanthemunns, interspersed with foliage plants in a space of 9 square feet, a mirror 3 feet by 6 feet being provided, the 1st prize was awarded to Mr. G. C. Coates, gr. to W. Wheatley, Esq., Anlaby Road, whose arrangement was light, cheerful, and effective the signal of the prize and the signal of the content of the signal o effective, the irror not being hidden, the grouping being kept low. Mr. G. Cottam followed very closely, he depending upon large blooms of Japanese chiefly, with very suitable foliage, including Cissus discolor, for entwining around the margin of the mirror.

Specimen Plants.-The competition in these classes, of which there were twelve, was spirited — For three trained specimens (standards excluded) Mr. C. J. Ringnose, The Grange, Cottingham, was placed 1st, his plants being of excellent quality, of medium size, and fresh. Colonel A. K. Dien, Kirk Ella, was a good 2nd.

For three trained standards, Colonel A. K. Dies easily won

with well-flowered plants of the Rundle family, bearing large blooms; Mr. Ringrose was in this case a rather poor 2nd,

In the next class, that for six plants bush grown but not formally trained, Mr FRED PAPE, Butcher Row, Beverley, was the winner of the 1st prize, showing large, well-flowered plants, chiefly of Japanese varieties, which were bearing remarkably good blooms.

The next, and an excellent class, was that for six plants, "cut backs," good cultivation to be the leading feature. Mr. E. West, The Nurseries, Cettingham, was 1st, a close competition, his tinest plants being Viviand Morel and Florence Davis, both of which bore very finely-developed flowers.

In the classes confined strictly to amateurs, the most successful exhibitors were Mr. W. Higgins, Queen's Road, Hull; and Mr. F. PAPE.

Cut Flowers.-In the class for twenty-four blooms, incurved, in not fewer than eighteen varieties, and not more than two of one variety, the Silver Cup and prize of £10 was awarded to Mr. W. Mease, gr. to A. Tate, Esq., Downside, Leather-head, whose stand contained a remarkably even lot of head, whose stand contained a remarkanty even for of blooms, bright in colour, of full size, and of perfect form, the finest being Golden Empress, R. Cannell, Lord Alcester, C. II. Curtis, Empress of India, W. Tunnington, and C. B. Whitnall; of these, Lord Alcester was selected as the champion incurved bloom of the show. This collection was thought in the index to the label. thought by the judges to be the best twenty-four incurved blooms yet staged this year. The 2nd prize was worthily taken by Mr. J. P. Leadbetter, gi. to A Wilson, Esq., Tranby Croft, Hull.

Tranby Croft, Hull.

In the corresponding class for twenty-four Japanese distinct, a Silver Cup and £10 was again awarded to Mr Merver, who won somewhat easily, the blooms being altogether brighter and fresher; the following were all grand blooms, John Seward, Golden Gate, Oceana, Mutual Friend, Modestum, Hairy Wonder, and Western King. The 2nd page was awarded to Messre J. R. Pearson & Sons, the best here were Edith Tabor, Miss M. Blenkiron, Pride of Madford, Oceana, and M. Demay Taillandier.

For two baskets or vases of cut Chrysanthemmus, each containing twelve blooms distinct, one basket of Japanese.

containing twelve blooms distinct, one basket of Japanese, and the other of incurved blooms, arranged for effect, with any kind of cut fobage, quality, too, being a leading feature, Mr. G. Wilson, gr. to Sir James Revert, Bart., Swandand Manor, Brough, was worthily awarded the 1st prize, the arrangement being most excellent, the blending of suitable foliage being quite in accord with the superb exhibition quality of the blooms; bronzes, yellows, and whites, prevailed in the best kinds, the foliage of the Mahonia aquiexcellent taste. Mr. G. Jarvis, gr. to Mrs. WHITAKIR, Cliff House, Hessle, was a good 2nd, with a somewhat similar but less imposing exhibit.

The best slx blooms of any one variety of Japanese were those of Viviand Morel, shown by Mr. G. Picker, gr. to F. R. Peake, Esq., Hesslewood, Hull, these being of deep colour and perfect finish.

The best twelve large flowered Anemones in not fewer thau The best tweive large Towered Anemones in not lewer that six varieties, were those shown by Mr. G. Burrows, gr. to Miss Bennert, Westlands, Grimsby, who had very fine and well-developed flowers of Miss Annic Lowe, John Bunyan, Queen Elizabeth, Descartes, and Delaware. Mr. Mason, gr. to A. Smith, Esq., Woodleigh, Hessle, came a close 2nd.
For twelve blooms of reflexed, not fewer than six varieties

Mr. Mease won again with fine blooms, of which cloth of Gold, Cullingfordi, Christine, and Mrs. Forsyth were best; the 2nd prize going to Mr. Walker, gr. to Colonel CLITHEROE, Hotham Hall, Brough.

In the class for twelve bunches, Pompons, Mr. W. Sinclair, gr. to B. Mackhell, Esq., Thwaite, Cottingham, whose exhibit was set up in an informal manner, with good length of stem, the best kinds being White Mdlle, Marthe and Mrs. Pateman; Mr R. Walken was 2nd again in this class, his flowers being too much packed together.

For twelve singles in not fewer than six varieties, Mr. Sixchair was let once more, with a beautiful stand, set up in similar style, the best were Miss Cannell, Miss Sarah, Mary Anderson, and Souvenir de Londres. Mr. WALKER was 2nd, but again too much packed (a very strong class).

The best hand bouquet in the open class was shown by

Mr. H. H. Tavifr, Newland, a combination of yellow and bronze; the next being shown by Miss Taylor, in which yellow predominated; and the best epergne for the dinner-table came from Mr G Wilson, gr. to Sir James Reckett, Swanland Manor This was not strictly an epergne as per schedule, due regard to which is absolutely necessary.

A very fine class, as a rule, is that for a table of Chrys-anthemums, exhibition cut-blooms, any types, to be shown in anyway the exhibitor thinks best, appropriate foliage being allowed, the table space 12 feet by I feet. Mr. Mason was on this occasion awarded the 2nd prize, some weakness being apparent in the quality of the blooms, the arrangement on the other hand was commendable; the champion Japanese bloom was how ever found here in Madame Carnot,

In the classes open to the East Riding of Yorkshire, and that part of Lincolnshre within 20 miles of Hull, the competition was very close, and the classes well supported.

For twelve incurved in this section, Mr. R. WALKER showed strongly, and obtained 1st prize, which also carried with it the National Chrysanthenum Society's Silver-gilt

For twelve Japanese, Mr. J. W. BACKHOTSE, Beverley, was easily 1st, having grand flowers of Duke of York, Thos. Wilkins, Madame Carnot, and G. C. Schwabe, amongst

Decorative Classes (apen to Ladies only) are a perpetual source of attraction at Hull, these being all exhibited in artificial light. In the first and most important of these classes, viz., that for a dessert table 8 feet by 4 feet, decorated with

Chrysanthemums only, fruit however being allowed, Mrs. H.L. LEGNARD, Preston, Hull, was awarded the 1st prize consistthis table was chiefly composed of Source d'Or, Chrysanthermum and snitable foliage, the centre stand being a most tasteful exhibit. This table was an appropriate one for the season of the year, the colonis warm, but not at all overdone. The 2nd prize was awarded to Mrs. F. Торнам, Hotham Hall, Brough, whose table was composed of entirely white Chrys-

brough, whose table was composed of entirely white Chrys-antheniums and light green foliage.

The best bouquet was shown by Mrs. Mackrill, and the best sprays by Mrs. F. W. Jameson, Runswick Honse, whose designs were quite informal, and most tasteful. Mrs. H. L. Leonard had by far the best epergne.

In a class for the best tasteful arrangemement of cut Chrysanthemums or other flowers, Miss Lynette Harland, Wolfreton Lodge, Kirk Ella, was 1st, her arrangement being bold and original—the latter always a good point when effect is not sacrificed.

CARDIFF.

NOVEMBER 11, 12. - The Cardiff Society's show for the advancement of the cultivation of the Chrysanthemum, held in the Park Hall, was in every respect a successful one, the exhibits effectively arranged, and generally of high class.

Cut blooms were never better shown, and the trained plants and groups were remarkable for effectiveness, and the good quality that characterised them. The competition in good quarry that characterised them. The competition in those classes was severe, and the chief awards were about equally divided between Messrs, W. TRESEDER, A. E. PRICE, and CASE BROTHERS, all of Cardiff. The latter had a large screen of virgin-cork in front of the orchestra, decorated with bouquets, wreaths, &c., which were apparently much admired by the ladies,

Groups of miscellaneous plants, table decorative plants, and Ferns were attractive features. Good collections of Apples came from Messrs. Watkins, Pomena Farm, Hereford; J. Basham, Bassaleg, Newport; Clibran & Sons, Altriheham; and PITT, Abergavenny.

The classes for collections of fruit and Grapes were not numerous. Mr. Grindrod, gr., to P. T. Phillips, Esq., Whitfield, Hereford, was 1st, with a good collection, as he was likewise for Black Grapes, with splendid Gres Colman. Mr. W. S. Williams, Glyn Neath, was 1st for Muscat of Alexabelria, with well coloured medium-sized bunches.

Cut blooms.-The 1st prize for twenty-four Japanese Chrysanthemums, distinct, was taken by Mr. J. Howe, gr. to T. J. M. VSFFRS, Esq., Lanslay, Llantrisant, with a beautiful lot. many novelties of the year being amongst them.

The variety Oceana in this stand won the National Chrysanthemous Society's Certificate as being the best bloom in the show; Mt. Robinson, gr. to R. W. D. HARLEY, Esq., Brampton Brian, was a close 2nd with fine blooms, although there were six entries in this class, and all good

Twenty four incurved, distinct: 1st, Mr. Dumble, gr. to Sir C. Phillips, Picton Castle, Haverfordwest, was the winner in this class with spleudidly finished blooms. There

winder in this class with splendary infished flooms. There were five exhibitors in this class,

Twelve Japanese: 1st, Mrs. Liewellyn, Raglan Hall,
Briton Ferry (gr., Mr. Gilbert), having good blooms of leading varieties, and some novelties; 2nd, Mr. Howe. There were nine entered.

For twelve incurved, Mr. Robinson was 1st; and Mr. Howe 2nd.

Six Japanese, sent out during 1895 and 1896,-1st, Mr. G. W. DRAKE, nurseryman, Cardiff, with Mrs. Hume Long, Edith Tabor, Vicar of Exmouth, Pride of Exmouth, Arona, and Mrs. Peter Servator.

A Challenge Cup was offered for twelve Japanese and twelve incurved blooms, distinct, the conditions being that one exhibitor must win it twice before it becomes his property. Last year it was won by Mr. Robinson, gr. to R. W. D. Harley, Esq. There were six exhibitors, but the contest really by between Mr. Denble and Mr. Robinson, the former having the best incurveds, although his Japanese were not leaving the oest incurveds, atthough his Japanese were not leaving to those of his rival. The splendid lot of incurveds, however, secured for Mr. Dunble the ceveted prize for this year. His best blooms were Chas. Curtis, Prince Alfred, Mrs. Heal, Brookleigh Gem, Miss Haggas, Golden Empress, and Mr. J. Kearn.

WESTON-SUPER-MARE.

NOVEMBER 12.—This show was held on Thursday, at the Victoria Hall, and was a great success. There were nearly forty classes, and although some were not so well filled as formerly, others made up for the deficiency; as regards quality all the classes showed a marked improvement. The features of the show were the Chrysanthemum banks, the trained plants, and the collections of flowering and foliage

For four Chrysanthemums, large-flowered incurved, distinct varieties (Japanese excluded), some grand plants were shown, the 1st honours being obtained by Mr. W. Brooks, shown, the 1st honours being obtained by Mr. W. Brooks, of the White-Cross Nurseries, Weston-super Mare; the plants grown by him were of the usual varieties, one, Baron Hirsch, gaining the certificate "Best incurved plant in the show," These plants were all about 6 feet through, and were just right for exhibition. The 2nd prize was awarded to Mr. Ash, gr. to Mr. Holland, with four plants considerably smaller, but carefully trained, and neat in appearance,

Four ditto, untrained plants. This class was well filled, Mr. C. Pethick (gr., Mr. Summerhayes) obtaining premier

The prize-winners in the class for four Japanese, distinct, one stem, trained, were a magnificent lot. The varieties were W. Tricker, Volunteer, Col. W. B. Smith, and Beauty of Exmonth. Col. W. B. Smith was awarded the Certificate as the best Jspanese plant in the show. In the untrained class, Mr. Pethick was spain successful.

The Trophy, a silver-plated candelbrum, value 28 guineas, has to be won twice in succession, or three times in all, and this year Mr. Brooks won it for the second time in succes-sion, thus securing it ontright. The standards shown were of exceptionally good quality, and close competition resulted in Mr. W. Bnooks securing 1st, and Mrs. Campbell 2nd prize.

For the largest and best-grown Chrysanthemum, a Glenny," shown by Mr. W. Brooks, was successful. class for the best group of Chrysanthemums, the keenest competition was shown, no fewer than eight banks being staged. Here Mr. Pethick was 1st, and Mr. W. Brooks 2nd. The effect of the banks was charming, and some fine blooms were noticeable on the plants.

In the six stove and hot house plants class (Ferns admissible), a creditable display was made. The 1st prize went to Mr. W. Brooks, who showed several fine Tree-Ferns. The remaining class for plants—a collection arranged on stage aroused great interest, and some beautiful plants were shown. The bank winning the 1st prize, shown by Mr. W. Brooks, consisted of Dendrobium Phakenopsis Schröderianum, Onci-dium varicosum Rogersii, Odontoglossum crispum, Cattleya labiata, C. Mendeli, C. Bowringiana, Cypripedium Spicer-ianun, C. insigne, O. Pescutorci, Lycaste Skinneri, Lacha Perrini, Calanthe Veitchii, &c. Besides these, Caladiums Gabrielle, Ville de Hamburgh, Madame Milgani, candida, Gabrielle, Ville de Hamburgh, Madame Milgani, eandida, Luddemanni, &c., were shown, and Camellias, Roman Hya-cinths, Carnations Miss Joliffe, Winter Cheer, Alice Hayes, Cocos Weddelliana, Kentia Fosteriana, &c.: Croton3, Ferns and many others. The 2nd prize went to Mr. H Permi & The zonal Pelargoniums staged were very good, and included several new varieties. The cut blooms was not up to the standard of last year, but still they were good. The

Japanese Chrysanthemmas were better than the incurved. In the class for twenty-four incurved blooms in not fewer than eighteen varieties, Mr. J. Bishor, Taunton, was awarded 1st prize. A fine bloom of Empress of India secured the Certificate for the "best incurved bloom in the show,

In the twelve (distinct varieties) incurved class, Mr. J. Brain, Stoke Bishop, was successful. Some fine flowers were in the six incurved class, and the competition was very keen. Mr. J. Bayliss, of Winterbourne, took 1st honours Mrs. Beddoes (Easton in Gordano) was the winner of the 1st prize in the Japanese class for twenty-four blooms, and the Certificate for the best bloom was awarded her for a fine specimen of Robt. Owen. Mr. Tode was the winner in the twelve blooms class; and for six blooms, Mr. J. Doll, Bristol, secured premier honours. As usual, in the latter class there were a large number of entrants.

A variety of subjects were shown beyond those mentioned in our report, including some very good examples of the bouquetists art, bothouse and hardy fruit - these last in small amount, and, taken as a whole, the show was one very creditable to the amateurs and gardeners of the locality.

PUTNEY, WANDSWORTH, AND DISTRICT.

November 12, 13.—The nineteenth annual exhibition of the above Society was held in the Cromwell Hall, Putney, and was in every respect a success. The number of entries was in excess of last year, and keen competition was overywhere evident. Several fresh classes being this year added for the first time, attracted the attention of a great many competitors. Japanese blooms were, as usual, this season in good form; Mr. James Ross, gr. to J. W. CHARRING-Tox, Esq., Gifford House, secured the 1st prize in the class for twenty-four; while Mr. J. Wright, gr. to H. A. TAF-NELL, Esq., The Grove, was 1st in the class for twelve. And Mr. J. Dirk, gr. to J. Hooker, Esq., was a capital 1st in the class for twelve cut blooms allotted to single-handed gardeners.

The incurved section here as in common with other shows was not up to the usual standard. James Ross was again 1st in the premier class, while Mr. Pourners was a very close 2nd. The former exhibitor was also deservedly placed 1st for six table plants—The Silver Cup, the coveted prize of the show, was won by Mr. S. Mynett, gr. to S. Carlisle, Esq. Ashburton House, who staged in his usual style; while the prize for the best cighteen Chrysanthemums (open to amateurs) was awarded to A. Lass, Esq. Mr. Chas. Bentley, gr. to Major Bosworth, Ce'ar Court, took the chief honours in trained specimens.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL.

NOVEMBER 12, 13. - The show held on the above dates was not so strong in some things, still, on the whole, it was an improvement on some former years.

At the entrunce to the hall stood a pyramid about 15 feet high, of fine specimens of Palms and other foliage plants, standing on a basis garnished with Celery, large Onions, Tomatos, &c., the exhibit of the Coldustin Guano Co Inside the hall, all around the sides, were well ornamented with nurserymens' exhibits. Messrs, Smith & Simons exhibited a grand collection of Potatos, Snowdrop, Scottish Triumph, Satisfaction, Duke of York, and H. M. Stanley, were conspicuous varieties. These were backed with Eugas, Lily of the Valley, Cyclamens, Roman Hyacinths, and other flowering plants. Austin & McAslan had a capital table of Chrysanthemum blooms, with an adjunct from Mr Jones, Lewisham, in which were mmy of that eclebrated growers choicest flowers.

Messrs. Brown & Sons, Glasgow, were strong in Grapes, Apples, and Tomatos. Mr. Kippen's display was much admired. Tomatos and Gros Colman Grapes were also fairly represented by Messrs, Buchanan, Cunningham & Wyllie, Glasgow, exhibiting their choice flowering and foliage plants also a collection of Potatos - Tables of plants for competi-tion took up large space, and were finer than usual - Chrysanthemonos interspersed with fine-foliaged plants is the

arrangement specified.

The 1st prize out of five exhibits went to Mr. Dan, gr. Aitkenhead: Mr. Architecto, gr., Bothwell Castle, was a capital 2nd; Mr. Teyror, gr., Blackdale, 3rd A small table of Orchids were shown, and a 1st prize for

Cottleya labiata was awarded to Mr. Mitchell, Bartaskin.

Chrysouthemams. The 1st prize for thirty-six blooms of Japanese Chrysanthennums, was won by Mr. Levi, gr., Keir, with one of the first chibits ever seen in the North. Thirty-six varieties had to be tabled, and these were in every instance fresh, handsome, and very fully developed. Mr. W. H. Lees was an extra fine bloom, and was awarded 1st prize as being the finest in the show, Louise, Tricker, Sunflower, Princess May, Lilian B Bird, Duke of York, Mutual Friend, Rose Wynne, Viviand Morel, and M. Hoste were extra fine blooms. Mr. Day, Galloway House made a good 2nd

Mr Laxi took the level also with twenty four Japanese, in eighteen varieties, with an exhibit as fine in quality as his larger one. Mr. Aprilson, gl., Blackhouse, Ske'morlie. was 2nd

was 2nd — For twelve blooms Japanese, and twelve of incurveds, Mr. Day took 1st prize, with a time exhibit; Mr. Dati, gr. Aitkenhead, was 2nd — For twelve Japanese blooms distinct, Mr. Lt 8) was igain 1st

The smaller classes were well represented. The bunch s of single-flowered Chrysantheniums, three of cach, exhibited in glasses, filled a goodly space, forming a nice show, that met with much admiration.

Fract. Grapes of fine quality came from Mr. Lescie, Pit-cullen, Perth, and were much above the average in quality. His four bunches of Museats and tiros Colman were large in bunch and berry; Black Alicante were equally 2001; and Mr.

Officer and Derry; Black Advante were equally 2004; and Mr. CAMBRON, gr., Auchterarder House, was 2nd.

Mr. Lest D. was 1st for two bunches of Micinte, excellent in every respect. Mr. Ormston, gr., Milken House, was 1st for good Lady Downes. Other exhibits of this excellent variety were likewise very good.

For two bunches of times Colman, Mr. Lestie was 1st with two grand bunches; and Mr. Mitts, Wishaw, was 2nd

Muse it of Alexandria is seldent seen in finer condition at any show than the pair of bunches with which Mi. Lestie took the 1st prize in that preserved Duke of Buccley h in that does Mr. Atsus had well

Apples and Pours were shown by Mr. Day and Mr.

 $\begin{array}{lll} \textit{Prophable} i + \text{In} & \text{the vegetible classes there were some} \\ \text{etraordinary Lecks} & \text{Celery was not equal to some seasons} \end{array}$ produce; Tomatos were manerous, but past their best. The collection of twelve dishes of vegetables from Mr. Brown, gr., Houston, was as near perfection, for general excellence as Househ, was as it at perfection, or sensing exercise, as we are likely to see-Leek The Lyon; Cehry M yor Clarke, Carrot Veitch's Extra; Onion Cranston's; Brussels Sprouts, French Beans, and Potatos, were all excellent.

SHEFFIELD.

NOVEMBER 13, 14.-This excellent exhibition was held in the Corn Exchange on the above dates, and so much above the average were the exhibits generally, that comparison with the Aquarium Show of the National Chrys inthemum

with the Aquarium Show of the National Chrys inthemum Society were not unheard from very competent judges. Comparing the quality of the exhibits with previous years—and that is the only standard justifiable—the blooms on exhibition were, many of them, superior to last year.

The groups, not shown solidly, but with a pleasing admixture of preen, were very excellent. Mr H M, Willford of Walkley, had i fine group in the district class, for which he was awarded list prize, and, in addition, secured a special Medal, presented by Mr. H. J. Jones of Ryceroft Nurseries, Lewisham.

In the amateurs' and cottagers', Mr. B. Glossop secured the prize and Medal for the group.

Open Classes—Chrysanthematus; Cut flowers twenty four

Open Classes - Chrysanthemams: Cut flowers, twenty four open Classes,—Chrysanthenaums: Out flowers, twenty four incurved blooms, not less than eighteen varieties: 1st, J. H. Gooda Ry, Elyaston Castle, Derby, some of the finer blooms being Madame Carnot, Phoebus, Duke of York, Niveum, Etoile de Lyon, Miss Elsie Teichmann, Madame Rozain, Mutual Friend, Mrs. H. Payne, Thos. Wilkins, Primrose League, Miss Rita Schroeter, Mrs. W. H. Lees (splendid), and Chas. Davis, Twenty-four Japanese blooms, not fewer those interventions. and Chas Davis. Twenty-four Japanese blooms, not rewer than eighteen varieties: 1st. C. CROOKS; 2nd. J. R. PEARSON & Sons. Twelve incurved blooms: 1st. C. CROOKS. Twelve Japanese blooms: 1st. C. CROOKS. Six incurved blooms: 1st. C. CROOKS. Six incurved blooms: 1st. C. CROOKS. Six Aneumone blooms: 1st. G. Stables, gr. to Mrs. Warf. Object thorpe House. Six reflexed blooms: 1st. C. Scott.

District Class. Plants teroms of Chrysanthemum, inter Special views. Tames of one of mysanthemme, inco-special with foliage plants, arranged for effect: 1st prize, and Medal, M. H. Willford; 2nd, T. Morton, gr. to Mr. J. G. Lowood. Six Chrysanthemums, trained specimens, large flowering: 1st, U. Scott, gr. to Mr. J. Colley; 2nd, R. Agar, gr. to Mr. S. Roblers. Group of British Ferns, twenty-four varieties: 1st, J. Eadon; 2nd, W. Smith. Six exotic Ferns; 1st, R. Agar. Group of Prinulas; 1st, C. Scott Six plants for dinner table decoration: 1st, T. Mortos.

NORTH OF SCOTLAND ROOT, FRUIT, AND VEGETABLE ASSOCIATION.

November 1: The annual show of this association was held on Saturday, at Inverture, N.B. The entries, which numbered 700, were in excess of those of last year, and there was admittedly a fine display of field and gardon produce.

There was a fine display of Potatos, which was a feature in

this section, and the excellence of the variety Grampian, was well shown. The Rosebery was also well shown, but the Champions, owing to the character of the season, were not quite so good as usual. Mr PAIRESON, Drummahoy, wen the Silver Cup for the best sample in the show with a dish of Snowdrops. In the section of garden Potatos, the Standard variety was the best among the round whites, but while almost perfect as a show Potato, its quality is not considered first class. In the round coloured class, Rosebery took the first class. In the round coloured class, rosenery toos are premier place, the Grampian making a good 2nd. Perkins' Snowdrop carried everything before it in the long white section, Mr. Großge Pathkon, Torries, carrying off the plate with a remarkably fine sample of this variety. It omes early to maturity, and was seen to better advantage than some of the later sorts, which had suffered from disease. Prizetaker was a feature of the long coloured Plottes, this being a tuber with a good reputation as a cropper, as well as for the table and exhibition. The only croper, as well as for the table and exhibition. The only stricty that came near the Snowdrop was the Standard, but it was beaten on the score of quality. In the other variety class, the Up-to-date Polato, which has been brought into prominence lately by producing at Lord Rosebery's Scottish scat, Dalmeny, a crop of twenty five tons per acre, was the most conspicuous dish. Other notable samples in the hall were Recorder and Sutton's Abundance.

Fruit was seen to great advantage, Apples being above the ordinary standard.

Vegetables were remarkably fine, Unions and Leeks being pronounced by the Judges to be the linest ever exhibited at

EVESHAM.

November 11. The Eyesham Chrysanthemum Society held its annual exhibition in the Town Hall on the above date. Groups of plants arranged for effect were well shown, while specimen plint as here catered for, are strongly shown, not in severely-trained shapes, but as nice, naturallygrown plants, bearing from twelve to thirty or more good blooms. Unt blooms of Japanese varieties are also a strong feature, and on the present occasion the leading stands of flowers were equal in merit to those usually found in large ind important exhibitions

troups and Plante. For a group of thrysonthemums to occupy a space of 40 square teet, Mr. Martin, gr. to Miss G. B. RLINGHAM, Lansdownic House, Evesham, was 1st, with a very creditable collection of dwarf plants, bearing flowers of good quality, remarkably bright and fresh; 2nd, Mr. Clarke,

good quality, remarkably bright and fresh; 2nd, Mr. Clarke, gr. to J. H. Litgh, Esq., Hill Crest, Evesham.

In class 2, comprising Chrysanthemums and foliage plants arranged for effect, Mr. Harrison, gr to J. Morris, 1sq., Evesham, was 1st; Mr. Marris, 2nd. Mr. Harrison was also 1st for three specimen plants, with Marie Hoste, Florence Davis, and Mrs. Forsyth; 2nd, Mr. Clarke. Classes for standard and pyramidal-grown plants brought good competition. (If the femory Mr. Marrison, besides givining the petition. Of the former, Mr. Harrisox, besides winning the 1st prize in its class, was awarded the National Chrysanthe-mum Society's Certificate for the best plant in the show, with a fine standard of Ville, Blanche Pigny.

Cut blooms were well shown. For eighteen Japanese, fr. G. Wills, Bengeworth, Evesham, secured the 1st award, with one flowers, admirably set up and named, an object-lesson for some exhibitors in the same class. Among his best were Madame Carnot, Richard Dean, Thos. Wilkins, Rose Wynne, M. C. de Leché, and Ad. Grond.

With twelve J quanese, Mr. Witts scored another easy victors, Phobas, Australie, Madame Carnot, Melle M. A de Galbert, and Chas Divis, with others very fine. Some very good stands in six of one vanety were stiged, M. LUSTY being 1st with very good Robert Owen; 2nd,

Crook, gr to Lady Hindelp, Droitwich, with Viviand Morel. Incurved blooms were generally good, Mr. Hilder winning for twelve distinct in a strong competition, C. H. Curtis, Major Bounation, J. Agate, and Queen of England being most noticeable. 2nd, Mr. Chook.

In the six meanwel of one variety, some remarkably fue

blooms of Charles H. Curtis were staged.

AMARANTHUS CAUDATUS. - I saw this plant grown in one of the London Parks during the past season, being used as dot-plants in large beds of white Pelargoniums. The plants had clean stems of about 2 feet, with nice round heads, well furnished with their pendulous crimson inflorescence, and the effect was both novel and pleasing. W. H. Aggett, Bermondsey, & E.

Obituary.

ALEXANDER MARTIN BYRES .- Much regret is felt in horticultural circles in the North-east of Scotland at the painful and sudden demise of Mr. A. M. Byres, C.A., the genial and courteons Secretary of the Royal Horticultural Society of Aberdeen, who died suddenly on Thursday, at the age of thirty-nine years. Mr. Byres had been Secretary of the Royal Horticultural Society of Aberdeen for several years, during which time he did yeoman service for its interests. Quiet and unassuming, Mr. Byres had many friends. His funeral, which was attended by a large concourse of mourners, took place on Monday, the 16th just.

[The term "accumulated temps rature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending November 14, is furnished from the Meteorological Office :-

"The weather during this period was changeable. Rain fell frequently in the north and north-west; in the more southern and south-western districts the conditions were generally fair and dry until nearly the end of the week, when rain again extended to all parts of the country.

"The temperature was a little above the mean in Scotland, and just equal to it in the north of Ireland, but over England and in 'Ireland S. 'it was weak below the nearest the

and just equal to it in the north of Ireland, but over England and in 'Ireland, S.,' it was again below the normal, the deficit ranging from 1° to 3°. The highest of the maxima, which was registered on the 11th or 12th, ranged from 50° in 'Scotland, E.' and 'England, N.W.,' to 51' in 'England, E.' The lowest of the minima were recorded during the earlier days of the week, and ranged from 21' in 'Scotland, W.' 23° in 'Ireland N.,' and 24° in 'England, S.W., 'and 'Ireland, S.,' to 20° in 'England, N.E.,' and to 55° in the 'Channel Islands.'

⁶ The rainfall somewhat exceeded the mean in 'Scotland, N.,' but was less than the normal in all other parts of the Kingdom.

"The bright swashene was deficient over the greater part of the Kingdom, but exceeded the mean value in 'England,

S.W. and N.W.,' and 'Ircland, S.,' and the 'Channel Islands.' The percentage of the possible amount of duration ranged from 34 in 'Ireland, S.,' and 31 in 'England, S.W.,' to 15 in 'Eogland, N.E.,' 7 in 'Scotland, E.,' and only I in 'Scotland,

COVENT GARDEN, NOVEMBER 19.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmee, who revise the list, and who are responsible for the quetations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. En.

ENQUIRY.

"He that questioneth much shall learn much."-BACON.

SOIL FOR POTTING BULBS .- Mr. H. J. Elwes of Colesborne will be greatly obliged if some of our readers residing in the neighbourhood of Mitcham would tell him where he can get a truck-load of good top-spit loam, suitable for potting stove and greenhouse bulbs which do not like lime in the soil? He asks for Mitcham soil, because that very able gardener and hotanist, Dean Herbert, remarked that, when he lived there, he could grow many species of bulbs well, especially Cape or Indian kinds which would not thrive in the soil of his Yorkshire garden. He remarks that many Lilies and Orchids refuse to grow satisfactorily in any compost of which the local soil forms part, and finds it impossible to get a really lasting potting-soil in the neighbourhood of Andoversford.

"FLORA OF THE BLACK HILLS OF SOUTH DAKOTA."-The United States Department of Agriculture in the Division of Botany has contributed from the National Herbarium a report entitled Flora of the Black Hills of South Dakota, by Mr. P. A. RYDBERG. The account is based upon a botanical exploration made in the region by the author in 1892. The Black Hills are stated to be on the boundary line between South Dakota and Wyoming, the larger part lying within the former State. They constitute an isolated range about 120 miles long, and 40 to 50 miles wide. It was found that the hills had a very varied flora, showing plants from the east, from the Saskatchewan region, from the prairies, and tablelands west of the Missouri River, from the Rocky Monntains, and even from the region west thereof. Iu the foot-hills, and the lower parts of the hills proper, the flora is essentially the same as that of the surrounding plains, with an addition of eastern plants which have ascended the streams. In the higher parts the flora is more of a northern origin. Most of the plants composing it are of a more or less transcontinental distribution, but often characteristic of a higher latitude. The only trees of western origin are Pinus ponderosa scopulorum, and Betula occidentalis; the others are eastern or trans-continental. The flora resembles, therefore, more that of the region around the Great Lakes than that of the Rockics. The collection contains a little over 700 Phænogams and Fernworts. This is certainly, according to the author, far from all that grows in the region. A further report has been made of the Flora of southwestern Kansas of plants collected by C. H. Thompson in 1893. Also an account of Crepis occidentalis and its allies, and of plants from the Big Horu Mountains of Wyoming, together with Leibergia, a new genus of Umbelliferæ from the Columbia River region; and of Roseanthus, a genus of Cucurbitaeco from Acapulco, Mexico. This issue completes volume iii. of the series, and forms an invaluable reference work of plants in little known districts of America.

We have received numerous reports of Chrysanthemum shows, which we are quite unable to notice in the present issue, through insufficiency of space.

BEECHES: Mrs. B. The cotteny substance on your trees is the work of a scals insect or coccus, which is very destructive. We fear that nothing can be done now. Spraying with petroleum emulsion might be serviceable in the case of isolated young trees. As you rightly say, to collect the dead leaves and hury them anywhere near the tress would be the worst possible practice under the circumstances. They should be burnt on the rubbish heap. The trees will most probably die gradually but surely.

Chrysanthemum Sport: R. O. C. The chief quality of Gleire du Rocher is its superb colour when in best condition. The blooms are not extra large, and it is not very frequently exhibited in first-class collections of cut-blooms on this account. The yellow sport you send should be grown on next season under the best culture possible, and it will then be easy to determine its value. At present it is small and unreliable. The general appearance, however, is pretty. We should hardly have thought it to be a sport from Gloire du Rocher. What bud was "taken?"

CLEMATIS VITALEA AS STOCK FOR GRAFTING OTHER VARIETIES UPON: Vitalba. The stocks will serve the purpose, grafting them with one-year or twoysar-eld wood, potting the union below the soil, and keeping them in a warmth of 55°, and mode-To make doubly sure, the graft may rately close. be clayed or coated at the peint of union with grafting-wax. The best time is at the end of winter. The precise part of the stock to operato npon is just at the ground-level, or immediately below it. The method-tengne, cleft, or whipgrafting.

ELECTRIC LIGHT AND CUCUMBER CULTURE: C. A. C. The matter is still in its infancy; and the best methods of using electricity in affording light in forcing-houses are yet to be discovered. You might try some experiments this winter and publish the results. It would not be wise to increase the night temperature.

FIR TREES IN WOODS: A. B. Try Quassia water or Bitter Alees as a dressing. Rabbits do not usually gnaw Fir trees, unless the weather is very severe. If you wish to make the trees quite. rabbit-proof wire, 4 feet high, and sunk in the soil 6 inches.

GARDENERS' MUTUAL IMPROVEMENT SOCIETY: T. G. If it is understood that an exhibit is not houerary, but competitive, points should be given and allowed. No copy of bye-laws has reached us, although a schedule has done so.

IVY AGAINST BUILDINGS: Subscriber. Providing the Ivy shoots are not allowed to penetrate between the crevices of masonry or brickwork, or get into the roof and raise the tiles, &c., they tend to protect a wall against damp. They should, however, have one close olipping when it has covered the wall in early spring, the effect of which is to keep a close leafy surface.

LILY BULB DISEASE: G. M. & others. Recently we have received from two or three correspondents, ineludiug Mr. G. Martin, bulbs of Lilinm Harrisi suffering from a disease of which we have had no previous experience. This is the only species of Lily which has given evidence of the disease, and in this case it seems to be widespread and fatal. The bulbs exhibit brown spots, which seften, and become rotten; the subsequent appearance of a common mould on the spots only complicates matters, and renders investigation difficult, since this mould is only a saprophyte, and has nothing to do with the In the last reference we are informed that disease, 600 bulbs out of 2000 are diseased, which makes it a very serious matter. The bulbs do not start into growth in a proper manner, and when they grow the shoots are stunted and sickly. We have examined the diseased spots with the microscope, and can detect no mycelium, or any disquisting feature, except the presence of a few comparatively minute oodies of a Bacterium typs; but it must always prove a work of great difficulty, requiring patience and perseverance, to determine Bacteriosis nnder such circumstances with anything like certainty. In the present case ("G. M.") we gravely suspect it, but we cannot go beyond suspicion. In face of such an unknown foe, we are comparatively helpless, and it is too late to suggest dipping the bulbs into a solution before planting. M. C. C.

MARKET VARIETIES OF FRUIT: J. M. Dessert Apples, six to sell direct from the trees, Snmmer Golden Pippin, Devenshire Quarrenden, Worcester Pearmain, Colonel Vaughan, Sugar-loaf Pippin, Kerry Pippin, or Lady Sudeley. Culinary, six to sell direct from the trees, Keswick Codlin, Pott's Seedling, Lord Suffield, or where that sort fails, Lord Grosvenor; New Hawthornden, Stirling Castle, Cox's Pemena, or Golden Spire. Dessert varieties, six to store, King of Pippins, Cox's Orange ditto, Gascoyne's Scarlet Seedling, Wyken Pippen, Baumann's Reinette, and Court Pendu Plat. Culinary Mann's Remette, and Court Fendu riat. Culman's Apples for storing, Small's Admirable, Peasgood's Nonsuch, Queen Caroline, Wellington, Priuz Bismarck, Lane's Priuco Albert, and Lord Derby. We will give you a list of Pears and Strawberries next week.

Names of Fruits: J. R., or some similar initials, Your Pear is Baronue de Mello.—J. S. 1, White Deyenné; 2, Small's Duchesse d'Augou-White Boyenne; 2, Smart's Duchesse d'Augurtellème; 3, Soldat Labourenr; Apple, Court of Wick. E. S. 1, Benré Rance!; 2, Easter Beurré; 1, Brabant Bellefleur; 2, Smart's Prince Arthur; 3, Small's Admirable.—A. W. H. 1, Waltham Abbey Seedling: 2, Grange's Pearmain; 3, Beauty of Kent; 4, Golden Noble; Pear, Beurré Bachelier. -Luculia. Apple Gravenstein. - X. Y. Z. Apple Hollandbury; Pear Beurré Clairgeau.—A. L. S. 15, Emperor Alexander; 25, Hoary Morning; 51, Gravenstein; 53, Old Nonpareil; 54, Syke House Russet; 55, Golden Reinette.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—E. J. J. Staphylea pinuata, probably, but the leaves had all fallen. - Constant Reader. Phytolacca decandra.—J. M. B. Oncidium varicosum.—E. H. O. We guess that the detached leaves may be those of Vaccinium myrtillus, but we have not much confidence in the correctness of our guess.

ORCHID DISEASED: A. L. A. The conditious of culture seem to favour the growth of a species of fungas on the Orchids. It may be combated by the use of the Bordeaux Mixture on the plants, say once in three weeks, dipping them in it-not syringing them. If the house could be emptied of all of the plants, and receive a thorough cleansing, using sulphur in the lime-wash with which the brick-work is coated, and the hot-water pipes are painted, these would be means to the same end.

PLANTING UNDER THE SHADE OF BEECH TREES: A. B. Butcher's Broom, Box, St. Johu's Wort, Ivy, Periwinkle, and Scolopendrinm, if not too dry.

Vanda Amesiana: Correspondent. We do not understand what you mean by "crack or break Please inform us which part of the plant is alluded to.

LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Municipal or Angular Chambered

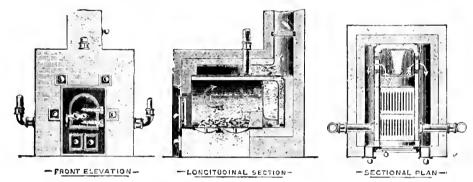

Others with TUBES, SHELVES, & HOLLOW OF ORDINARY CAST-IRON GRATE BARS,

SADDLE BOILERS and WELDED BOILERS.

The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE-a SILVER MEDAL-at the Royal Horticultural Scciety's Exhibition. South Kensington.

MUNICIPAL PATTERN BOILER-THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire-box, water-space, and V shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler. SPECIAL BOILERS made to suit all purposes and requirements, and Estimates given for HEATING APPARATUS,

We make Boilers from £3 10s.

When writing for PRICE LISTS please state approximate requirements.

OUR PRODUCTIONS MAY BE OBTAINED FROM THE LEADING MERCHANTS, IRONMONGERS, and SEEDSMEN, or DIRECT FROM-

MESSRS, PROTHEROE AND MORRIS will SELL the above by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NFNT, December 4, at half-past 12 o'Clock.
On view morning of Sale, and Catalogues had.

Friday Next December 4.

GREAT SALE of CATPLEYAS and LELIAS.
The finest of the Brazilian Orchidic; together with a New Orchid, a glorious Novelty,

EULOPHIELLA PEETERSIANA,

Most extraordinary—a grand thing, like the late introduced Eulophiella Elisabethe; the flowers are large, of a deep rose, produced on strong spikes, which are borne in great quantities from the axils of the lower leaves.

quantities from the axils of the lower leaves.

CATTLEYA AUREA CHRYSTONA and GIGAS, mixed.—We guarantee these as the finest types of aurea and gigas. Collector says labellums are of wonderful substance and colour, and perfect in shape, and that finer forms are among these plants than any he has previously sent.

SNOW-WHITE L.E.IIA.—Four plants only, brought home by our Collectar, who will attend the Sale. Found with Ledia elegans, but snow-white.

Most remarkable type of L.E.LIA REGANS, found with the Licha purpurata, both from the same district as these (flered by us on Nov. 6. Extraordinary varieties are among them, quite superior to any yet known.

L.E.IIA PURPURATA.—A grand lot of plants from same

among them, quite superior to any yet known.

L.ELIA PURPURATA.—A grand lot of plants from same district. Full advantage should be taken of this opportunity. Our collector is certain varieties are among these plants such as have never before been seen in Europe.

CATTLEYA MENDELL.—A very floriferous typs of this grand and now scarce exhibition Cattleya, obtained from the remote interior. The difference in the plants points to the existence of many novelties, and their free-flowering qualities may be seen by the remains of the old snikes.

flowering qualities may be seen by the remains of the old spikes.

CATILEYA SHECIES, offered as received. From the appearance of the plants and the great thick old flowerspikes they bear, it would seem they were leither a quite new species, or a geographical form of Cattleya Sanderiuna.

Also

CATTLEYA VELUTINA, CAMETHYSTINA, L.ELIA DORMANNIANA, L.ELIA PRESTANS (the very dark, rich coloured type). ONCIDIUM MARSHALLIANUM, O. CURTUM, O. SARCODES, &c.

MODESIES PROTHEROE, AND MORRIS

MESSRS. PROTHEROE AND MORRIS will sell the above by AUCTION at their Central Sale Rooms, 47 and 48, Cheapside, London, E.C., by order of Messrs-F. Sander & Co., St. Albads, on FRIDAY NEXT, December 4, at half-past 12 o'clock.

150 ACRES TREES & SHRUBS.

In the finest possible condition, for The Villa, The Mansion, The Plantation, or The Game Covert. All in vigorous, healthy condition, not stunted, starved, or closely grown and drawn. Curefully and frequently moved, and the roots consequently are a mass of fibre, ensuring safe removal when sold.

NEW CATALOGUE, with descriptions of above, and of many Rare and New Plants, post-free from—

CLIBRAN'S Nursery, Altrincham;

Also at MANCHESTER, BANGOR, and LLANDUDNO JUNCTION.

CHRYSANTHEMUMS.

OUR YEARLY INCREASE in the sale of both Plants and Cuttings arises certaioly from the fact that all varieties (1400) are planted out and grown in open pure country fields, cut down early, not allowed to flower, large clumps removed, and replanted near the glass and light. Stock from these are perfect, and the secret why all those we supply carry success wherever they go, striking easily, growing quickly, and producing larger flowers. As a proof, they have made Mr. Mease the Champion of the Champions.

We cordially invite all to

"COME AND SEE"

the oldest, finest, and best kept collection in the world. Splendid illustrated CATALOGUE post-free to coming customers. A list of all varieties exhibited at the last Aquarium Show Iree,

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 28, 1896.

SOME MORE "BOTANICAL MAGAZINE" WRAPPERS.

EARLY in the present year I gave some gleanings (Gardeners' Chronicle, March 28, p. 389), from announcements and advertisements on the paper wrappers of the monthly numbers of the Botanical Magazine, issued between 1809 and 1816. I have now the opportunity of supplementing those notes by a further selection from volumes which appeared between 1827 and 1855, the most brilliant and flourishing period of this now considerably more than centenarian publication. Sir William Hooker's editorship commenced in 1827, combining the duties of artist therewith. As I have more fully explained in my history of the Botonical Magazine in the Gardeners Chronicle for 1887, Sir William Hooker initiated the custom of dedicating each volume to some eminent botanist or horticulturist; and the first one he dedicated to Robert Barclay, who had a fine garden at Bury Hill near Dorking. I mention this because it was not long after this event that his collections were dispersed. The more one looks into the horticultural literature of the present century, the more one becomes impressed with the desirability of a critical history of the gardening and gardeners of this period. But this, by the way. In August, 1831, the sale is announced of the unique botauical collection of the late Robert Barelay, Esq. The collection, I may add, consisted of living plants. In 1833, the advantages of advertising in the Magazine were set forth in the following terms: "The Botanical Magazine, which has been published without intermission on the first day of every month for the last forty-five years, and is circulated among the most respectable classes of society, from its established reputation, elegance, and scientific teudency, must be viewed with interest by all persons under whose observatious it comes, and will be found a most desirable medium to advertisers.'

At this date, Mr. Samuel Curtis, the proprietor, who had an extensive nursery at Glazenwood in Essex, was the chief advertiser in the trade. He appears to have had a very extensive collection of American plants, including many rare things. The genus Stuartia is specially mentioned. Of Roses, 600 named varieties are offered, so it must have been difficult to make a small selection. Kindred publications figure prominently in the advertisements, and some of them must have been in the nature of rivals. In May, t833, the twentythird number of the Harticultural Register was announced. This publication was commenced in 1831, under the joint-editorship of Joseph Paxton and Joseph Harrison, and its history and developments are interesting. Paxton, as

everybody knows, was gardener and forester to the Duke of Devenshire; and Harrison was gardener to Lord Wharncliffe. The Horticultural Register was a cheap rival of Loudon's Gardeners' Magazine, established in 1826, to which neither Paxton nor Harrison had been a contributor. But the Register had a chequered and short eareer, the cause of which I have not attempted to discover. Paxton's name appears alone as editor of volumes two and three. His name then disappeared, and in its place came James Main, A.L.S., in the fourth and fifth (and last), so far as I have ascertained. Main collected in China, on behalf of Gilbert Slater, Esq., concerning whom very little is known, but Main states that Slater was the actual introducer of Hydraugea hortensis, Eriobotrya japonica, Rosa semperflorens, and a number of others; further that he always divided whatever he hall of value with Sir Joseph Banks for the Kew collection, as a safer means of preserving what might be received. This is interesting, because Banks is the accredited introducer of these plants in Aiton's Hortus Kevensis.

The secessions from the Horticultural Register seem to have been the outcome of some dissatisfaction, for in each case the secoder became the editor of a similar publication. Harrison started his well-known Floriraltural Cubiact in 1833, and in the preface to the first volume, he boasts of having a circulation of nearly fifty thousand copies in nine months. This number probably referred to the monthly parts. In 1834 Paxton associated with Robert Marnock, founded the Magazine of Butany and Register of Flowering Plants, a more ambitious publication. Marnock and Paxton soon parted, and the former became editor of a new publication, entitled the Floricultural Magazine and Miscellany of Gardening, which was by no means so well illustrated as its rivals, and soon ceased to appear. But I have been led into a bibliographical digression, and must return to my advertisements. In August, 1833, the first volume of Don's "improved edition" of Miller's Gardeners' Dictionary was announced, price £3 12s. This ran to four volumes, but was never completed. In December of the same year the St Germain de Martin Pear was advertised from Martin Hall, at a guinea; only eighty plants to be issued. Fuller's freezing machine and the Perryan pens were persistently recommended about this time; and a city tailor offered to provide so many suits of clothes a year at a given price, provided the old suits were returned! In 1835, Hooker's Companion to the Botanwal Magazine, and Deakin and Marnock's Florigraphia Britannica were announced; and in 1836 The Botanist, conducted by B. Maund, F.L.S., assisted by the Rev. J. G. Henslow. latter is a high-class illustrated work, which ran to only five volumes. Various artists contributed, among them two of Maund's daughters and Mrs. Withers. George Bentham was also a contributor. What part Marnock took in the Florigraphia is not explained, but his name appeared only on the first part, and not at all on the title-page of the complete volume. The next advertisement of special interest is the trandeners' Gazette, the first number of which appeared January 7, 1837, price 5d. This is not in the Kev library, but my friend, Mr. Daydon Jackson, kindly looked it up for me at the British Museum. Its full title is The Gurdeners' Guzette: a Weekly Journal of Science, Literature, and General News. It was issued in the same form as the present Gardeners' Chronicle, and was, in a sense, the forerunner of it, edited by George Glenny. Its independent career, however, was a short one, as it was amalgamated with the United Gurdener and Land Stewards Journal in July, 1847, then in the third year of its existence, edited by R. Marnock, Curator of the Royal Botanic Society of London. This was contimued under the modified title of Gardeners' and Farmers' Journal until 1851. At all events, we have nothing later than that at Kew. Up to within two years of its demise, it was run, according to the title-page, for the benefit of indigent gardeners and

farm-bailiffs, and their widows and orphans. In the meantime, iu 1841, the Gardeners' Chronicle was founded, with Dr. Lindley as editor of the horticulthral part. A full-page advertisement of it appeared in the Botanical Magazine for April, 1841; and at that carly date the proprietors were able to publish a long list of able writers and contributors, both in practical and theoretical matters. Looking down that list of between sixty and seventy names, mostly of men who were famous, or who became famous, I do not see one whose owner I know to be still surviving. But when we remember that the Gardeners', Chronicle is already near the end of the fifty-fifth year of its existence, we can hardly expect to find many of the original contributors. J. C. Loudon's numerous and laborious works were now copiously advertised in the Mugazine, although he, brave sufferer, was near the end of his career -a career of almost unparalleled activity under the most adverse circumstances. Few who have used his wonderful compilations have any idea of the difficulties under which he worked, and the intense sufferings he must have undergone. Shortly after he came south, as a young man of twenty, he had an attack of inflammatory rheumatism which disabled him for two years, and left him with a stift knee and a contracted left arm. Subsequently his right arm was broken, and then broken again, when amputation became necessary. At the same time he lost the use of the thumb and two of the fingers of his left hand. In addition to these infirmities he had slow disease of the lungs; yet, we are told, his energy and onthusiasm did not desert him even on his death-bed. Among many other things, we are specially indebted to him for the particulars he collected and recorded of notable trees of all kinds throughout the country. To give an instance of the comprehensiveness of his work. I may mention that his Encyclopedia of Plants, in which he was assisted by Lindley and James Do Carle Sowerby, is illustrated by upwards of 20,000 wood-cut figures!

In February, 1838, we find an address to subscribers, in which it is stated that the only honourable competitor in the field was the *Botanical Register*, and considerable alterations had been made in the plan in order to make it more attractive, but that the *Botanical Magazine* would be continued in its old form, in spite of the fact that the proprietor was losing money by it.

In July, 1838, Mrs. Gore's Rose Fanciers' Manual was offered at 10s. 6d., with the avowed object of "rendering every amateur a Rose-grower." Whether Mrs. Gore was in the trade does not appear, but the work was adapted from the French, though it was intended to make our "gardens independent of borrowed attractions," whatever that might mean. Whether the amateurs really benefitted by it is doubtful, inasmuch as 2500 varieties were described, which would probably perplex rather than help him. An advertisement of September, 1838, puzzles me rather; but perhaps some reader of the Gardeners' Chronicle may be able to elucidate the matter. It is the advertisement of a Practical Treatise on the Material used in the Construction of Hot-houses, Conservatories, &c., by J. Thomson, nurseryman and landscape gardener, Croydon, Surrey. He describes himself as the designer and inventor of the improved wrought-iron boiler for heating conservatories, &c., and alludes to his fifteen years' experience in Her Majesty's Royal Botanic Garden at Kew, and his subsequent position as head gardener to the Duke of Northumberland at Syon House. Although there are some discrepancies, I think this must have been the J. W. Thomson whose autobiography was published in the Journal of the Kew Guild in 1894, when he was ninety years of age. He mentions establishing the "Exotic Nursery" at Hammersmith in 1835, where he had about an acre of glass erections; but he says nothing of Croydon.

Harrison's Floricultural Cabinet is advertised in December, 1838, as an unequalled medium for advertising anything connected with gardening, having a circulation of nearly 10,000 copies monthly. Among books aunounced about this date were Miss Jackson's Pictorial Flora, or British Butany delimented in 1500

lithographic drawings; and the first edition of that handy little book, Lindley and Paxton's Botanical Dictionary. Miss Jackson's book is probably not very widely known, and it is of no great use, because the figures, though admirably drawn, are too small (twelve on an octavo page), especially of closely-allied species. In 1844, the first number of a new Horticultural Magazine, price 1s., was accounced to be published by Houlston. I have not seen any part of this publication.

Coming down to 1851, we find that the dark blue wrapper has been replaced by a light green one, such as the Magazine still appears in, with a view of the Palm house at Kew on the first page. But this change probably took in 1845 when Samuel Curtis'e name disappeared from the title page, and Reeve became the proprietor and publisher. This year, 1851, is a memorable one for horticulturists in many ways, including Paxton's great achievement in Hyde Park. A view of the "Palace of Glass" was given on the May number of the Magazine as a heading to Rowland's advertisment of his "Kalydor," &c. Among the numerous illustrated books of that period I may mention the Victoria Regia and the Rhododendrons of Sikkim-Himalaya, and here I must stop. W. Botting Hemsley.

NEW OR NOTEWORTHY PLANTS.

LOWIA GRANDIFLORA.*

WE are indebted to Mr. Bull for the opportunity of figuring this singular Orchid-like plant from the Malay Peninsula. The plant is technically stemless, the flowers springing in a cluster from the base of the petiole. The leaf is breadly oblong, lanceolate acuminate, tapering at the base into a concave petiole. The flower-tube, as may be seen in the illustration (fig. 111, p. 653) is about 7 cent. long, cylindric, wrapped round at the base by a herbaceous bract. The three reflexed sepals are olive-coloured, as long or longer than the tube; upper petals short, purplish, linear lanceolate, tapering from the base, fimbriate at the tips; lower petal much larger, lip-like, spreading, with a broad purple concave stalk, expanding into a large oblong acuminate, pure white, rather thick limb, 6 to 7 cent. long, 25 mill. lat., covered with a viseid exudation; the margins of the lip are replicate, as shown in the section. Stamens five free, anthers linear; evary glabrous. Style purple, dividing above into three purple, fringed stigmas.

On October 23, 1886, Mr. N. E. Brown described in these columns a very similar plant to that new described, but with smaller flowers. That plant he considered to form the type of a new genus of Scitamineæ, which he accordingly described as Orchidanthe borneensis. Father Scortechini, about the same time, described the genus on the plant which forms the subject of this note, his publication dating, as we suppose, from the beginning; that of Mr. Brown from nearly the end of the same month. Petersen places both Lowia and Orchidanthe at the end of the Musaceic, but although the plaute are, as he says, insufficiently known (ungenügend bekannt), yet, having seen both the species, we can have no doubt that they belong to one and the same genus. The present species is an ernamental and curicus stove plant. M. T. M.

This species is intermediate in character between D. illustris var. glabra (Botanical Magazine, t. 7156), and D. eximia, described by me in the Gardeners' Chronicle, third series, xiv. (1893), p. 120, having flowers very similar to the former, and leaves

Lawia longillora, Scortechini, in Nuov. Giorn. Ital., xviii., 308, t. 11; Baker, in Hooker's Flora of British India, vi. (1894), 264; Petersen, in Engler and Pranti. Naturtichen

^{(1894), 264;} Petersen, in Engler and Pranti. Naturlichen Pflanzenfamilien (Musaceæ), 1889, p. 10.
† Dipladenna Sanderi, Hemsl., n. sp. -D. undique glabra, ramulis floriferis gracillimis, folia distincte petiolata, subcoriacea, oblonga vel anguste obovato-oblonga, cum petiolo semipollicuri 2-3 poll. longa, acute acuminata, basi rotundata, subtus pallidiora, costa supra leviter elevata subtus leviter impressa, venis immersis inconspicutis. Flores rosei, circiter 3 poll. longi et lati; calycis dentes lineari-lanceolati, acutissimi; corolle tubus ad medium cylindratus dein gradatim dilatatus, lobis rotundatis. W. Botting Hemsley.

more like the latter. Of D. eximia I have only seen the one small specimen I described, and it is possible that it attains larger dimensions than those given by me in the place cited. It is characterised by having nearly orbicular leaves, about $1\frac{1}{2}$ inch in diameter, borne en stalks less than $\frac{1}{4}$ of an inch long, flowers about 2 inches in diameter, and the corolla tube scarcely exceeding 1 inch in length. D. illustris var. glabra has relatively large leaves, with numerous very prominent transverse veius, flowers 3 inches in diameter, and the corollatube is about 2 inches in length. D. Sanderi has rather thick oblong or narrowly obovate-

THE ASH OF ORCHIDS.

The following interesting correspondence between Dr. Kedzie of the Agricultural College, Mich., and a friend, arising out of the doctor's paper read before the Society of American Florists, at Cleveland, appears in the Florists' Exchange:—

"I have been interested in reading a reprint of your paper entitled The Chemical Tripod in Floricalture, in the Florists' Exchange. In it you make the statement that no plant can grow in the absence of potassium and phosphorus. Are you correct in this? If so, will you kindly let me know where

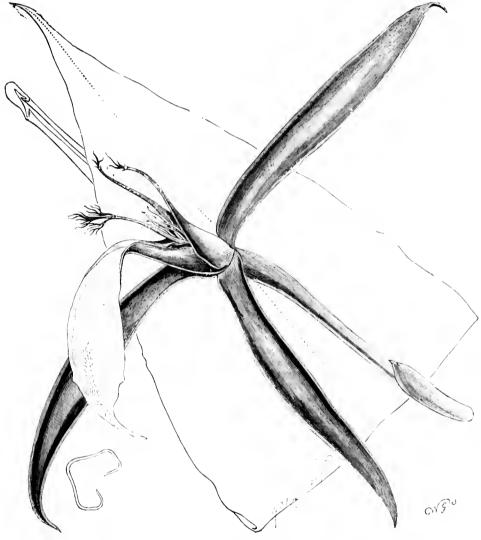

Fig. 111.—LOWIA LONGIFLORA: STOVE PLANT.

Sepals olive, lip viscid, pure white, with recurved margins, and with a broad violet-coloured stalk; style and stigmas purple. (See p. 652.)

oblong leaves, including the stalk, from 2 to 24 inches long, acuminate at the apex, rounded at the base, pale underneath, and very obscure venation; petioles about half-an-inch long. flowers of all three are very similar in general colour, but those of D. eximis are ef a brighter, deeper, rose than the others. D. Sanderi wants the darker circle of colour at the mouth of the tube, characteristic of D. illustris var. glabra. In other respects, the flowers of these two are very much alike, except that the cylindrical portion of the tube of the corolla is proportionately longer in D. Sanderi. This ornamental addition to a favourite genus is a native of Brazil, whence it was imported by Messrs. F. Sander & Co., of St. Albans, whose name I have the pleasure of associating with it.

cpiphytal Orchids get these elements? I am working on the subject of nutrition for Orchids, and want to secure all the light available. Gray states that oxygen, hydrogen, nitrogen, and carbon are the only absolutely necessary elements needed by all plants. Of course, the terrestrial plants do not flourish without the mineral elements. Do you know whether Orchids analyze any mineral elements? Of course, there is dust in the atmosphere; but is hardly seems pessible that any solution of it can reach many varieties of Orchids in their natural habitat. I should be under great obligation if you can give me any scientific information on this point."

To the above question, Dr. Kedzie replied as follows:

"Your esteemed favour is received, in which you call

in question my statement that no plant can grow in the absence of potash and phosphorus, and ask how can epiphytal Orchids get potash and phosphorus?

"In this discussion it seems to me that the first question to be decided is whether such Orchids contain these ash elements? If epiphytal Orchids do not contain these ash elements it is useless to inquire where they can get them. I have therefore directed my attention to the question whether epiphytes contain potash and phosphorus. Unfortunately these plants are very precions in our greenhouses, and we do not "have Orchids to burn." therefore first turned my attention to an epiphyte growing on forest trees in Florida, and known as "tree pine," the Tillandsia bulbosa. The roots of the plant had freely penetrated the bark of the tree, and the bark had to be cut away to get the separate plant. On burning this plant there remained 3 per cent. of ash, from which 25 milligrams of real potash (K2O) and 18 miligrams of phosphoric acid were obtained.

"A quantity of Florida-moss, Tillandsia usneoides, was burned which gave 2.20 per cent. of ash. Analysis of this ash gave 3.50 per cent. of real potash, and 1.73 per cent. of phosphoric acid. This ash contained a large amount of salts of lime and magnesia, and nearly half their weight of salts of soda.

Desiring to subject an epiphytal Orchid to the same process, I obtained from Mr. Gunson, the College florist, a fragment of Dendrobium nobile, which weighed 11°245 grams when dry, and left 335 grams of ash when burned, or 2°97 per cent. of ash. From this ash 28 milligrams of potash (K₂O), and 19 milligrams of phosphoric acid (P₂O₂) were obtained. The ash of all these epiphytes contained, in addition, lime, magnesia, soda, silica, and oxide of iron—the same elements that are found in plants growing in the soil.

"If an epiphyte shall be found that leaves no ash when burned, we may assume that ash materials are not necessary for such plant. The fact that the lowest forms of plant life, such as mould and yeast, contain potash and phosphorus in their ash, is significant. I have just gathered a fungus growing on the dead limb of a black Walnut tree, and find it contained 3.65 per cent. of ash, and yielded 38 milligrams of phosphoric acid. The presence of potash and phosphoric acid in all forms of plant-life is something more than an accident, and bears some important relation to nutrition.

"I now return to the question with which you started: Where do these plants get these vital minerals! Manifestly from some outside source, because plants do not form mineral matter. That epiphytes are on the alert for mineral matter is shown by their careful conservation of the ash elements they already hold. Note the thin and papery character of the cast-off leaves of Orchids, in comparison with the shed leaves of forest trees. The Orchids seem to search the pockets for the last penny before they throw aside their worn out clothes.

"Plants that grow within the reach of the ocean spray carried far inland by the wind, such as the Florida-moss, may obtain ash elements from sea-salts lodged on them. The large amount of the soda-salts found in Florida-moss would strengthen this impression.

"Parasitic plants, like the Misleto, by means of their hausteria, penetrate the cambium of their host, and drmk in with the sap both mineral matter and organic food. In like manner the arboreal epiphytes by their roots penetrate the bark of their host, and may derive mineral matter from this bark, which is seven times richer in ash elements than the wood. Many saprophytes derive their mineral as well as their organic food from decaying wood, and it is reasonable to suppose that arboreal epiphytes should derive their mineral food from bark.

"If the Orchid is attached to a brick or an earthenpot, such materials are merely hardened soil, and from
them the plants, by the acid juices of their roots, may
extract mineral matter. Florists often place moss in
in the frame that supports the Orchid to retain water,
and the plant may derive a supply of ash. The firm
attachment of the roots of Orchids to the wooden

frame that gives them support, suggests the possibility of the extraction of mineral matter from the wood. If the water given the Orchids contains mineral matter, this becomes an evident means of supplying ash food to the plant. By water culture I have raised stalks of Indian corn 3 feet high with no source of mineral food, except well-water frequently changed. It may be found that by watering Orchids at the proper time with a very dilnte solution (one part in a thousand of water) of the phosphate of potash, the growth of the plant may be promoted.

"It is claimed by some that atmospheric dust is the source of ash elements to epiphytes, but this is donbtful unless the dust settles upon the bark or other support of the plant, and thus comes in contact with the roots of the Orchid. We have no evidence that the leaves of land-plants absorb mineral matter. The normal channel for mineral matter is through the roots of plants."

through the roots of plants.

HOME-GROWN AND AMERICAN FRUIT.

That the crop of American Apples is this year both large and wonderfully good my readers may ascertain for themselves, apart from market reports, if they will but look in at the nearest fruiterer's or grocery stores, where, as everywhere now, American Apples are sold. In face of that fact, it is astunding to read in the Westminster Gazette an emanation from the London habitation of Lord Winchelsea's new home-produce venture—an inexact statement, that "there is no fruit so wholesome and luscious as the Kentish Apples and Pears, which are, alas, too often left on the trees to rot because the market is glutted with inferior foreign fruit."

It is an unfortunate fact that the foreign fruit, so far from being inferior, is often much superior in appearance and sample to our own. That every dispassionate person must admit, and in all cases where such fact is apparent, even in relation to other produce than fruit, it is so much better to say so. rather than to trade on falsehood. Did the Kentish Apples and Pears shown at the Crystal Palace or elsewhere from Maidstonc represent the average sample of fruit produced in that or in any other fruitgrowing county, then the Winchelsea House statement would be true. But, again, if it were in relation to the superiority of our market fruit, then it would still be false and misleading to state that such fruit was allowed to rot on the trees. No one yet ever found good fruit to be unmarketable, especially Apples. It is the rubbish which finds no sale, and would still be comparatively worthless were there no foreign fruit in the market. But America can, because of her climate, give a finish both in colour and in clearness of skin to her Apples, that ours generally fail to furnish. That must be always a point in favour of her fruit. It is but needful to examine the Gravensteins and Kings of Tompkins County, now seen in such abundance, to understand that fact, yet neither of these varieties can claim to be first-class by any means. Neither are to be compared to our best Bismarcks, or Cox's Orange Pippins, but how wonderfully superior are they to our average market samples. Then look at the grading. It is really wonderful, and shows what immense eare is taken, not only in the handling of the fruit from gathering to packing, but also in the sizing. Positively from out of thousands of barrels of any one variety, it seems as if every fruit had been made in the same mould. When will our market-growers learn to take the same pains, and adopt the same methods? why still send to market in returnable wicker-baskets. the worst of all possible utensils to pack fruit in. when tubs or boxes would be so much better? and labelled conspicuously as bome-grown fruit, if thought desirable, would no doubt find their way where homegrown fruit does not now, into the abiquitons grocery store. There are foolish people who think the surest way to secure sale for home produce is to appeal through this system of labelling to people's patriotism; what a wretched delusion! Appeal to the sense of sight, and to the pockets, if possible, but in no other way can the purchasing-public be reached.

Give the public the choice of medium and better—a few may prefer the better, if it really be so; but, in the majority of cases, the cheaper will be preferred. Thus, the Merchandise Marks Act, having branded various produce as of foreign origin, has but helped to advertise it as better than our own, because it often really is so, or because it is cheaper. Only the other day the Lincoln Board of Guardians had to give the preference to Danish butter, not because it was cheaper, but because, being better made, it would in bulk keep so much better. Yet these guardians were eminently patriotic. Very recently, in a fruiterer'sshop at Guildford, I enquired the price of some fine French Pears in a box. I remarked to the shopkeeper, "They are very fine!" And she replied, "Yes; and they pack them so beautifully." In a similar shop in my own town, I remarked on some home-grown Pears in an ordinary bushel basket-a poor sample-and the shopkeoper said, "If they were all alike it would not matter so much; but, at the bottom the fruits are inferior, and much mixed." When the home-grower does not hesitate in this way to cheat his own countrymen, why on earth should the shopkeeper or consumer have much concern for him? It is humiliating to us, as a productive nation, that there should be such lax methods in relation to our fruit. We cannot in all cases excel the foreigner in production, but we may always copy, and indeed, if possible, excel his methods. Our insularity and ignorant John Bullism have proved to be, in relation to fruit and other produce-training, grave stumblingblocks. Far wiser is it to admit our failings, and earnestly seek to amend them. A. D.

MALAYAN ORCHIDS.

The recently-published volume of the Journal of the Linnean Society includes a paper by Mr. Henry Ridley on the "Orchideæ and Apostasiaceæ of the Malay Peninsula. As regards habitats, the author says that :- "The greater part of the Malay Peninsula is covered with dense jungle, which extends to the tops of nearly all the hills, though the trees at about 4000 feet elevation are more stunted. In the low country forest epiphytic Orchids are comparatively rare, and when they occur are usually situated on the upper branches of the loftiest trees, so as to be nearly inaccessible. Terrestrial Orchids, chiefly Neottiere, some of which are saprophytic, occur scattered all through the forests, usually sparingly, and owing to their dull or brown colonring, are often very inconspicuous. The Mangrove swamps and tidal river banks are often very rich in epiphytic species, which sometimes thickly cover the branches of the trees. In the drier and more sunny spots along the sea coast, and the more open rivers, species of Thrixspermum, Renauthera, and Aërides scramble over the rocks in thick masses. The open country, where the forests have disappeared, produces but few species; Spathoglottis plicata, Blume; Eulophia, Geodorum, Bromheadia palustris, Lindl.; Habenaria lacertifera, Benth., occur iu dry, grassy spots. Liparis paradoxa, Rchb. f,; Thrixspermum lilacinum, Rehb. f.; and Vanda Hookeriana, Rehb. f., grow in the grassy swamps. A few common species are abundant in the orchards and gardens of the villages, such as Dendrobium crumenatum, Sw. : D. pumilum, Roxb.; D. leonis, Rchb. f.; D. micranthum, Lindl.; Cirrhopetalum vaginatum, Lindl.; Bulbophyllum clandestinum, Lindl.; Dendrocella trichoglottis, and D. filiformis, and Acriopsis javanica, Reinw.

"In many of the hill forests, Orchids become more more abundant as one ascends; the jungle becomes more open, and on the exposed rocky slopes, called Padang Batu (stone-fields) by the natives, a great variety can often be found. And in these places it is noticeable that species which in the low country are only to be found on the tops of the loftiest trees, are here to be seen growing on the ground, or quite low down on the stems and branches of the bushes and small trees. Thus, on Kedah Peak, at about 3000 feet elevation, the ground in some places is thickly carpeted with plants of Bulbophyllum, Ceelo-

gyne, Dendrobium, Platyclinis, Eria, &c., in such a manner that one is up to one's waist in them.

"A very different Orchid flora is that of the limestone hills, which are scattered about all over the peninsula, but which chiefly run in a broken line north and south. These hills are usually mere isolated masses of crystalline limestone, of no great size or altitude, often many miles apart, but apparently forming lines parallel to the main chain of granite mountains which forms the backbone of the peninsula. Orchids are here very plentiful, growing both on the weathered pinnacles of rock, and on the small trees and shrubs growing in the crevices. The rocks of the Lankawi Islands, which have produced so many peculiar plants of all orders, are also of limestone.

"Flowering of Orchids.—The rainfall being very heavy, and spread over the whole year, there is no distinction of wet and dry seasons; this is probably the reason why there is no special flowering season for most orchids. The greater part of the species flower at longer or shorter intervals throughout the year, though perhaps more may be found in bloom in the first three months."

BELGIUM.

CHRYSANTHEMUMS AT GHENT.

The 162nd exhibition of the Royal Agricultural and Botanical Society of Ghent was held on November 15, 16, and 17, and was devoted to Chrysanthemums, ornamental plants, and Orchids. Most of the exhibits in the Chrysanthemum classes were groups of well-flowered plants, cut blooms being somewhat few in number. The jury was composed of eighteen members, and divided into two sections. The first section was composed of Mr. C. Harman Payne, president; Mr. Dallé, of Paris, secretary; and Messrs. Bevan, H. J. Jones, Stepman, and Val Hal, members. The first section of the jury made the awards in the Chrysanthemum classes, and the second section was appointed to judge the ornamental plants, Orchids, &c.

The most important exhibits were in class 1, a grand sloping group of finely-flowered plants in pots, for which a special prize, a work of art, was offered. This was won by Mr. Ernest Fierens, the courteous and genial secretary of the society. There was a similar class and prize for the trade, and in this the winner was M. de Vricsere-Remens, who had a large group of very dwarf plants, rather smaller in size than those staged by Mr. Fierens. Other groups were staged in good form by Madame O. de Meulenaere-Fierens, De Saegher, and Van der Haeghen.

Cut flowers were staged by Mossrs. Cannell & Sons, Mr. H. J. Jones, and the National Chrysanthemum Society, to each of whom was awarded a Silver-gilt medal. In the collection staged by the National Chrysanthemum Society was a very fine example of Madame Carnot (grown by Mr. Page, of Southgate), which was undoubtedly the premier bloom of the show, and of which the Jury made special mention. Other exhibitors of cut blooms were Mr. Fierens, Mr. de Vriesere-Remens, De Saegher, O. de Meulenaere, and Mr. Van der Haeghen. New seedlings were staged by M. Ernest Calvat, and M. de Reydelles. There were also classes for bouquets and vases of cut Chrysanthemums.

Most of the groups contained good standard varieties that are well known to English exhibitors, but there were some novelties very little known on our side of the Channel. The chief of these were:—

Captain L. Chauré, Japanese incurved, a large flower; colour, deep golden-yellow, shaded bronze,

Madame Eschenauer, Japanese incurved, very large, with deeply-grooved florets; colour, bright rosy pink.

Le Chartroux, Japanese, flat florets, rather long; colour, pure white, streaked and lined purple.

Dr. Duviard, Japanese incurved, florets of medium width; colonr, deep amaranth.

President Nonin, Japanese, a very globular flower, with rather broad florets, deep and solid; colour, golden-buff.

Lawrence Z'dé, Japanese incurved, very large, with florets deeply grooved and incurving; colour, bright rosy-pink.

Soleil d'Octobre, Japanese, flat florets, rather stiff and erect; colour, pale canary-yellow.

Congrès de Bourges, Japanese, tips of the florets slightly incurving; colour, deep rosy amaranth.

Madame Ed. Roger, Japanese incurved, a globular bloom, with incurving florets; colonr, pale watery-green.

Madame Berger, Japanese, a very finely-built flower, similar in form to M. Chenon de Leché, of a peculiarly charming shade of pale rosy-manve, the tips of the florets yellow; a large spreading flower.

Madame A. Brun, Japanese, another spreading flower, with flat drooping; colour, white, shaded and streaked with purple.

Madame Deis, Japanese, of medium size, flat florets, not too bread; colour, white, tinted in the centre.

All the above were staged by M. Ernest Calvat. The novelties staged by M. de Reydelles were all under a number, and although there were several promising novelties among them, any reference in the absence of names would be incomplete. In the various groups we noticed specially the following, not generally known in England:—

Souvenir de Cronstadt, Japanese incurved, very deeply-grooved florets, a close, compact flower; colour, golden ochre-yellow.

Vict. Vaissier, Japanese, very narrow intermingling florets, tips early; colour, rich crimson terra-cotta, reverse golden tipped old gold.

Conté Luigi Sandini, Japanese, florets of medium width, rather stiff and twisted; colour, pure white.

Belle des Gordes, Japanese incurved, a hairy variety, with rather narrow-grooved florets: colour, a charming shade of shrimp-pink, tinted yellow: close and compact.

Madame H. de la Blanchetais, Japanese incurved. Several specimens of this were seen. It has grooved pointed florets, and is a dwarf free-flowering variety but as shown, rather hollow in the centre; colour pale yellow.

Madame J. Chauré, Japanese. A deep flower, florets narrow and sharply pointed, hairy at the tips; colour, reddish-carmine, golden reverse.

Leopold 11., Japanese. A Belgian seedling with flat, intermingling florets; colour, pale salmon-blush.

Jean Liabaud, Japanese incurved. A big solid heavily built large flower, with very broad florets: colour, velvety-crimson inside; reverse, chestunt-broaze

M. Delamotte, Japanese. Florets long and drooping, rather narrow and eurly at the tips; colour, deep golden yellow.

Mdlle. Jeanne Rey, Japanese. Introduced into England a few years ago, but not seen yet in such good form as at Ghent; long twisted florets in the Good Gracious style; colour, pure white.

Perle Dauphinoise, Japanese incurved, solid, and compact in build; medium-sized florets, deeply grooved; colour, a rich shade of golden-build.

Jean Tissot, Japanese, rather narrow florets; red dish-crimson, with reverse of old-gold.

Fleur Grenobloise, Japanese, long drooping florets, curly, twisted, and intermingling; pade pink, flushed purple on the reverse.

Madame Menus de Proli, Japanese; rather flat florets of medium width; celour, pure white.

Piquemal de Rozeville, Japanese, a very distinct and attractive addition to the hairy section; it has sharply-pointed florets, and the colour is dull crimson, with a reverse of golden-bronze, tips golden.

Mrs. W. Coupland, Japanese incurved, very solid in buil l; inside colour chestnut, reverse bronze.

Fleur Lyonnaise, Japanese incurved, rather flat florets; a hairy variety; colour dull rosy earmine, reverse golden.

In all the groups there were to be found some very fine examples of the older-known kinds, such as Madame Rozain, W. H. Lincoln, Etoile de Lyon, Madame Carnot, Hairy Wonder, C. H. Curtis, Mrs. C. Harman Payne, Col. W. B. Smith, Reine d'Angleterre, H. C. Sanderhruch, and many of the best in

the Anemone section. Incurveds were not numerous, but a few of the newest were on view.

The exhibit staged in the name of the National Chrysanthemum Society comprised a representative collection of Anemones and Japanese, and were grown by the following members of the Society:—Messrs. T. Bevan, A. H. Page, J. Brookes, Turk, Martin, and Skeggs.

CHRYSANTHEMUMS AT THE ANTWERP EXHIBITION.

At the Antwerp exhibition Chrysanthemums have played a prominent part lately. The chief exhibitors have been MM. H. Vanderlinden, Alb. Lunden, and Meulepus, amateurs; Berckelaers, Vermeulen, and Verhooghen, nurserymen, who showed plants of much merit. Some exceedingly fine cut flowers were sent by M. Florent Van Hal. In addition to Chrysanthemums there were shown also some good specimens of Cattleya labiata from M. Lucien Linden; C. labiata, Vanda corrulea, Oncidium Rogiersi, O. papilio, and other Orchids from M. Flor. Pauwels; various Orchids from M. Vuylsteke, including hybrid Cypripediums, Ethra, Zephyre, Erato, Louchristianum, Bellone, and Cillione; Cattleya aurea, several Odontoglossum Pescatorei, and other plants. O. crispum from MM. Janssens and Cie. was accompanied by Oncidium Rogersi of unusual size.

GHENT .- At a recent exhibition at Ghent I noted Cypripediums from M. Ed. Pynaert; C. Massaianum from M. Alf. Van Imshoot; a fine collection of mixed Orchids from M. L. Desmet Duvivier, including many pretty Dendrobiums, Phalænopsis, Oncidium macranthum, of a brilliant golden yellow colour; Cypripedium Hornianum, Cattleya Warocqueana marmorata, Miltonia vexillaria rubella, Promenca citrina, Cypripedium enryandum, selligerum majus, Schroderm, Pleione lagenaria, and Cattleya Bowringiana. The finest Cattleya shown was C. Peeters iana from M. Van Imshoot. MM. De Smet frires sent some handsome Palms, Ferns, Cycads, and other ornamental plants; among the Palms was Ptychosperma Alexandra in full beauty. There were also Saribus olivaeformis, from the Comtesse de Kerchove de Denterghem : Rhapis flabelliformis, from the Societé Horticole Gantoise: Phonix senegalensis, from M. Em. de Cock; Areca Baueri, from the Comtesse de Kerchove; Rhapis humilis, from the Ghent Horticultural Society; and Areca sapida from M. B. Spac. The Comtesse de Kerchove showed twenty herbaccous and tree Ferns, among them large plants of Adiantum euneatum, A. gracillimum, Cyathea medullaris, Lygodium venustum, Adiantum pentadactylon and trapeziforme, Microlepia hirta cristata, Hypoderris Browni, and Platycerium alcicorne. There was also a fine collection from M. B. Spac of greenhouse Araucarias, including some sturdy specimens. Among flowering plants 1 may mention Veronica spicata, Sparmannia africana, Eupatorium odoratissimum, Sonerila Hendersoni, Medinilla magnifica, with twelve blooms (from M. L. Desmet Davivier), Grevillea Preisii and Lasiandra macrantha.

The Ghent Royal Agricultural and Botanical Society have just published a provisional programme for the fourteenth international exhibition (April, 1898); an important section will be that devoted to specimen plants, and good and old varieties. $Ch,\ D\epsilon, D.$

CETERACH OFFICINARUM, A NATIVE RESURRECTION PLANT.

Although it is well known that this Fern is similarly constituted to a number of exotic species, so that it can withstand with impunity an amount of drought and scorching which would be fatal to the majority of the Fern tribe, I think the following proof of its persistent vitality, which has recently been accidentally afforded to me, may be of interest. At the end of September, turning out the pockets of a coat which I had worn in the Levant in April and May last, I found wrapped up in a piece of paper a dried and shrivelled plant of Ceterach officinatum, which I had gathered on one of my up-country trips, presumably early in May, but certainly in that month, as I left on the 20th. Although it looked a hopeless wreck, it struck me

that here was a fine opportunity of testing to some extent the truth of tales I had heard, of even long-kept herbarium specimens having been resuscitated, so I threw it into water overnight and left it to soak. The following morning the fronds had plumped up, opened out, and assumed the usual dark-green hue, while the roots had stiffened out and their growing points could be seen to be white and healthy. I planted it in a pan, put it into a frame, and in a very few days the central fronds began to resume growth, just as if nothing had happened. This means that after fully feur months' drying, roots and all, he it remarked, the inherent vitality of the cells was absolutely unimpaired. The thoroughly dry condition of the plant was such as no herbarium specimen could well exceed, and as it is obvious that all functions must have been entirely suspended, I do not see any reason why specimens kept for considerably longer periods should not also be capable of revivification in like manner. This faculty explains the fact that Ceterach is so often found on the sunny side of old walls, where, during long spells of dry weather, they would otherwise he extirpated. As it is, we may under such conditions of drought find the little leathery fronds rolled up scaly side outwards, procisely in the fashion of Selaginella lepidophylla of the Texan plains, and only waiting for a good soaking to resume their pristine verdure. Ceterach officinarum, I may add, abounds in Asia Minor, and presents no appreciable difference either in form or size from the species we found native here. Chas. L. Druery, F.L.S.

REARING OF ORCHID SEED-LINGS AT CHARLESWORTH & CO.'S.

THE rearing of Orchid seedlings, particularly on a large scale, is a branch of practice comparatively modern. Since Mr. John Dominy tried his "prentice hand" at Exeter, and fater on at Chelsca, others have followed with small batches, until in these later days Mr. Cookson and others are rearing them by the thousand. There is not much difficulty in getting a crop up of Dendrobiums and Cypripediums, both of which genera cross and germinate somewhat freely. There is much more difficulty in getting up a large brood of Cattleyas and its compeer, Ladia, and most difficult of all it is to get up seedlings of Odontoglossums. We were much struck the other day in going over Charlesworth & Co.'s Heaton Nurseries, Bradford, to see lines upon lines of seedling Cattleyas pricked out individually into 21-inch pots, and all as regular in size as seedling succulents, the picture of health and beauty, judged by an orchidist's eye. There were over 2000 of them pot against pot, which when fully developed will occupy a large house by themselves. These tiny individuals are planted in the centre of their respective pots, among an admixture of chopped peat and sphagnum, interspersed with gritty silver-sand. The Cypriped seedlings, which are even more numerous, are treated on similar lines, and these nursery plantations of Orchids look not unlike beds on a late spring morning of our ordinary seedling Conifers. The house is a low spanroof one, and the whole get up is eye-pleasing and satisfactory.

"But, where are the scadling beds $^{\prime \prime \prime}$ said 1 to Mr. Charlesworth, "Have you sown the Cattleya Ledia seed on the top of puts with which living plants are growing!" "Come, and see for yourself. a house which the easual visitor is not allowed enter, are butches of seedlings in various stages. There the same 25-inch pot is used, there the same kind of material is introduced, and the seed when ready, is sown in regular horticultural practice There is a struggle between the short shaggy moss, and the Cattleya seedlings, some capsules producing greater quantity of fertile seeds than others, and some embryos jostling each other in the struggle for existence, while some others are wide apart. At any rate the results show conclusively that the old notion that existed, and which in many quarters exists still, that the more-difficult Orchids to germinate can only be encouraged to do so on the surface of a pot in which a living Orchid exists, is altogether an erroneous one. Mr. Charlesworth has proved it up to the hilt in his manipulation of capsules and of thousands of seedlings, and the sooner the old practice is exchanged for the new one the letter the results are likely to be. It wants some delicacy of handling to transfer these embryos from their seedling home to from individuals, setting away on their own account; but it is done, and in many cases, when they are more than a year old. Some, of course, much longer: but what must strike every one before whose eyes these seedlings pass, are the remarkable regularity and success of the undertaking. The seedling home seems to be subjected to strong tropical heat modified with a proportionate degree of atmospheric moditure: the growing house for the seedlings individualised consideratly less so.

The eccentricities of abnormal production are, it is to be presumed, still in their infancy. Brassavola Digbyana is called in to intercross with both Lælias and Cattleyas, and the harvest of results is yet to be seen. The hybridising of Sophronites grandiflora with Cattleya Bowringiana, and the beautiful freshlooking seedlings whose inflorescence is yet . and it us, that are coming on in the Heaton-stove, will almost in their sutcome revolutionise our Orchid produce work. What hybridisers and cross, breeders should avoid is the intermixture of colours particularly, not so much forms, as to be neither interesting nor beautiful, with the lineaments of their parentage defaced. Hundreds. ine might almost say thousands, of Cypripedium seedlings would be better chopped up, so far as form and general appearance go. Mr. Charlesworth, in his intercressings, is enleavouring to improve the various species and varieties, and up to now he has a remarkably interesting progeny. J. A.

AMERICAN SEEDS.

The writer of the article entitled "American Seeds," which recently appeared in the Gard ters' Clor. Rous evidently ignorant of the remarkable advance we of the United States have made in the art of seed-growing, especially during the past officen years.

Unlike the European seedsmen, who have aimed to liscover how best to grow each species under their local conditions of soil and climate, we have studied to discover what conditions are most favourable for the highest development of each species, and our country is so wide, and in climatic character so varied, that we have found some spot in the United States where the local conditions are the most favourable possible for the production of the highest type of nearly every vegetable. Americans are famed for the persistence with which they seek to do everything they have to do with the least expenditure of human labour, and we have so modified old methods of cultivation, and if saving seeds or developing new ones, that we can and do produce seeds of the best quality at a lower cost in hours of labour than our competitors across the water. It may be true that we have not many seed farms such as the writer refers to -we are too wise to waste our energies in that way, but there are sections where many farms tre largely devoted to, and their owners have become experts in, the priluction of the seeds of some vegetable which grow to except and perfection in that Leality.

Our American system is briefly this. The see Isman carefully studies not only each species but each variety he handles, to discover what are the requisites for its highest development. He finds the locality which will host meet these requisites. He level is stock seel of the highest possible quality, and seals at to that locality to be used in growing, under his direction, a crup of seel for him. It is not stronge that he in this way produces seeds not only of better quality, but cheaper than they can be grown in a farm, no matter how skilfully conducted, where the attempt is made to grow a great many varieties.

We fear our writer will need to do more than appeal to the patriotism of consumers in order to impate our cosfally with American-grown seeds. In $M(Fear \otimes C_1, D(fear), M(fear \otimes Fear \otimes Ear hange.)$

FRANCE.

CHRY-ANTHEMUM SHOW IN PARIS.

Ox November 17 to 22 a grand exhibition of Chrysanthemums, fruit and vegetables, was held in the Palais de l'Industrie. Chrysanthemums in pots predominated, but there was a good display of cut blooms, the raisers of new seedlings mustering in strong force. The National Chrysanthemum of London sent a deputation, consisting of Messrs, C. H. Pavne, Thos. Bevan, and H. J. Jones, who were invited to serve on the second section of the jury. The attendance was large, and continued so during the whole time the show was open. There were no money-prizes, the awards consisting of bronze, silver, silver-gilt, and gold medals of the Society, with several special prizes by the President of the Republic, who pers nally visited the exhibition both on the first and second days, and by the Minister of Agriculture.

A large number of new seedlings was staged by such eminent growers as MM. Calvat. Nonin. De Reydellet. Héraud. Scalarandis, Chantrier. Morières, and Gormichon. Seven First-class Certificates were awarded to M. Ernest Calvat for his novelties, three to Mr. Scalarandis, and one each to MM. Heraud. Nonin, Quétier, and De Reydellet. Many of these new varieties will not be distributed until next spring. The cut-bloom classes were well filled. MM. Confillard. Calvat. Rosette, Anatole, Cordonnier. Oudot. Lévèque et Fils, Vilmorin-Andrieux et Cie., Ch. Molin. Ragneneau, and others, occupying an important position, and receiving suitable awards.

Pot-plants in groups were very fine. A grand display was made by Messrs. Vilmorin-Andrieux et Cie., Nonin, Patrolin, Bontreux. Delavier, Lévêque et Fils. De Fresne, and Geraud. Other exhibitors, such as Messrs. Yvon et Fils, Ragout, Vacherot, and Oudot, also had good exhibits. A grand Prix d'Honneur, a work of art, was effered by M. Felix Faure, the President of the French Republic, and was won by M. Auguste Nonin, who staged a wonderfully interesting collection.

The building is well lighted from an arched glass roof, and the show was held ou the upper floor in the rooms in which the salon is annually held. Altogether there were fourteen of them, and they were none too large to hold the uumerous exhibits. Without counting cut blooms, there were twenty-five immense groups, in some cases containing the exhibits of several prize-winners.

The wide stone-staircase leading to the exhibition was tastefully decorated on each side with Palms. Araucarias. Hollies, and foliage-plants, interpersed with Chrysanthemums: and on the top landing M. Truffaut of Versailles had a most attractive display of Hortensia Otaksa, which was purchased by one of the leading Paris florists, M. Lachaume, of the Rue Royale.

After the judging was over, a luncheon was offered to the jury. M. Viger, late Minister of Agriculture, presided: and after the usual loyal toasts, proposed the "Health of the Foreigu Members of the Jury." Mr. C. Harman Payne replied in French, expressing his pleasure at seeing so fine a show, and thanking the Society in his own name, and in the name of his fellow-countrymen, for the horour done to them in being invited to take part in the operations of the jury. Mr. Henry de Vilmorin also made some remarks.

Throughout the show there was a great variety, large numbers of the blooms staged being unknown to English exhibitors. Hairy novelties abounded; and we may on some future occasion allude to the most promising more fully than we can do at present. There were 109 classes, without taking into account the exhibits hors concours; and the list of exhibitors, many of whom entered in a large number of the classes, amounted to ninety-five. Upwards of 150 awards were made. This was the first time the show was held in the Palais de l'Industrie, and it may be regarded as an unqualified success, although from an English point of view, staging cut blooms in glass-bottles is not nearly so attractive as on the ordinary green painted show hourds.

CHRYSANTHEMUM EXHIBITION AT CANNES.

The second annual exhibition of this kind was held in the society's rooms on November 6, 7, and 8, and proved a great success from the one of last year. Amongst the exhibits was a fine bank of plants in pots and cut blooms from Messrs. Vilmorin & Andrieux's establishment at Autibes, which included all the leading kinds. M. Demole occupied the greater part of the show with a collection of well-tlowered specimens, very fresh, and remarkable for their dwarfness, many of which were not more than 2 feet in height. Amougst the collection we noted Etoile de Cannes (Berthier), a new Japanese variety, brick-red, reverse gold ; Mons. Thibaut et Koteleer (Delaux), reflexed of a deep rich crimson-gold reverse: Marie Conte, white, hirsute; Alpheus Hardy, with several good flowers. J. Nigon from Antibes staged a good collection, including Le Reveil, quilled, copper-red; Master Clewald, Japanese, straw colour, deeper in centre: Eugene Testout, brick-red, light buff reverse, very broad petals.

Several other exhibits made up the show, including a collection of 400 varieties, but they were very badly staged. Amongst other varieties of note were Collose Grenobleis (Calvat), which is probably one of the largest incurved known; the outer petals are quilled. and often lobed, the inner ones plain, colour deep lilac with silvery reverse, measurement of flower exhibited 101 inches across, depth 42 inches. Le Littoral, rich golden yellow; L. Canning, Japanese, blush; Chrysanthemiste (Delaux , hirsute, erimson, reverse bronze, very dwarf; Fleur Lyonnaise, resembling the latter, but deeper in colour : Etoile de Feu, Japanese, fiery red; and lastly, Louis Lacroix, which resembles in form Madame Lacroix, but the colour is a rich pink-in fact, it stands apart from all others of that shade of colour.

All these are of sterling merit, and many of which have not yet found their way into English collections. F. W. S.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM GRANDE,

Messes. Sander & Co. obligingly send us from Bruges a flower of this species with an unusual number of segments. The peculiarity is due to synanthy, or the union of two flowers. The union and consequent loss of space determines the partial or complete suppression of some of the segments.

LELIA PUMILA.

The past season seems to have suited this pretty Lælia remarkably well, for it has bloomed abundantly in many parts of the country, and correspondents have sent some remarkable flowers of it. The most extraordinary was a pure white form sent by D. B. Rappart, Esq., Liscard, Cheshire; and now a very richly coloured variety comes from James Davidson, Esq., Summerville, Dumfries, N.B. This flower is very large, with broad petals and lip. The sepals and petals are of a dark rose-colour, with a still darker flush and a veining of purple. The base of the lip is coloured like the petals on the outside, and on the inside is tinged with orange. The front portion is of bright purple, with a lilac tip and margin. A peculiarity of the flower is that the ridges running down the lip terminate at the front with a raised, Cockscomb-like blade, much more highly developed them in ordinary forms. J. O'B.

CATILEYA BOWRINGIANA.

How very useful this species is at this season, and how deserving to be grown in quantity.

It is an easily-cultivated species, and can be purchased at a cheap price. There are several varieties of it, at least, distinct shades of colour are observed amongst the flowers on different plants which are in our collection, and there is a difference in their foliage. The flowers of one in particular are of a very dark colour when seen in juxtaposition with others, and every year this dark variety produces the largest number of flowers upon its spikes. Last year we counted twenty-three on its largest spike, and at

the present time its two largest spikes have respectively, eighteen and seventeen flowers. It is an improvement upon C. Skinneri, not only because it has more flowers upon a spike, but on account of its flowering at this season, and for this reason it is the more valuable to private gardeners. T. Comber, The Hendre Gueden.

CIPRIPELIUM INSIGNE SANDERE.

A fortnight ago, "J. A.," writing about this Cypripedium in the Gardeness Chrimiele, inquired whether any one else than F. Sander & Co. introduced it, and whether the original plant was large enough to have more than one variety in it. No one else introduced it, and the original plant was so small three or four growths, that only one variety was in the piece. The plant was divided, one part going to Baron Schröder, and the other part to Mr. Measures, both divisions flowering alike. J. H. T.

dangling from the roof of a cool and half-shaled greenhouse in which this fine species and its white variety are both well grown. I enclose you a sketch of the fruits fig. 111 Mr. Bedford kindly gave to me, by permission of the H n. Mrs. Barton.

Lapageria rosea was introduced. I believe, by the only lately-deceased Tim Lobb to Messra. Veirth & Son's Exeter Nursery in 1947, from the highlands of Peru or Chili. It is figured in the Bot. Most, thatford was named in honour of the Josephine Lapagerie, who eventually became the Empress of Napoleon I., and who, as is well known, was a most devoted gardener at Finta nebleau and elsewhere during her happier days. Even yet her private apartments at Fontainableau are redolent of Villets, her favourite flower.

Of course, it is quite natural to believe that this noble plant has often fruite i before this, its jubiles nearly, in our gardens: " it I never happen to have

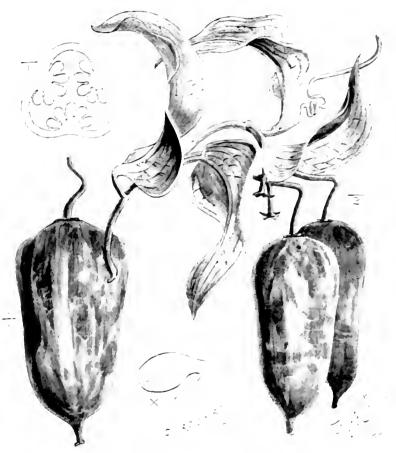

Fig. 110 - FRITTS OF LUFEGREIA BUSALL

CYPRIFEDIUM VILLOSUM.

The variability of this fine old species is well shown at McArthur's Nursery. Maida Vale, London, in a small batch imported some time ago from the Shan States. In size and form they are nothing in advance of the old variety, but the distribution of the colours, especially on the upper sepals, is singular. One form has a yellowish-green dorsal sepal edged with white, and with only a narrow chocolate-coloured band up the centre: another has the upper sepal yellow, tinged half-way from the base with brownish-purple, and with a narrow white margin: a third has a resemblance to the variety known as Boxa'li, but with a rose-tinted margin to the upper sepal; and a fourth is of that pall. I have rendered familiar in C. Chas. Canbam (villosum—superbiens).

LAPAGERIA ROSEA IN FRUIT.

Being on a visit to Mr. Bedford, at Straffan House Gardens, co. Kildare, lately. I was a little surprised at seeing many fruits, some ripe, and others a-mpening. met with its fraits hef to nor have I seen them figured anywhere; though this also must somewhere or other have long ago been done. No doubt, Lapageria would fruit freely enough if properly fertilised, and it is quite possible that some nectar-hunting hawkemoth, or dy, or busy bee on honey intent, has effected the fertilisation of the flowers at Straffan during the past most favourable season.

Lapageria as a genus lib for its allies Philesia. Philageria Vertchin, the hybrid between Lapageria rosea and Philesia hixifilia, at Chelsea i and another rarely-seem genus called Collixene. Formerly placed in a distinct order. Philesiaseæ, they are now our-sidered to be outlying, who ly-habited, and scandent or climbing members of the great order of Lulinie, with the habit of Smiles, and the dowers of selv resembling those of the honely Asparagus, save in their gigantic size, bell-shayed formation, and enhanced phases of coloration.

So far as I can judge by the specimens of the fruit kindly given me at Struffar the seeds seem plump and well-formed, and capable of germination. They have been duly sown under suitable conditions, and

I will report progress, if any, at some fiture time: meanwhile, others may tell is if the fruiting if this plant in British gardens. P. W. Barb dy. [Not very progression Pr.]

BOOK NOTICE.

AN INTRODUCTION TO STRUCTURAL BOTANY
Part II. Fluxrica P. 42. By D. H. Scott,
Ph.D. Adam and Charles Black

Home time ago we had possible to notice in favour. able terms the first part of this little treatise, devited to the flowering plants. We can speak no less far trakly of the present instalment. It is a thoroughly original book, and the well throught out so that the main points of structure, whether they be continuous and homologous, or whether they be itsconnected and contracted, stand out clearly. In the case of the flowering plants, three typical illustrations sufficed to supply a comprehensive idea of structure, and to furnish a more or less connected history. With the so-called flowerless plants, the mase is different. Not three but twenty-three hityres are selected for description and discussion, and the page between them are many and wide. Each one, then, has to be considered separately to a much prester extent than is the case with the groups of fowering plants. The slime funga and the bacteria are instances if great groups whose true nurine and position are still uncertain. The book is excellently clear, but it is not one for the study-sit must be used in the laboratory, and its statements rerified by personal investigation. It will be less valuable to those who have not the resources if a laboratory at their disposal, but to those who desire to get a clear, connected account of the distinctive characteristics and life-listory of the great groups of the vegetable kingdom, we most heartly commend Dr. Scott's listle vilame.

METHODS OF PLANT PROPA-GATION

ta inis

Sticks fie Admeds and Reichtende $y_{2} = I_{2}$ my armille on grafting indicers, the stock advised for Apriess was Apries physical a ribust purple-Howevel variety, or any robust form of A indication for the harmy Robbisherings, R. pontour. Bith if these kinds of stake may be mised from The still in which the seeds are to be sown seed. should consist of a light samily peat, made very running pressure, the seed scattered carefully on the same a light covering of the same kind of soil softed over it to the depth of accurability an inch. After this is done, after the wuter with a fine rose-pot sufficient to wet the soil to the lottom of the pots and place in a college out i as a considerable length of time is required for genas a substantiative ranging of unity or asymmetric generalization, and cannot be shortened, the seed who like sowm as soon as it is night and the policy begin to open. Unless very thick leared, the seedings may be left undisturbed till they are I to uninches high, when they may be potted off singly into small dis making the soil firm about the roots, and shading them till the roots have penetrated the soil. When the roots appear in numbers on the outside of the hall, the glass- are in far being grafted grunded in is then the proper season.

FERNS.

Had I been writing, say, about thirty years ago, there would, perhaps have been no necessity for a separate article on the propagation of Ferns and Selagisellas, but now, owing to the public taste having improved, the demand for Ferns, and their analogues, Pulmus, has been so greatly extended that their rapid on rease and propagation have become a most-roof a one gravity to the dorist und the provide gardener

An American divise his an elementary gardener An American divise has been staying with me lately, and naturally we marked ship," as well as a latitue prospects of the Presidential electric Reglying to my injury and knowing that oraq would not go in which my use he said to Velo I call

culate that our firm's annual output of small Ferns m trays (small flat boxes) and potecs (thumb-pots) is over two millions, besides fifty thousand larger plants in 48 and 60-size pots, and a few hundred large specimens." His is only one of the many establishpients that cluster round New York, north, south, east, and west; but I make no doubt that some of our special metropolitan Fern specialists, notably our good friend, Mr. H. B. May of Edmonton, could even cap this statement. Nor is this immonse quantity a matter for wonder, considering the marvellous elegance and grace inherent in Ferns.

It may be noted here that in those parts of England where it grows wild, the Royal Fern (Osmunda regalis) is called the flowering Fern ; and the lovely "Moonwort" Botrychium lunaria) is also called the "flowering Spleenwort," for the reason that the fertile fronds of each are so covered with thecae that they assume a spike-like character, and appear above the ordinary fronds in a marked manner. So the remark of a lady to me on one occasion, "but they don't flower, do they ?" was, after all, not inappropriate, as at first sight it may seem to be.

No plants that we cultivate is more suitable to associate with flowering plants in a collection than these, while the very low rate at which they are produced and sold makes them accessible to all classes. As an ardent lover of nature, and an admirer of art. I am inclined to think that the prominence given of late to their decorative value has as much to do with our advancing art-culture as the multiplication of art galleries, and the teaching of "free-hand" and other drawing in schools and colleges, while the canon of taste, emanating from South Kensington, "that in art, as applied to decoration, nothing should be faithfully depicted, especially on our wall-papers, carpets, dress, &c., cannot apply to them, as their variety is so amazingly great, that I almost doubt if even an imaginative artist could evolve out of his inner consciousness. and transfer to canvas a form of Fern-frond that does not already exist in nature. Almost all Ferus have a peculiar subterranean stem, from which, at intervals, spring the leaves called in this case fronds; this stem is termed the rachis, a name equally applied to the petiole of the frond by some authors. In Polypodium, Phlebodium, and notably in Davallia (where it forms the Hare's foot in the Canary Islands variety, it more frequently exists just above the surface of the soil, so that it is obvious that by merely taking the Fern and shaking off all the soil adhering to the roots, the rachis may be cut up into small pieces, each piece carrying a frond, or one in its crozier like bud state. Repot the pieces so obtained and place them in a close pit at a temperature of about 60 to 70. When the young fronds appear, they require to be syringed or sprayed gently with tepid-water, and afforded fresh air for an hour or two in the middle of the day according to the amount of bright sunshine present, afterwards keeping them closely shaded from the direct sunlight the whole of the time. When the fronds have attained their full development, air should be afforded constantly, and the amount of shade reduced.

Another self-evident way of propagating Ferms is by division, but it will be noted that in thus treating the useful Madenhair, Adiantum cuneatum, and the noble A. Farleyense, as well as others in a less degree, that unless the pieces used are from the outside of the stock-plant, they will rarely if ever make good plants, and even in some cases they will barely grow; if, therefore, you have enough outside pieces for your purpose, do not pot these

Some varieties of Ferns propagate themselves in such numbers in well-appointed ferneries, that little trouble need be taken in artificially multiplying them. Notably among these are the bulbiferous Spleenworts. as Asplenium bulbiferum, A. biforme, Woodwardia radicans, and others, which constantly produce on their fronds little bulbils, each bearing a frond or tronds, and these only need detaching and laying on moist soil, covering at the same time with a bell-glass. to rapidly develop into useful plants. Nor is this all, for the genus Cystopteris turnishes us with a form (C. bulbifera which produces on its mature fronds quantities of little heart-shaped hard bulbils, which are easily detached, and may be used like the bulbils of the Aspleniums before-named to propagate this genus of Ferns. Some of the Blechnums and also the Polystichums, notably P. proliferum and P. Wollastoni, likewise increase by means of buds or bulbils at the base of the mature fronds, which, being pulled off or cut cautiously, may, in the same way, be used for the increase of their kind. Experience.

(To be continued...

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

Forcing Scakale and Rhubarb .- These subjects will now force early, and, falling suitable accommodation, they may be forced with tree-leaves and stablemanure in the beds where grown. The leaves should be those of the Oak or Beech, and the stable-litter should make one-quarter of the whole. The warmth of such a bed of leaves and litter will last a long time. The earthenware Seakale-pot, or butter-tub with the end out, or a temporary frame-work of rails, can all be made of use in keeping the fermenting materials off the crowns. When a frame-work of sticks is used, some long litter should first be placed over it, so as to prevent the leaves falling down. A stake should be thrust into each bed, which should be about 3 feet in thickness, the stake being withdrawn once a day, in order to ascertain the degree of warmth, which, if leaves form the larger proportion, is not likely to be excessive. If hard frost or much snow fall, it may be found necessary to stimulate fermentation by the addition of stable litter.

Miscellaneous Items. -Cardoons should receive the final earthing up or a thicker covering of hay-bands. Materials for covering the tops should also be in readiness, in the event of sharp frosts setting in. Bracken, where obtainable, is excellent for this purpose. Celery should be similarly treated; that which is fully grown being earthed-up when dry as high as possible, and the banks being finished with a slope at the top to throw off moisture, Bracken or similar materials being conveniently placed to be used for covering the tops in severe weather. The tops of Globe Artichokes are best left unprotected as long as the weather keeps open; the stools, however, should he protected with a covering of leaves or coal-ashes spread around them 6 inches in depth; this will afford sufficient protection for the present, and later, should severe weather occur, litter or Bracken may be hid round about the tops. Celeriae not being quite hardy should have some earth drawn up over the tubers, and some of the largest may be lifted and hid in out of the reach of frost, or put into the root-house for present use. The smaller roots will increase in size as long as the weather keeps open, and they are better for being left in the ground, a little extra protection being afforded them in frosty weather. Cauliflower plants from the second sowing made little progress during the wet autumn weather; any that are now of sufficient size should be potted up, if deficiency in the quantity required exists. After being potted a few days, give water in sufficient quantity to soak the soil through, and winter in a cold Others in hand-lights and frames should have the lights removed whenever the weather is fine and not frosty.

THE HARDY FRUIT GARDEN.

By G. WOODGARE, Gardener, Rolleston Hall, Burton-en-Trent.

Insects and their Destruction.—The present season. when the trees are clear of foliage, should be ntilised bark, and on the shoots. The most destructive of there, I think, are the blue-head caterpillar of the figure-of-8-moth, Diloba cœruleo-cephala; Lacky-moth, Bombyx neustria; mottled Umber-moth, Hybernia defoliaria; Winter-moth, Cheimatohia brumata, as well as some others, lay their eggs in different parts of Apple, Plum, and Pear trees, and which hatch out at the time when the leaves and flowers expand, and on which the caterpillars feed. The figure-of-eight moth may be caught in autumn and early winter by means of a lamp placed under a covering or roof of boards, dressed with coal-tar, to which the light attracts them, and to which they adhere. Spraying with petroleum and soft soap mixture is likewise useful. The caterpillars which appear in the spring may be got rid of in great numbers by shaking the trees, and

heavy applications of water by means of a force-pump. The cocoons should be scraped or brushed off the bark. The Lacky-moth lays its eggs in compact ring-like bands on the sheots, and from these black hairy caterpillars hatch out about the beginning of the month of May, and at once spin a web over themselves. The eaterpillars, when full grown, turn to chrysalids in cocoons suspended anywhere near their food-trees, but do not enter the soil. During the winter these bands of eggs should be sought for, and the shoots on which they are laid out off and burnt forthwith, or otherwise destroyed without removing the shoots. The better way to lessen their numbers is to cut off the shoets and web with which the eaterpillars surround themselves, and burn the whole let, or to plunge them in a soapy mixture containing a considerable quantity of petroleum. Paris Green is useful for spraying infested trees in leaf. Do not let rank grass or herbage be found near the trees. It may be mentioned on Miss Ormerod's testimony, that the cuckoo being fond of hairy caterpillars is useful as a helper. The mottled Umber-moth appears in October and November, and the remedies advised for the Winter-moth namely, grease-bands placed on the tree-stems in October, or earlier, are suitable for this one. The grease used on the bands may be ordinary cart-grease if it be free from tar, or use Horne's Fruit-tree Dressing, remembering that whatever is employed should be prevented from soaking into the bark, and the best means to this end is to first place a good wide strip of greaseproof paper round the stem. Some of the railwayaxle greases, which are made of tallow, palm-oil, water and caustic soda, answer well as smears; others, on the other hand, are harmful. All greases get hard, and require to be renewed twice or thrice during the autumn and winter. For destroying the eggs of these moths the kerosene emulsion should be used in March, scrubbing the trunk and limbs with it. The emulsion is made with \{ \text{lb. of hard soap, preferably}} whale eil soap, and I quart of water. This is heated till the soap is dissolved, when I pint of kerosene oil is added, and the whole is stirred well together. Water is then added till the kerosene forms one-fifteenth of the whole. There are other recipes, but this is a good one. The gardener will be aware of the fact that the wingless females of the Winter meth are carried to the trees by the males whilst pairing. To meet this difficulty the lamp lit at night and the tarred roof will be found useful. The soil underneath trees which were infested this year should be skimmed off and charred, thereby destroying many chrysalids. If this cannot be done, fork it up and expose it to the air and to the birds. Prune late all such infested trees, and burn the prunings, the moth laying its eggs at the ends of the shoots. This does much good. The caterpillar of the mottled Umbermoth is a "looper."

THE ORCHID HOUSES.

By W. H. White, Burford, Dorking.

Temperatures.—During the winter months the temperature of the East Indian-house may range from 60° to 65; that of the Cattleya-house from 55° to 60', the Mexican and intermediate-houses about or, the mexican and intermediate nouses about 55°, and Odontoglossum-house 50°. These figures ought to be adhered to in mild weather, but whilst hard frost or cold piercing winds occur the warmth may fall a few degrees with benefit to the inmates. The higher degree of warmth named is proper during the evening, and the lower degree of warmth is what the thermometer should show in the morning. tivators of Orchids are usually aware of the ill effects of highly-heated pipes, in causing Orchids to get into an unsatisfactory condition, and they take means to avoid heating the pipes to an injurious extent. If the apparatus is not equal to the work it has to do without making the pipes unduly hot, the amount of heating surface should be increased, and the present mild weather is favourable for undertaking this sort of work. In houses where the proper temperature cannot be maintained without excessive firing, and alterations cannot be made, the houses should be covered at night with thick canvas, garden mats, &c. The use of fire-heat in the house in which Odontoglo-sums are cultivated should always be kept as low as the figure given above, or yellow thrips will increase rapidly, causing the loss of much of the foliago of the plants. If the stages are made of battens, and the hot-water pipes are beneath them, a more healthy condition of things is attained by covering the hotwater pipes with rooting-tiles, and over these a thick layer of moss. It is also an advantage to have a small ventilator made close to the spot where the flow-pipe enters the house, because it is at that point that the pipes are hotter than elsewhere. As also

helping to keep the heat from coming directly into contact with the plants, a few yards of canvas-shading may be tacked under the stage, and so arranged that it will hang down in front of the flow-pipe. This piece of canvas, if kept moist, will help to overcome the aridity found at this part of the house. At the present time the indicated degree of day-temperatures will have to be maintained by fire-heat, and on light, bright days as much higher as the snn-heat will raise it; and at such times a moderate amount of air should be admitted to the plants by the top and bottom ventilators. If the wind is cold, slightly open the bottom ventilators only, there then being less risk of chilling the plants than if the top and bottom ones are both opened.

Damping Down .- A great deal will depend upon the position and construction of the houses in affording acrial moisture, and in naturally dry houses the temperature should be kept a few degrees lower than those given, which will render damping down a less frequent necessity. In the East Indian-house tho paths and stages should be well damped down in the morning as soon as the right degree of temperature for the day has been reached, and soon after noon, always wetting the ground below the hot-water pipes and out-of-the-way corners. The Cattleya and Mexican-houses need not be damped so heavily as the preceding one, the majority of the plants being at rest. The intermediate house where there are Vandas, Sobralias, Cymbidiums, Miltonias, Epidendrums, and the cooler-growing Cypripediums in full growth, will require to be well damped down twice daily. The cool or Odontoglossum-house with a northern aspect will need very little damping of the floors, &c., at any time during winter; but a span-roofed house running north and south will probably require damping once or twice every day, according to the state of the weather outside.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

Remarks on Work in General .- Recent frosts having deprived most of the trees of leaves, there should be a general clearing up of the pleasure-grounds and flower-garden. De not in doing this leave leaf-heaps about, as a wind might scatter them again, but forthwith take them to the leaf-heap. Having cleared up the leaves, the walks and roads may be rolled. leaves that collect under shrubs and trees should not be left, except they can be covered slightly with suitable kinds of soil, but raked out for at least some distance from the sides. If other work does not press, the shrubberies may be pointed over with a digging-fork, first affording a dressing of rotten stable manure to those borders which are impoverished. To rake up all the tree leaves, and not afford some kind of manurial aid to the shrubs, is a sure way of bringing them into a bad condition. The leaves collected into the rot-heap should be compacted by treading them, and then covered with branches of evergreens or sheep-hurdles, so that they may not get blown about The leaves of the Oak may be kept apart, these making the best kind of leaf-mould; whilst other and softer kinds are useful in mixing with stable-manure in the making of hot-beds. planting of trees and shrubs may be earried on during mild, but discontinued in frosty weather.

Compost Heaps.—It is usual at this season to cart in the scrapings of the roads and parings from grass verges, &c., which whon thrown together in a heap with some stable or farmyard-manner, by the return of spring, make an excellent compost for dressing flower-beds. It is a heueficial and lasting dressing for the summer bedding-plants. Where not obtainable on the estate, road scrapings may usually be bought for about 1s. a load.

Printing and Clipping of Shrubs.—Hedges of Yew, Privet, and other, may still be clipped; and specimen Conifers and choice shrubs, whose branches are likely to be injured by heavy falls of snow, should be suitably supported. Very useful in this matter are stout cords secured to the branches and the mainstem, these not being so much observed as props and stakes. They can be removed in the spring. Tea and other Roses should be covered up on the approach of hard weather, and it is prudent to have a quantity of bracken litter, &c., stored in a dry place in readiness for this purpose. Ventilate the frames in which Violets are growing every day for some hours, except during frost; doing the same to the frames holding bedding Calceolarias, Violas. Antirrhinums, Pentstemons, Phlox, and half-hardy plants.

Cotonicasters.—These plants being in fruit at the present time are very attractive objects in our

pleasure-grounds, where they are used for covering rockwork, or left to ramble over the ground on the margies of shrubberies at will. When once well-established, Cotoneasters grow vigorously; and the species C. Simonsi associates well with most other shrubs, being of a more upright habit than most others, and it is effective either when planted in groups, or as a solitary plant. C. thymifolia (microphylla) is a dwarf evergreen variety, and may be freely used in the rockery, where it is most effective when allowed to grow unrestricted. The berries are small and bright-coloured. This species when planted at the margin of shrubberies, becomes an effective plant in time, giving very little trouble, needing no pegging-down of the shoots, and owing to its slow rate of growth, not much trimming. frigida (affinis), unlike those 1 have noted above, is a shrub of robust growth, reaching a height of 15 and more feet, with long deciduous, lanceolate leaves, and bearing numerous corymbs of white flowers, succeeded by orange-scarlet fruits the size of those of C. microphylla. It is a highly ornamental shrub during the late autumn. It is best planted in groups, single specimens seldom growing symmetrically.

PLANTS UNDER GLASS.

By JNO. McINTURE, Gardener, Woodside, Darlington.

Zonal Pelargoniums.—The plants which have been grown on for winter display will now be generally in bloom, and should be afforded genial warmth, so that the flower-trusses may expand, and a succession of them be long maintained. It is an error to afford these zonals much pot-room, as the less they have in reason the better they flower. Assistance should be given with guano-water.

Carnations for flowering during the winter season, if raised from layers this year, potted as soon as they were well rooted, and kept growing, should have made good plants, ready for their last shift, which should be into 6-inch pots. Let the potting-soil consist of good pasture loam, free from wire-worms, one-half; dried cow-dung, which has been rubbed through a ½-inch meshed sieve, one-fourth; clean river or pits-and, one-fourth. The soil should be made mode-rately firm about the old ball, and the latter should not be sunk more than half an inch below the new soil. Place the plants in a low pit, having a temperature of 50° warmth, and keep them there till they are about coming into bloom. Carnations older than one year flower more abundantly than younger plants, but the flowers are, perhaps, smaller, if earlier. I am cutting from such plants which will at the end of their season have been a period of eight mouths in bloom. For large plants of Souvenir de la Malmaison, pots 12 to 14 inches in diameter are not too large. Such plants require lime-rubbish and charcoal mixed with the potting-soil, in order to keep it porous and sweet. Healthy plants may be afforded frequent applications of farm-yard manure-water.

Alocasias.—These, if tuberous-rooted, should now be kept dry, water being applied at lengthy intervals of time to keep them from shrivelling. A. Sanderiana should not be dried oft, but kept growing, and it will therefore require water at the roots applied regularly throughout the winter; it should also be afforded a place at the warmest part of the stove.

Store Plants in General .- During December and January keep the heat of the stove at about 60 by night, and 65 to 70 by day, the object of the gardener being to rest the plants as much as possible, without bringing them into bad health. With a lower temperature, less root-watering is required, and the use of the syringe must be curtailed; still, the plants must not be allowed to get infested with aphides, red-spider, thrip, or scale, and a constant war must be carried on against these foes to good plant culture. If winter-flowering plants are grown, these should be given a house or warm-pit to themselves. If a house for the special cultivation of Codimum Crotons exists, the warmth therein kept may range from 5° to 10° higher than the plant-stove, and more moisture be afforded in the air so as to keep red-spider in check. The plants should be heavily syringed with warm water on snuny days, and if mealy-bug be present on them, a wineglassful of petroleum to I gallon of water may be used occasionally. Spotting of the leaves is common on plants that are regularly syringed in the winter, and this is very disfignring to the plants. When these plants are much infested with insects in variety, cleaning by hand is the only sure method of ridding the plants of them. Strong brine may be used on the bark and main branches, first removing that which is loose, which will de-troy all insects and their eggs. A

winter wash for fruit trees not infested with Winter or mottled Umber-moth, is made of caustic-soda and crude potash, each 1 lb.; water, 10 gallons, used at the temperature of 120° Fahr. This also destroys moss and lichens. American blight, woolly aphis, (Schizoneura lanigera), is one of the commouest of Apple-pests, and difficult to get rid of. First prone off the dead masses of old bark, in the crevices of which the broods come forth in the spring to infest the trees. Clear off all rough, rugged bark, and carefully inspect the young bark that is in process of covering the ends of branches and shoots which have been pruned, this being a favourite laying-place; some strong soapsuds brushed into these parts will destroy the eggs or insects. As dressings to be used over all parts of infested trees, I may recommend petroleum, which is best for small young trees, no more being used than to dab the spot where "wool" is noticed, not letting it run down the bark. dressings which smother the insects are tolerably efficient and safe in the using; for instance, line-wash in which a little size is put to make it adhere the better; a lather made with yellow soap, and laid on with an old paint-brush; clear water or soapsuds forcibly applied with an engine. Always act with alacrity whenever any wool is observed on a tree, and uncover the roots and saturate the soil about them with soapsnds, the insect affecting the underground parts of an Apple-tree as well as the brauches and stem.

FRUITS UNDER GLASS.

By W. Port, Gardener, Highelere Castle, Newbury.

Larliest Practices and Necturines. - The earliest house may now be closed, affording it at the first very little artificial heat, a temperature of 40 to 45 at night, and 50 to 55 in the daytime being sufficiently high. Air should be admitted moderately when at the latter figure, and closing the house at 65 with suu-heat. Syriuge the trees, &c., every morning and afternoon till the buds show colour, after which syringing should be discontinued; the paths and other avail able surfaces being, however, moistened as before; and always keep slightly open a few ventilators or lights at the top of the house so as to get rid of any excess of moisture, and keep the air sweet and in motion. A bed of well-sweetened fermenting materials placed in the house will lessen the need of fire-heat, and the moisture rising therefrom will benefit the trees more than applications of water with the syringe. Should the inside border require water, it should be applied at a slightly warmer temperature than the mean of the house, and enough afforded to thoroughly moisten every part of it. Water will not be uccessary if the roof-lights were taken off the house during the last to the rooting its were taken on the house during the list few months; otherwise it should be carefully seen to. Outside borders should be covered with some litter, leaves, &c., and protected in some manner from rain and snow.

Succession and Late Houses.—Pruning, cleaning, &c, should now be undertaken. Should scale infest the trees, a dressing of soft-soap (8 oz. to the gallou), and hot water, being as good a remedy as any. Allow the trees full exposure, if possible, till the time arrives for starting them, as frost cannot injure the wood if it be well ripened; although in the case of trees grown in pots, the latter must be protected with a covering of leaves or dry litter. If hotwater-pipes can be emptied in these late houses, it may prevent injury being done to them by frost.

Strawberries in Pots.—The earliest batch of plants may now be got indoors, for which an early Peachhouse just closed for starting, will be a suitable place if a Strawberry house be not at command. Each pot, before justing it indoors, should be examined as regards the drainage, and to remove worms in the soil; remove decayed foliage, slightly loosen the surface with a pointed stick, and afford a top-dressing of loam and manure in about equal proportions, and a sprinkling of bone-meal or some kind of fertiliser. Afford water with a fine rose-can, and should the pots be too full to hold of a top-dressing, the fertiliser alone may be added and slightly stirred in. Should the crowns, in consequence of rain and cold not be so plump and well matured as may be wished, it will be well to plunge the pots in a slight bottom-heat of fermenting leaves for a week or two, made up in a cool-house or pit, getting the plants near the glass. All stock intended for early forcing should are this have been housed in cold pits or trames, admitting plenty of air to them in all weathers, and affording water to the roots when needed. Plants for late work may be left outside, provided the pots are plunged in coulashes or similar material.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM GENERATIONS OF FORTY-THREE YEARS, AT CHISWICK +41'3°.

In past years we have frequently expressed our regret that our colonial horticultural societies should as sequatiously follow the pattern and methods of the European flower-show. Of course it is natural that the colonist should cherish the flowers that he has known in the eld home, but that he should do so to the neglect or the beauties and novelties around him, seems to indicate a regrettable want of .ppreciation. Or what comparatively minor interest to a lover of plants could a Chrysanthemum -llow be in New Zealand, Tasmania, or West Australia, as compared with a selection from the rich and beautiful floras of those countries : The objection that these wild plants which have not yet been made amenable to the will of the gardener, or modified consistently with the taste : the florist, are therefore of less interest, is easily met. It is only to take them into ultivation, and do to them what their forenothers have done for the Chry-anthemum or ther plants.

It is impossible to realise the enormous pariety, the interest, the beauty, the potentiality or new developments, which now lie well high untouched, whilst our colonial triend- are shaking the old world kaleidoscope. From this point of view it was with peculiar interest that we learnt from the Quiensland The the Market that Mr. F. M. BAILEY, the

and botanist to whom some botanists are un ler so many obligations, had been requested to read a paper on the subject before the typeen-land Horticultural Society. We entirely sympathise with Mr. BAILEY in the remarks he makes: -

Being whe't fir this paper has pleased me more

than I can express, for it shows plainly that the members of the Queensland Horticultural Society are willing and anxious to devote some little of their attention to the cultivation of the judigenous plants. I hope and trust that the tide will now set in, in favour of the plants indigenous to the colony, and that public opinion will henceforth be as strong in favour of our plants as the feeling was against them in years gone by.

I would like to remark, however, that to obtain satisfaction from any plant it must be given a situation suitable to its requirements; therefore, before planting I would suggest that the planter should take into consideration the natural habit of each plant he purposes cultivating-to give it the room it requires for full development; that is to say, he should not place a shade-loving species in full blaze of the sun, or a kind which enjoys a sunny aspect in a dense shade; or an inhabitant of the tropics in the coldest or most exposed situation in the southern gardens. In selecting, it must be borne in mind that under cultivation most plants are found to change, so that because a plant in one of our dense scrubs seems straggling and unsightly there is no reason why, when given room and a sufficiency of light and air, it should not form a handsome, compact shrub: therefore, should its flowers or foliage be thought worthy, do not discard it, but take it in hand at once, remembering that with plants of dense forests and scrubs, there is a constant fight being carried on for those essentials to their existence, viz., light and air, and in search of which they are ever reaching upwards. Thus we find those straight, erect stems formed which are of value to the builder and timber merchant. In only a few instances do we find this tall, naked stem a peculiarity of the tree or shrub.

In a paper read at the Brisbane meeting of the Australasian Association for the Advancement of Science on "The Peculiarities of the Queensland Flora," I drew attention to plants that had come under my notice in which there was a tendency to sport into a variegated foliage. For plants of this character, the plant cultivator should ever be on the look out. They are not so uncommon as some may be led to imagine, and would well repay cultivation for decorative purposes. . With the above few general remarks. I pass ou to enumerate, under different headings, some of the indigenous plants which I consider worthy the attention of our nurserymen and

The enumeration is much too long for us to reprint, suffice to say it contains many of the most beautiful and interesting plants known to us, and not a few which have not been seen here in a living state.

WE have received the following H et. dtur communication on this important subject, which it is now desirable should be freely discussed from a practical point of view :--

 $^{\prime\prime}$ My letters upon the above subject have not passed unnoticed; they have been commented upon in your columns, and I have received numerous replies all admitting the desirability for the establishment of a Home of Horticulture, but no one has made any suggestion as to ways and means for its accomplishment. I have given considerable thought to this subject, and am persuaded that with united effort a Home of Horticulture may be found.

"Time is of value, and none should be lost. To make a move in this matter I would venture to submit a plan for the proposed building, and a scheme for providing the necessary funds. The selection of the most suitable site is of the first importance, and I would therefore suggest that a meeting should be convened at an early date for this purpose.

With your permission, I propose very shortly to put this scheme before your readers so that they may have a comprehensive view of its details. I trust I may count upon your kind co-operation. James L. Word, Orkleigh Pack, Whetstone.

OUR ALMANACK, -Secretaries of Horticultural Societies and others, are earnestly requested to forward immediately, the dates of Show Fixtures and of Meetings of Botanical and Horticultural Societies of any kind for 1897, for insertion in the Almanack, to be published in our issue for January 2.

LINNEAN SOCIETY.-An evening meeting will be held on Thursday, December 3, 1896, at 8 p.m., when a paper will be read by Rev. George Henslow, F.L.S., &c., entitled "Does Natural Selection play any part in the Origin of Species among plants?"

SOCIETY OF ARTS' MEDALS .- At a meeting of the Society of Arts, held on November 18, the Society's Silver Medals were awarded for some of the papers contributed during the last session. Among those thus distinguished were :- Dr. D. MORRIS, C.M.G., M.A., for his paper on "Bahamas Sisal Industry." Dr. MORRIS, who has on several previous occasions favoured the Society with valuable papers and lectures respecting the fibre industries, well illustrated in this paper the importance of this new fibre plant, which is largely grown in the Bahamas. To EDWARD W. BADGER, for his paper on "Fruit and Vegetable Drying." The system of artificial drying applied to truit and vegetables is very generally adopted in the United States, and Mr. BADGER clearly showed the value to the British farmer of the system by which large quantities of fruit and vegetables may be saved in times of plenty. To G. Scott Elliot, for his paper on "The Commercial Prospects of English East Africa and British Central Africa." These territories, as a centre of British commerce, must ever be a subject of interest to Englishmen, and Mr. Elliot's useful paper on this was especially noticeable, on account of his reference to the portions of Africa which might be found to be suitable for European settlement. All these gentlemen are valued correspondents of the Gard. Chron.

NATIONAL ROSE SOCIETY. — The annual general meeting will be held on Thursday, Dec. 3, at the rooms of the Horticultural Club, Windsor Hotel, Victoria Street, at 3.30. The annual dinner is to be held on the same day and place, at 5.30 P.M.

NATIONAL CARNATION AND PICOTEE SOCIETY (Southern Section). NATIONAL AURICULA AND PRIMULA SOCIETY (Southern Section). -The annual general meeting of the above societies was held in the room of the Horticultural Club, Hotel Windsor, Victoria Street, on Wednesday, Nov. 18, a good muster of members attending. The report of the hon, treasurer shows a very satisfactory state of affairs in the Carnation Society, eighty new members having joined during the year, making a total of 305 members. Upwards of £200 were offered in prizes at the exhibition held at the Crystal Palace in July last. but owing to the unfavourable season, many classes were not filled, and but £171 was paid for prizes, leaving a balance in hand of £236. The Auricula Society numbers seventy-one members, as against sixty-eight last year. £64 was paid in prize-money, a balance of £10 12s, being carried forward. The presidents, vice-presidents, auditors, and committees, remain the same as last year, with one or two exceptions. The Rev. H. HONYWOOD D'OMBRAIN, owing to advauced age, has resigned the chairmanship of committee of the National Carnation and Picotee Society, much to the regret of the members. Mr. E. Colby SHARPIN was unanimously elected to fill the vacant post. Owing to his numerous engagements and increase of business, Mr. Douglas has been reluctantly compelled to resign the office of secretary to both societies. The loss of his services is much to be regretted, and in gratitude for his past services he was unanimously elected a vice-president of both the societies, and the following resolution was adopted with acclamation :- "In accepting with much regret the resignation by Mr. James Douglas of his post as hon, secretary of the two societies, the members desire to place on record their hearty appreciation of the devotion with which he has always striven to promote to the utmost the interests and prosperity of the societies, and to express to him their grateful

thanks for his long, faithful, and efficient vervice." Mr. T. H. Henwich was appointed non secretary and treasurer to both societies.

THE CHRYSANTHEWUM SHOW OF THE YORK FLORISTS.—The important event in the Numbern metropolis took place in the Fine Art and Industrial their own against all others. The exhibition while consisting shiefy of Chryspatheriums invited shrups Confers frus regesties and vancus table Section report to the

would be exceedingly pleased to accept the present. It is praced so the Canadian Office that the order of Connilion typics alone this year and into the 1,110,000 harrole | \$1,000 harrole have already been shipped this man to Deglari.

CHANGE OF SEX IN THE SMEET CHESTNUT In Median (Morri), is an account; and a figure of a operament of the Awker Chestman in which the make

or staminate catkins have produced pistillate flowers and ripe Chestnuts. Professor Meehan says that these cases of the development of a female flower are due to a relative excess of nutrition which determines the formation of female flowers. The catkin in the case of the Chestnut must lose its usual slender form and caducous habit, and become more or less persistent.

THE CYPRIPEDIUM GROUP.—In the current number of the Orchid Review, Mr. Rolff has an interesting and valuable paper on Cypripedium and its allies. As to the genera, Mr. Rolff makes four, thus distinguished:—

Ovary 3-celled, with axile placentas; sepals valvate, leaves plicate; perianth persistent; seeds subglobose.

Selenipedium.

leaves conduplicate; perianth deciduous; seeds fusiform.

PHRAGMIPEDIUM.

Ovary 1-celled, with pariental placentas; seeds fusiform.

leaves plicate; perianth persistent; sepals valvate.

CYPRIFEDIUM.

leaves conduplicate; perianth deciduous; sepals imbricate.

PAPHIOPEDIUM.

CHISWICK GARDENERS ASSOCIATION.—At the fortnightly meeting of this suburban body of gardeners, on Thursday, November 19 an interesting and able paper was read by Mr. S. T. WRIGHT, the President of the Association, entitled "Intense Culture," as applied to the small gardens usually attached to the better class of suburban houses.

A THANKSGIVING PUMPKIN.—The American Society in London celebrated a thanksgiving day on Thorsday by a dinner in the Grand Hall, Hôtel Cecil, at which Mr. BAYARD, the American Ambassador, was the principal guest. A curious feature of the banquet was an enormous l'umpkin weighing 175 lb. This big vegetable, after constituting the attraction of several American horticultural exhibitions, has been placed at the disposal of the American Society in London by the grower, Captain Kromer, late 3rd New York Cavalry. Schohaire co., New York State.

HIGHGATE AND DISTRICT CHRYSANTHEMUM SOCIETY.—The Secretary of this Society desires to inform our readers who are Chrysanthemum growers for exhibition, that a silver cup, valued at 10 guiceas, will be offered by Mr. Horace Regnalt at their next exhibition as a prize for forty-eight cut blooms, of which half must be incurved, half Japanese varieties, with not more than three blooms of any variety.

MORPHOLOGY OF PINE CONES. -Professor MEEHAN, in sending some specimens with leafy bracts, writes as follows: - You will be interested in some specimens of Picea Alcockiana which I send with this. It was a great struggle between the effort to make a cone and that to make a branch. I have numbers on several plants. In some cases the branch, and in others the cone, nearly wins, I think it clearly proves my conception of the morphology of the cone which I have often presented. In my first paper "Adnation in Conifera." to which the Editor kindly adverted at the time, I maintained that the onter epiderm of a Pine-branch was composed of adnate (perhaps I chould have said counate) leaves. In a subsequent paper "On the bractea in Lurix," I showed it was these leaves, becoming free in anthesin, that formed the bractea, and the buds developed from the axis usually producing the phylloidal branch, or needle. I believe my views are now generally accepted, and these specimens confirm them. Other interesting questions are involved. Though perceiving that environment has to do with the modification of form to some degree, I have never felt the facts warranted

the conclusion that it was any great factor in the evolution of species. This I would refer to varying degrees of internal energy. The mere accident of environment seems out of place in a methodical system where so many things must work together in harmony for the machine to go at all. But there are at times strong facts in favour of changes in plants from environment to a degree that we regard as specific. From my own researches, 1 am satisfied that Pinus fallax, and Picea pungens of the Recky Mountains, have changed from the original Pinus ponderosa and Picea Menzicsii, and that this change occurred solely from the sudden elevation of the land. Still, these changes are slight. Indeed, many regard the four forms but as two species, for all the many ages since the conditions were changed. The present specimens of P. Alcockiana are certainly due to conditions of environment. There are about a dezen plants, from 2 to 3 feet high. Transplanted in the spring of 1895, it was with difficulty we got them through the drought and torrid heat of that exceptional season. The growth was but an inch or two. Other species of the order, planted with them, died absolutely; the vital force was certainly very low. I have shown that there must be a check on exuberant vital energy before the female element in vegetation has a chance to exert its power; and a still greater check before the male element has any show at all. In the case of this Picea, the "enviroument' had sufficient influence to control the vegetative energy to some extent. My paper on the "Relative Characters of Allied European and American Species of Trees," confounded Mr. Darwin, as he frankly admits in his Domestication of Plants and Animals. But I think I can now see that a change in a single particular may so divert the current of life-energy, that by mere mechanical law other changes must of necessity follow. For instance, the more dense and compact growth of the European Linden, as compared with the American Linden, may be fairly referred to the different lengths of the growing season. But the density or laxity, once acquired, the arrest or development of other parts of the plant would be a natural consequence of diverted energy; and the manifestations would, also of necessity, be in precisely the same lines in any tree under the same original environment. The uniformity in these relative characters which struck Mr. DARWIN, myself, and others, as so remarkable, would now seem to be remarkable if they were not so. At any rate, it seems clear, that if the conditions of environment prevailing in 1895 should continuously operate on Picea Alcockiana, we should have a permanently dwarf and very distinct form.

NOVELTIES. — Messrs. James Carter & Co. forward to us a list of about 150 varieties of flower-seeds introduced for the first time by their house since 1857. Some of the flowers are of Californian origin, and were originally made known to botanists many years before by Douglas. Others are the result of long and careful selection at the hands of Messrs. Carter. In some years only two or three novelties were introduced, whilst in 1868 no fewer than fourteen varieties were offered. Certainly Messrs. Carter may claim to have made our gardens brighter than they found them.

CATTLEYA LABIATA. — Mr. Moore, obligingly sends us from Glasnevin a flower in which the two lower sepals have assumed the yellow markings in the centre of the disc, which is found in the lip. From the same source we have a flower of Cattleya superba, in which the lateral petals are concrescent with the column, thus altering the whole appearance of the flower.

CHRYSANTHEMUMS AT ANTWERP.—The Antwerp Royal Horticultural Society organises, at each of its Chrysanthemum shows, special classes for specimens more than a year old. I this year noted the following plants sent by M. VERMEULEN:—Souvenir de Toulon, plant 6½ feet across, seventy-five flowers measuring nearly 8 inches; Amiral Avellan, with fifteen blooms nearly 8 inches across by $5\frac{3}{4}$

inches high; M. Benj. Giraud, plant over 3 feet high, nearly 2 feet above the pot, with 100 flowers measuring nearly 4 inches across; Col. N. B. Smith, with fifty flowers nearly 8 inches across; Reine d'Angleterre, with fifty blooms 94 inches across; Madame Taulier, plant nearly 5 feet across, 75 flowers 5 inches across; Florence Davis, plant about 5 feet in diameter, seventy-five blooms nearly 6 inches across; M. Ad. Girand, plant 5 feet 8 inches high, 24 feet above the pot, with sixty flowers 71 inches across; G. W. Childs, plant over 3 feet across and in height, pot included, with fifty flowers measuring 93 inches; William Seward, plant 3 feet high, bearing fifty flowers 71 inches across; Mrs. Irving Clarke, with thirty blooms 101 in. diameter, nearly 6 inches high; and M. Demay Taillandier with thirty flowers 97 inches across and 61 inches high. The favourite varieties in Antwerp are: Mrs. Dr. Ward, Aida, Kentish White, l'International, Silver King, President Armand, Reine d'Angleterre, M. Ch. Molin, Louis Voraz, M. Max. de la Rochterie, Madame Carnot, Mr. H. F. Jones, and Irving Clarke. Ch. D. B.

WINCHESTER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—A lecture was given on Tuesday, November 17, by Professor Gilchrist, B.Sc. (in connection with the Agricultural Department, University College, Reading), on "Soils and Manures." Prof. Gilchrist showed on a map the different kinds of soil in the district and in various parts of the country, but dealt chiefly with the soils of the district and how to treat them. He also stated what some kinds of soil were deficient in, and what to apply to them, especially in cases when iron, magnesia, and lime, were needed. The application of lime, and its uses, were dealt with, as well as different kinds of manures, and the crops they were most suitable for.

SCIENTIFIC HORTICULTURE.—The third expedition of the American Society for the Premetion of Scientific Horticulture is [was] on the southern slope of the Himalaya mountains, to which positiou it has worked its way from the Island of Formosa during a year and a half. The search for Orchids is the principal object of the expedition. Besides Orchids, however, a number of fruit, ornamental trees, vegetable, flower, and other seeds have been collected which the society proposes to distribute free to any oue interested in the subject of horticulture. The general object of the expedition is to obtain some seeds of the remarkable vegetation of Asia, and theu to acclimatise them to the climate of America. Some of the most enthusiastic members of the society expect, by grafting, to produce a variety of new fruits from the combination of our domestic and the foreign specimens. The party is in charge of Professor JAMES A. CRADDOCK, M.A., Ph.D., the pomologist of the society. He has four young men with him. The expedition has been exposed to the usual dangers of trans-Asiatic travel; it has had encounters with the natives of the countries through which it has passed, and has braved the fever that lurks in the night air, not to speak of the insect pests. George C. Asper, the secretary of the society and organiser of the expedition, lives at 410, West Forty-seventh Street, New York City. He is a member of the firm of GEORGE C. ASPER & Co., the proprietors of the Mehawk Valley Nurseries, at Schenectady, N.Y., and a similar establishment in California. He is considered an authority on horticulture, being a botanist, pomelogist, and entemologist. He is delighted with the evident success of the expedition, which he declares is the most succe-sful of any the society has sent out. The expedition now in Asia left New York in March, 1894. It proceeded to Yokohama, Japan, from San Francisco. The work of research was begun in Formost, and continued there for several months. Specimens received from there are of great beauty. The American Society for the Promotion of Scientific Horticulture was organised fourteen years ago. The officers are: - MAXIMILIAN DURAND, President; George C. Asper, Secretary; James Crad-DOCK, pomologist; D. MONTGOMERY LIDDELL, M.A. Ph.D., entomologist. Extract from the "National Nurscryman," Rochester, New York.

NUTRITIVE VALUE OF THE HORSE-CHESTNUT. -M. PAUL GAY contributes to the Annales Agronomiques for Sept. 25 a paper on the "Nutritive Value of the Horse-Chestnut," and the results of his experiments in this direction are summed up in the following terms:-" 1. Horse-Chestnuts possess an alimentary value at least three times more than that of the richest forage Beet-roots. The agriculturist can, after this statement, calculate the actual value of these fruits according to the economic conditions under which they are found, and he will see if it be wise to use them after he has estimated the total cost necessitated by collecting the harvest. 2. Horse-Chestnuts, when cooked, have an alimentary value far exceeding that of the raw Chestnuts. 3. Horse-Chestnuts are readily eaten by cattle; further, they havo no injurious influence over the richness and quality of the milk. Calves feed on this milk without unpleasant results. 1. Pigs show a marked dislike to this food; it must not then be thought possible to utilise it for feeding these animals. This question of the value of the Horse-Chestnut for feeding stock seems to us now completely answered. Advocated and employed for a century and a half, its use could not be made general owing to a popular prejudice, which attributed to it violently poisonous effects. We will hope that recent scientific research made in this direction, and knowledge of the alimentary value of this food, will dispel the foolisl. belief, and that henceforth agriculturists will decide to utilise a product so little costly and so long misjudged.

EFFECT OF CERTAIN BACTERIA UPON LEGU-MINOUS PLANTS .- According to the Annales Agronomiques for Oct. 25, the chief conclusions chronicled by F. Nobbe and L. Hiltnen in their recent publication as to the effect of certain bacteria upon different varieties of leguminous plants, are as follows: - "The experiments furnished a very decisive result; they showed, in fact, clearly, that the beneficial action of bacteria on the development of plants is only surely felt when the plants are inoculated with the particular bacterium peculiar to the species. As a rule, there can be no substitution for the special bacteria of the plant under consideration of a bacterium from another species without considerable impairment of the action of these micro-organisms. The same expements showed further: (a,) That the tubercles of leguminous plants remain without influence on the development of the aerial part of these plants, as long as the soil itself furnishes nitrogen in sufficient quantity. (b.) That, from the moment when the nitrogen of the soil begins to fail, plants that have no tubercles, or which are furnished with insufficiently-formed tubercles, cannet supply the required amount of nitrogen, and the leaves of leguminous plants in especial cannot be regarded as organs capable of assimilating the free nitrogen of the atmosphere. Soil is fertile only when duly aerated and in a moist condition. Air is necessary for the germination of seed; for the respiration of roots, it oxidises organic matter. This combustion results in the production of carbouic acid, which dissolves the lime and keeps the soil permeable. It burns up the ammonia under the influence of the ferments (microbes), and induces the formation of nitrates. the most powerful elements of fertility. Water is equally indispensable; in dry soil germination does not take place, or, if when the plants are raised drought supervenes, the young plants languish and end by dying. When the plant has formed its first leaves, they are submitted to the action of solar radiation and give off by transpiration a considerable quantity of water: if the roots are not supplied with well-watered soil, the leaf loses its turgescence, ceases to absorb earbonic acid from the air, and to form vegetable material. In dry soil the ferments remain inert, the nitrates are no longer formed. the plants are ill nourished, develop rapidly, quickly ripen their seed, but the crop is indifferent. The two primerdial conditions of plant-life are, therefore, the aeration of the soil and its moisture." "Sur le Travail du Sol," par M. P. P. Dehérain, Annales Agronomiques, October 25, 1896, pp. 449, 450.

TOMATOS.—The Connecticut Experiment Station Report, 1895, states that—1. A foreing-house Tomato crop yielding about 2 lb. of fruit for each square foot of bench-room, takes in the bines and fruit, for every 109 square feet of bench-space, not less than—

Of this from a fourth to a fifth only is in the bines.

2. To enable the plants to get these fertiliser elements as required, there should be a large excess of them in the soil, perhaps double the quantity given above.

3. Every 100 lb. of Tomato fruit takes from the soil approximately

1. It is possible to grow a crop of forcing house Tomatos, amounting to 2 lb, or more per square foot of bench-space, perfectly normal in size, colour, taste, and chemical composition, by the aid of commercial fertilisers alone, and in soil composed of coal-ashes and peat.

ARALIA CHINENSIS—It is comforting to know that the plant commonly called in gardens Dimorphanthus mandschurious, may beneeforth with propriety, be called by the more euphonious name which heads this note. According to Dr. Harms in an article on the genera Aralia and Panax contained in the twenty-third "Band" of Engler's Bottonische Jahrhucher, the following specific names are also synonyms. A canescens (Siebold & Zuccarini); A. clata (Seemann); D. clatus (Miquele; A. mandschurica Maximowicz), A. Planchoniana (Hawe). A. spinosa is considered to be distinct

NATIONAL CHRYSANTHEMUM SOCIETY. - The general committee met at Anderton's Hotel, Fleet Street, on the 23rd inst. Mr. B. WYNNE, in the Chair. The secretary submitted a report respecting the recent Jubilee show, and some correspondence relating thereto, some extra prizes awarded by the judges being confirmed A report was presented from the schedule sub-committee recommending that the usual October Exhibition should take place on October 12, 13, and 14; the November Exhibition on the 9, 10, and 11; and the early Winter show on December 7, 8, and 9; the fixture of the usual Early show in September was postponed. The foregoing recommendations were confirmed. Twenty-two new members were elected, including one Fellow, and the secretary stated that 182 candidates for member ship had been elected since the commencement of the

NATIONAL DAHLIA SOCIETY. - The annual meeting of this Society was held at the Horticultural Club, Hotel Windsor, on the 24th inst., Mr. E. MAWLEY, Chairman of the Committee, presiding, the leading Dahlia cultivators and exhibitors being well represented. The annual report, which was read by the Hon. Secretary, Mr. T. W. GIRDLESTONE, set forth that if the number of bloomsshown at the Crystal Palace last September was less than usual, and especially of the Cactus varieties, it was not to be attributed to any diminution of zeal on the part of Dahlia growers, but to the abnormal character of the season. as an almost rainless spring and summer prevented the plants from making their natural growth at the usual time, even when the plants were well watered; and then the rain coming just when the plants should have bloomed, they instead started into growth as vigorously as to promise to flower indefinitely, many being in full growth when the show was held, and some growers were unable to exhibit in consequence. If the extent of the show was below the average, yet fine quality was displayed in the flowers. The class for a vase or epergne of Dahlias for decorative purposes was a pronounced success, and formed an excellent addition to the dis-

play. The cottagers' and amateurs' class was not so satisfactory as could be desired, as the persons who exhibited were not those it was hoped would have been attracted; what was desired was new competitors or beginners in Dahlia culture. It would, perhaps, prove more useful in this direction if the class was reserved for those who had never before won a prize at the show. The report concluded by giving a list of the varieties of Dahlias certificated at the last exhibition; and by expressing thanks to the donors of special prizes. The financial statement showed receipts from all sources, including the balance in hand at the beginning of the year, amounted to £142 198, 1d., and the entire expenditure, including the payment of prizes awarded at the Crystal Palace, to £134 8s. 9d., a balance in hand of £8 10s. id. being carried forward. The list of Cactus Dahlias was revised, such varieties as Beauty of Eynesford, Countess of Raduor, Henry Cannell, Kyncrith, Lady Henry Grosvenor, and Viscountess Folkestone, were struck out as being of inferior form, and the eight certificated varieties of the present year-viz., Iona, Mrs. Gordon Sloane, Mrs. Leopold Seymonr, Starfish, Keynes' White, Cycle, Fantasy, and Charles Woodbridge added. It was resolved to drop the term decorative from the schedule, there being now so many fine varieties of the true Cactus type. It was announced that the annual exhibition would take place at the Crystal Palace on September 1 and 4 next. The Rev. Chas. Filliage of September 1 and 1 2000. The Vice-President and committee, Mr. E. MAWLLY was re-elected Hon. Treasurer, and Mr. T. W. GIRDLE-STONE Hon. Secretary. Separate classes were made for a vase of Dahlia blooms, and for an epergne, both designed to show the decorative value of the flower, foliage and grasses being added. It was also resolved to create two new classes for six blooms of one variety, viz., white and red. A resolution was unanimously passed, requesting the Council of the Royal Horticultural Society to arrange for a meeting of its committees about the middle of September, as at that period of the year a good many scedlings are in the best condition. The proceedings closed with a hearty vote of thanks to the Treasurer for his services in that capacity, and for presiding; and also to the Secretary.

SHIRLEY AND SURROUNDING DISTRICTS GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.—The monthly meeting was held at the Parish Room, Shirley, Southampton, on Thursday, the 19th inst., when Vice-President T. G. HARFER, Esq., presided, there being a good attendance. Mr. E. T. MELLOR, B. Sc.,, London, Lecturer in Biology, Hartley Institution, Southampton, gave a lecture ontitled, "Plants and Air," illustrated by chemical experiments and diagrams. The exhibits included cut blooms of Chrysanthemmus and a few plants.

LOUGHBOROUGH AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION. This newly-formed Association, of which W. C. Bunner, Esq. (head of the firm of Messenglas & Co. is President for the ensuing year, held their first meet ing on Tuesday, November 17, in the Cooperative Rooms, Woodgate. Mr. A. HAMSHIEE, presided. There was a good attendance of members present to hear Mr. English of Kingston Hall Gardens read his paper on "Makeshifts in the Gardon," which was well received, other members stating their views upon the subject-matter brought before them. A unanimous vote of thinks was accorded Mr. Execusin for his paper. It is mtended to hold fortnightly meetings during the winter months, and monthly meetings in the summer. The committee have met with much encouragement, already they have six "Vice-Presidents," and a list of nearly fifty members. On December 1, Mr. A. Ham-SHIRE, of Leaumanor Gardens, reads a paper on "Grape-Vine Culture. December 15, Mr. A. J. WILLSHER, The Gardens, Stanford Hall, on "The Carnation." Mr. D. ROBERTS, gurdener at Prestwold House, is the Hon. Sec.

EUCALYPTUS CALOPHYLLA.

A HEALTHY young tree of this handsome Gum-tree has lately flowered freely in the temperate-honse at Kew. It was planted out in a bed of peat at the south end of the house about three years ago, and it has grown with exceptional vigour, Eucalypti generally growing spindly and weak in this house. E. calophylla is one of the most ornamental of the hundreds of species known. I have seen large examples of it in South Africa, where it is grown in gardens, and also as a street tree; it was also recently noted in Garden and Forest as one of the most beautiful of the Eucalypti grown in California, where it endures several degrees of frost. It forms a sturdy, leafy, pyramidal tree fig. 113, and flowers when from 12 to 20 feet high, the flowers being borne in crowded clusters on the young branches, each flower consisting of a green woody cup-like calyx, and a brush-like cluster of white stamens 2 inches across. The leaves are ovate lanceolate, about 5 inches long, bright green, with a whitish margin, the midrib, petiole, and bark of the young branches being bright red. The species was introduced to Kew by Allan Cunningham from King George's Sound, where it form an immense tree. It flowered at Kew for the first time in 1843, when an excellent figure of it was published in the Botanical Magazine under the name of E. splachnicarpon. The wood of this species is said to be of considerable value, being hard, close-grained, and finely veined. W. W.

HOME CORRESPONDENCE.

ABNORMAL PLANTS. — At one of the recent meetings of the British Association at Liverpool, the discussion which followed a paper on certain features of Fern reproduction, the objection was raised that, as the examples brought forward were abnormal, they were not a fit subject for strict argument as to the origin of alternation of generation with which the discussion dealt. Now, considering that in these abnormal types we have a very large number of plants which, for no reason that we can determine, have broken away from the usually hard and fast lives of the species, not merely in outward form, but also in the very important matter of their mode of reproduction, it seems to me that this objection, if recognized, would close a field of research which is especially likely to yield fruitful results. In the first place, among these abnormal forms which have received the extremely unscientific name of "monstrosities," we have examples of sudden and persistent absurge of type which were examples of sudden and persistent absurge of type which were examples of sudden and persistent absurge of type which were examples of sudden and persistent absurge of type which were examples of type with the sum of type which were examples of type whi sistent changes of type, which mean nothing more nor less than the appearance of new species in so far that they differ much more widely from the specific type than many species do from one another. second place, to confine study of the morphological side of Ferns to the normal varieties is to pick out those whose life cycle is known, and to ignore precisely those which have broken through the standard regulations, as it were, and are therefore the most likely, by their varietal character, to show loug lost ancestral traits as well as fresh modificatious of existing ones, since every cultivator knows that ouce a "break" is made, the progeny varies both ways. Suppose, for iustance, a case of complete reversion to antique type supplying the missing clue the origin of alternate generation were found, this being a solitary plant, would rank as an abnormal form of some species, and be disqualified for scientific consideration. The "sports," "freaks," "monstrosities," are all pursuing certain laws of growth, of which practically nothing is known, and inasmuch as in Forus more particularly, they are the product of purely natural conditions, being mainly wild plants, surely it is not well to discourage research because they present unusual features. Of late years, the study of abnormal Ferns has resulted in several discoveries of interest, which go far to elucidate precisely the difficulty presented to biologists by the alternation of generation. We know now of at least one Fern (Lastrea (Nephrodium) Pseudo-mas cris-tata) which reproduces itself freely and constantly from spores without any sexual agency whatever. This was Professor Farlow's discovery of Apogamy, and is not peculiar to that variety or species. withstanding this faculty, however, this Fern has not lost that of further variation, and in one of its progeny, identical in form with itself, it was found that it was capable of producing prothalli on its young fronds without the agency of the spore. An independent sport is now in my possession in which this faculty is persistent, so that the frond becomes simply a stage of the prothallus life. The prothallus produces a bud which develops into a stalked prothallus, with a basal bud for primary frond; as the later fronds increase in size, they assume the usual cellular structure of stipe and frond, a necessary condition for their size, but this cellular structure thins out at the edges and terminals into that of the probablus again, and upon these, hnds are speedily developed if brought into contact Query No. 1-Where is the alternation of generation here? And query No. 2—What is the use of the complicated arrangement of archegonia and antheridia when the whole business is thus completed, and robust plants result. and are perpetuated without them? Chas. T. Druery, F.L.S. Query No. 3-ls not too much stress laid upon the so-called alternation of generations! And query No. 4—Are not the phenomena witnessed the result of adaptation of the old generation to new circumstances or requirements rather than to an entirely new generation? Ep.]

TREES AT DUFFRYN.—A place situated in the immediate centre of a coal-mining district, as is Duffryn, Monntain Ash, the Glamorganshire seat of Lord Aberdare, is scarcely the situation in which gardens of much interest are likely to be found. On a recent occasion in company with Mr. Pettigrew, gardener at Cardill Castle, I was conducted through the grounds by Mr. Davies, Lord Aberdare's headgardener, we saw, amongst other interesting things, some fine trees which appeared to me to be worthy of note. The most conspicuous of these was a common Cherry, which is said to be the best specimen of its kind in Wales. Be this as it may, I can reiterate Mr.

Pettigrew's remark upon seeing it, "It is the finest Gean I have seen;" and Mr. Davies informs me that its total height is 82 feet, and its girth at 3 feet from the ground is 8 feet 2 inches. Its bole is as straight as that of a Larch, and it measures 35 feet to the first branch, while the bark is without blemish—a good criterion that the soil at Duffryn suits the Cherry. A common Holly, in robust health, cone shaped, with its bottom branches sweeping the turf ou which it stands, and its whole surface thickly beset with clusters of berries, next drew our attention. The clusters of berries, next drew our attention. Ine diameter of the lower branches is 58 feet, and its height is 30 feet. A perfectly-formed tree, with dense foliage like this one, particularly in winter, when thickly furnished with its ripe fruit, is an object of great beauty, rivalled by few, if any other branches are tree of symmetrical shape. shrubs. Another prominent tree of symmetrical shape, and about 18 feet in height, and as much through, with its bottom branches touching the turf, standing upou a sloping lawn, backed up by evergreens, which considerably enhances its beauty, proved to be Crategus orientalis, remarkable for its downy twigs, peculiarly-cut foliage, and large bright red haws, which are pro-duced in abundance. Thorns of this type appear to duced in abundance. Thorns of this type appear to be neglected, while Paul's Scarlet, and other showy be neglected, while Fall's Scarlet, and other showy flowering varieties, are being commonly planted instead. Each class, however, has its characteristic beauty, and is equally deserving of the planter's attention. Cotoneaster frigida, upwards of 25 feet in height, and thickly bemantled with its pretty berries, was another conspicuous plant. This is also part or proposental in the autumn and in december. was auother conspictous plant. In it is also very ornamental in the autumn, and is deserving of more attention thau it generally receives. Another tree deserving of mention is a large Birch, possessing unusually wide-spreading branches, which extend 29 yards in diameter. It may be of interest to mention that Osmunda regalis thrives here along the natural rocky margin of a stream, where it is indigenous, and assists considerably to make a pretty feature. Thomas Coomber.

NEW VARIETIES OF TOMATOS.—The past few years have brought us a great many new varieties of Tomatos, and although sometimes one makes a trial of some of these, and obtains one which is better than what has been hitherto grown, there are many gardeuers who will have met with disappointment in regard to the lightness of the crop of fruit obtained, probably by reason of the new variety setting its flowers badly. I would therefore suggest that no new Tomato be awarded a Certificate, or any award, unless it is exhibited of good size in flower-pots, asy, of 8-inch diameter, not less than three pots, as by so doing the judges will be better able to gauge the setting of the blossoms. The true character of the variety will be thus determined, and a more correct estimate be formed of it than is possible from dishes of fruit. Experimenta.

RARE CONIFEROUS TREES.—Probably nowhere in the British Isles are there larger or healthier specimens of the rarer Conifers than within a short drive of the shores of Lough Neagh, in the county Armagh, Ireland. There the Fitzroya. Podocarpus alpina, Athrotaxis selaginoides, Cephalotaxus Fortunei, and a variety with round berries about the size of ripe Oak-apples (See Gardeners' Chronicle, Jan. 26, 1884, var. sphieralis); Pinus Bungeana, P. Jeffreyi, Ahies magnifica (true), A. lasiocarpa, Juniperus drupacea, Cupressus obtusa, C. Goveniana, C. Lindleii, Torroya californica, and L. nucifera have attained to large dimensions, and wear a healthy appearance that quite charms the lover of these interesting species. A. D. Webster.

UTRECHT.—At present we have in the propagating-pit very nice plants of Anastatica hierochuntica, the Rose of Jericho, remarkable that it would not grow in soil from Arabia. Leaf-mould, with river-sand and a bit of clay, is the best for them. They remain in flower for some time, but the flowers are very small. J. K. Budde.

ARAUJIA SERICIFERA AS A MOTH-TRAP.—Will "Riviera" pardon me if I point out to him that his description and drawing of the method by which this plant catches moths and other insects, as given on p. 523 of this volume of the *Gardeners'* Chronicle*, is quite inaccurate in certain particulars, and I do not think he can have observed the actual position of the proboscis whilst held by the flower, or he would have seen that the position of the proboscis between the pollen masses as represented in the diagram A, B, C, is quite an impossible one. The structure of the flower, so far as the staminal part is concerned, is as follows: the five anthers are attached to the dilated part of the style, in the manner common to all Asclepiads, and form a short pentagonal cone around it. The margins

of the anthers are broad, hard, and horuy; they are contiguous to one another, and somewhat projecting outwards, so that between each pair of authers, and formed by them, is an almost closed fissure, but slightly gaping at the base; behind the fissure is the stigmatic cavity, and seated at the apex of the fissure is a miuute, blackish, horny body (the pollen carrier), with a chink down its outer face directly continuous with the fissure between the anthers, and to this horny body are attached by little stalks the pear-shaped pollen-masses, one on each side of it. These poller-masses hang down in the pocket-like cells of the anthers, one mass in each cell, and the cells are separated from each other by a solid partition, so that it would be quite impossible for a moth to insert its proboscis between two pollen-masses, as shown in the illustration, for the remarkable part of the structure of the pollen-apparatus of this and all other Asclepiads is, that one of the pollen-masses attached to each of the little horny bodies belongs to one anther, and the other pollen-mass to another anther. I have never seen insects entrapped by this plant, but I have no doubt it takes place very much as in other Asclepiads; thus, the moth in sucking up the uectar gets its proboscis inserted in the wedge-shaped base of the fissure between the anthers, and, in withdrawing it, it is pulled farther and farther up the fissure, and is held more and more firmly by the pressure of the horny, elastic anther-wings, and the moth is often unable to escape from their grip. Should the moth succeed in pulling its proboscis quite up to the apex of the fissure, it then enters the chink in the little horuy body to which the pollen-masses are attached, by which it is again clasped tightly; but then the insect finds little difficulty in pulling this body away from its seat, and with it the pollen-masses from their cells, and flies away with them. The horny body is never in the least glandular as described in any Asclepiad, but, on the contrary, is usually very smooth, and often highly polished; in the plant in question it is rather opaque. N. E. Brown. [The illustration was a faithful reproduction of the head and proboscis of the moth as it reached us. Ed.]

APPLEY TOWERS AND LADY HUTT GRAPES.—In answer to your correspondents, p. 599, I may state that I have these varieties grafted upon a Vine of Gros Colman, Appley Towers on the top, and Lady Hutt on the first spur on the bottom of the Vine. It was interesting to watch the progress of these three varieties of Grapes on the same stock. The fruits of Appley Towers and Lady Hutt were colouring nearly a month before Gros Colman showed any signs of colour. The ability to haug on the Vine in good condition was as good, if not better, and the flavour superior to that of Gros Colman, and I am sure that when they are better known they will become popular varieties for winter consumption. A Vine of White Colman, growing in the same house, is a very poor kind of Grape, and not to be compared with Lady Hutt. One of your correspondents remarks upon the northern gardeners' notion of placing Gros Maroc before Gros Colman; but we find that Gros Maroc, in the month of September, is much superior to Gros Colman—and as a proof of this I may mention that it was put first in the "any other Black Grape" class at the Edinburgh show held last September, beating Muscat Hamburgh and Madresfield Court. What do correspondents of the Gardeners' Chronicle say to that A. Kirk, Norwood, Alton, N.B.

——We have these two varieties of Grapes growing together in a vinery with the Black Alicante, and so far the former has not had the good quality attributed to it by some of your correspondents. This poorness of flavour may possibily be due to the Vines not being inarched on others. Lady Hutt has pronounced Sweetwater flavour, but berries and bunches are vetter than those of any Sweetwater. The Vines might do better in a late vinery than an early one. The vinery our Vines grow in was started in December last, and Lady Hutt ripened first, and then Appley Towers, which was ripe fully three weeks before Black Alicante in the same vinery; the roots of the Appley Towers Vine being outside, and those of Black Alicante inside the vinery, which is more in favour of the earlier ripening of the fruit of Appley Towers. I should say that the latter would succeed if planted along with Black Hamburgh in a vinery, as if required the fruit would then haug longer than the Hamburgh, and give an extension of the supply; and I find that the fruit is better for hanging some time after it is ripe, the skin being then less tough, and the flavour improved. I may add, that this season the fruit of Dr. Hogg Vine has been good in size of bunch and in flavour, which was

decidedly musky. Apparently this variety would be a suitable one for cultivating in a coel house, where Muscat of Alexandria would not answer. T. H. Slade.

A HORTICULTURAL INSTITUTE.—Most readers of Mr. R. Dean's letter in the Gardeners' Chronicle of the 21st inst., will admit that he made out a good case against this project. Many of us are well aware of the fact that he considers no place for the National Chrysanthemum Society can equal the Aquarium. I only wish he would make up his mind that the place was a most unsuitable one for a flowershow, and he would really endeavour to get a better one; then there would be some chance of the National Chrysanthemum Society holding its exhibition in a place which would do the exhibits credit. I doubt whether any other Society in the w-rld of any pretentions holds its exhibitions in such a very unsuitable place. The Aquarium has little else besides size to recommend it, and it has much against it; for one thing, the light could hardly be worse, and on the second day of the show you could hardly see the colours of the flowers for the dust from the floor, and the shower of wet filth which drops from the roof. Then, again, all those sideshows, with the everlasting cries of "Pass this way, please, to see," &c.; "Just about to commence;" "Have you seen the Great Mystery?" &c. These cries are howled from all quarters. Undoubtedly, the throe days of each of the four shows held by the

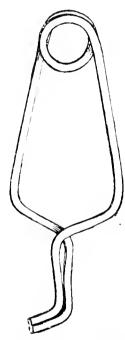

Fig. 114. A CLIP FOR SUSPENDING GRAPES AND PEARS.

National Chrysanthemum Society are a great help to National Chrysanthemum Society are a great help to the Aquarium receipts; in fact, the third day of each show may be said entirely to favour the Aquarium, for the exhibits are no credit to anyone, what with the dirt and parching heat. Mr. Dean makes much of the large amount of space required, but I, with many others, fail to understand what Apples, Pears, and other fruits, Potatos and other vegetables have to do with Chrysanthemums and the National Chrysanthemum Society. We hear a great deal about the over-worked secretary and committee, and the want of time ou adjudicate to varieties of Chrysauthemums which would be put forward for certificates; and yet these vegetables, &c., are added, which require quite one half of the large amount of the tabling used. One exhibit of Potatos iu particular ran quite across the large hall, and consisted of large heaps of tubers which in the aggregate could not weigh very much less than a ton. majority of visitors pay very little attention to the vegetable exhibits. The cut blooms of Chrysanthemums are always the primary attraction. Let us stick to our last, and the tables will not require so much space when packed away. Of course, it is very kind of the anthorities to lend the Aquarium for show purposes, but I should like to see the National Chrysanthemum Society, that is, the exhi-bitors, considered more than they are, and the coffers of the Aquarium a great deal less. M. U. M.

MICHAELMAS DAISIES IN POTS AT KEW. -There is not the least doubt that these hardy perennials will in the future be cultivated in pots for the further embellishment of the greenhouse. At p. 600 of a recent issue allusion was made to the subject, and as a succession of these plants have flowered under glass at the Royal Gardens, Kew, this year, a further note may not be out of place. It will, I think, be admitted that there is room for a selection of these plants, particularly of the varying shades of blue, a colour not very abundant at this season. These plants are also suited to a variety of purposes, while the flowers that are produced under glass are very pretty for culling for filling vases, &c. Lately at Kew, in the Camellia section of No. 4 House, a charming lot of Aster grandiflorus was noticed. This is not only the largest-flowered, but also one of the most beautiful. The plant forms a branched bush abou 2 feet high, and was surmounted with numbers of its blue starry blossoms about 2 inches across. To be able to get this variety to flower in a cool green-house in the middle of November is well worth the trouble, particularly as it is a species which rarely expands its flowers in the open air, and for several years in succession well-established plants iu a light well-drained soil have scarcely perfected a flower owing to frosts occurring in October. One of the prettiest varieties noted at Kew was A. turbinellus, plants of which were arranged in a group; the flowers are produced on slender wiry stems. This dumosus, well suited to small pots, and forming compact bushes 9 inches high. A. lavigatus has compact bushes 9 inches high. A. lævigatus has masses of rosy-lilac blossoms, and it stands about 20 inches high—very pretty and delicate-looking. The varieties of A. cordifolius are pretty, viz., C. albulus, C. Diana, and C. elegans, also A. ptarmicoides superba, the ray-florets of which are pure white; A. lævis arcturus, with flowers of rosy-lilac and blackish stems. Others suitable for pots are A. sagittifolius, with light blue flowers, and A, Novi-Belgii densus, though just a little stiff, may be included for its fine blue shade. The chief point to aim at is a succession of flowers. The chief point to aim at is a succession of flowers from the middle of September, as up to this date the earliest forms expand equally well out of doors, and of course much later if frosts keep away. Where an extra good effect is desired, the plants may be allowed to grow unchecked, potting some well-reoted pieces in February or March in good ordinary soil, and plunging them a good distance apart in the open. By stopping or pinching, the bushes may be increased By stopping or pincaning, the business may be increased in size, while the sprays come in greater numbers if of smaller size. If a plant be found to be too tall, it may be cut down the first week in June to within 6 inches or 1 foot of the pots. Where height is no detriment, a system of pinching early in May, and again in Juue, will cause the plants to become bushy. J.

NEW INVENTION.

CLIP FOR SUSPENDING GRAPES AND PEARS.

In the Vine districts of Switzerland, the contrivauce shown in fig. 114 is used to suspend bunches of Grapes so that they may be kept free from bruising or other injury. By pressing in the middle the two sides of the wire-loop, the clip at the lower end opens, and the stalk of the bunch being inserted, is held firmly. The clips are made in various sizes, of galvanised wire of varying thickness. We find those of the size represented above as amply sufficient to suspend Pears. Their use in the fruit-room, or to suspend bouquets, is obvious.

COLONIAL NOTES.

"WESTERN AUSTRALIAN YEAR-BOOK."

The ninth annual issue of this publication, for 1894-5, is now to hand. Among the contents is an account of the discovery and history of the district, also a record of the climate, geography, and constitution of the various districts from the earliest to the present time. The industrial and other capabilities of the colony are mentioned. Among the most interesting contents is a treatise from the late Baron Ferdinaud von Mueller, on "The Vegetation of Western Australia," followed by a classified list, from the same pen, of Extra-Tropic West Australian Plants, many of which are well adapted for culture in this country. These contributions are yet another proof of the industry and knowledge shown by Baron von Mueller in the many branches of his favourite science.

LAW NOTES.

THE EXTRAORDINARY ORCHID DISPUTE.

JUDGMENT.

In the City of London Court on Wednesday, Mr. Commissioner Kerr delivered judgment in the ease of Rappart. Peat and Dillon, which was before him some time ago, and which raised questions of peculiar interest and importance to Orchid growers and others. The plaintiff, Mr. David B. Rappart, The Promenade, Liscard, Cheshire, sought to recover against the defendants, Mr. W. B. Peat and Mr. Malcolm Dillon, executors of the late Mr. G. D. Owen, 24, Grosvenor Road, Newcastle-on-Tyne, the return of the sum of £17–68, 6d, which he had paid to them for certain Orchids, Mr. J. G. Pease was council for the plaintiff, and Mr. Edwin Pollock for the defendants.

The plaintiff's case was that he attended the sale of the Selwood collection of Orchids, which was held at Selwood, Rotherham, Yorkshire, on April 24, 25, and 26 of last year, when the late Mr. Owen's fine collection was disposed of by auction. He purchased Orchids which were not, as he asserted, of the rarity represented, and he now wanted his money to be returned as a mistake had been made. He bought an Odontoglossum elegans, a Dendrobium splendidissimum grandiforum, and a Cattleya Skinneri alba. For those he paid £17 6s. 6d. The plants were not in flower when he bought them, so it was impossible to tell whether the plants really answered the descriptions contained in the catalogue upon which he purchased. When the plants flowered, the Odontoglossum turned out to be a Halli (worth 2s. 6d. instead of the 5 guis, he had paid, the Dendrobium proved to be an Ainsworthii worth 2s), and the Cattleya Skinneri alba was not an alba at all, but quite an ordinary variety. As a mistake had been made somewhere, he asked to have his money returned

The defendants' case was that the plaintiff had purchased, as a fact, what the defendants pretended to sell him. The late Mr Owen had seen the Orchids in flower, and when he bought them, Mr. Owen paid turns far in excess of those paid by the plaintiff. The plaintiff must have mixed them up in some way or other. There could be no doubt that the defendants sold the plaintiff the gennine plants, and not the common varieties which was now alleged.

Mr. Commissioner Kerr, on the last occasion, said there was no allegation of mula fides on the part of anyone; but as the case presented so many difficulties, he would take time to consider his decision. He now gave judgment. He said the case had given him more trouble than any action had involved for a long time past. He could not satisfy his mind that he ought to give judgment for either plaintiff or the defendants as he was in so much difficulty. He was bound to say that the plaintiff had not satisfied him that he did not get the Orchids that he bought That being so, the plaintiff had failed in his action As the plaintiff might be able to satisfy another judge in another court, he would imple nonsuit the plaintiff so that another action might be brought else where. He allowed the defendants their costs

NEW CHRYSANTHEMUMS.

 $+4\,\gamma\sigma\rho^{\mu\nu}$ and 3 , Mr (* E Pennson, Chilwell, on the 10th instance)

Taking the meaned ection first, not because they now occupy that position, but from old habit, and the fact that, being few, they are soon disposed of I should like to remark that I think our judges are getting a little Ly in their requirements esto form, perhaps because nowlities in this class are scarce, and therefore they do not wish to reject anything which has any pretensions to call itself on incurved. But the fact remains that several which have been admitted lately have a coord deal of Japanese blood in them, and require not a little in anipulation to fit them for the bourds.

Of the new incurved, Charles H. Curtis has undoubtedly taken the first place, being a grand flower in form, size, and colour, also an easy variety to grow, as may be gathered from the speed with which it has taken its place as a standard variety all over the country. I should give the next place to Mrs. R. C. Kingston, sent out the same year

(1845), a pule rosy-pink of first size and perfect form. It also is a good doer, coming in at the right time without stopping or other aid. Another very good pink of the same season is Mrs. Junes Murray (Joorn, of Hort., p. 420), not quite so large, but worth adding to a select collection. George Haigh, a dull bronzy flower, sent out this year, is a sport from R. Petfield, and is worth having, but, like the parent, needs special culture. It should be either stopped in May or else rooted late and grown on quickly. Two other new bronzes are Bonnie Dundee (1896), and D. D. Crane (1895); the latter is a neat pretty flower, but only large enough for the frent row; the former I had great hopes of, but it is coming cross-eyed with me; however, the queer season we have had may have induced this. I hope that it may come all right another year, as it is a true incurved and pretty colour; it should be stopped in March to get it in time for the exhibition season. L'Améthyste, one of Calvat's 1895 set, was shown a 'incurved hast year, and will be valuable from its purple, joiour, but it is too late with me to say anything of it yet, and I suppose this is the case with others, as I have not seen it shown this year. I should a lyise stopping it in April next year, and taking the first bud ter.

I am sorry not to be able to say a good word for the red or crimson novelties of the past two years, as we want the colour sadly. Owen's Crimson has not given me a flower fit to exhibit. Jno. Fulford is better, but shows a large eye, which must be taken out early to get a full flower. Of whites we have not had much since J. Agate in 1891, the only one I have noted being Mrs. F. Hepper, sent out this spring: a well-full flower, of medium size, but rough. Before leaving the incurved section 1 may mention Major Bonnaffon (sent out in 1894) in order to give a cultural hint, is it comes a pure Jupunese if taken in early bud. It should be stopped March 1, and not given too large a par

Coming now to the Japanese, and again taking the yellowsfirst, I think this has been a red letter year for the colour. I am of the opinion that we have in Modestum and Australian told, two of the grandestnovelties seen for the last ten years, and being so opposite in shade, there will not be any rivalry between them. Modestum is the richest colour ever seen, and simply extinguishes any other yellow placed by it for comparison. The two are faultless as to size and form, and are also fortunately good doers: those who saw the fine flowers of Australian Gold shown recently at the Royal Herticultural Society on small lite-struck plants in 48%, will concur as regards that kind, and I believe Modestum will prove equally free.

of the other new yellows, Oceana, a grand incurved flower, is worth making a note of; while Pallanzu is now so well known as to so reely need mentioning. I am rather doubtful, now that we have tried it a second season, whether it will oust Sunflower from the show board, but it is a lovely bloom for all other purposes. Idith Tabor and Phodons are both splendid flowers, with long stilling florets, and not difficult to manage, requiring no stopping or special treatment. The former is a little too till for decorative purposes, but this does not count for much with exhibiting enthusiasts. Though yellows are so many, John Seward must not be left out, as it is a grand flower, and of different form to most of those already mentioned, the florets being long and strapeshaped. It is a pure clear yellow except on late buds, when it assumes a bronzy tint. Buds should be taken fairly early, as it takes a long time to open. Still amother grand yellow is Simstone, deep orange at the centre, shading to primitose at the outside. This was sent out in the spring, but is very little known, however, and will undoubtedly be heard of next season. Two promising yellows, sent out in the spring of 1896, have disappointed most buyers—viz, W. Slogrove and Lago Maggiore. Of the first I have not seen a good flower, and the second is too small for anything except decoration.

Coming to whites, the swarm is almost as great as the yellows. One of the best is Lady Byron, a charming flower of most graceful form though large. Grown naturally it is a little too early, and requires stopping in March, taking first but after. It is rather tender rooted, and should not have too large a pot. Mrs. Richard Jones is another lovely white, with long drooping florets enring upwords at the tip It is an easy one to grow, requiring no stopping or special treatment. Mrs. Chas. Blick is an ther good white, doing best I find on late-rooted plants; and there are in a blitton three fine whites in Calvat's set for this year, all worth having—vir., Baronne Ad. de Rothschild, Mrs. J. Lewis, and Madame Gustave Henry. I had almost overboked two, which should however be mentioned vir., Emily Silsbury, for early work the best October variety to date, and Elsie Teichmann, a pretty flower on very dwarf sturdy plant, bur not, I think, quite full enough for the board.

of tinted whites, Mrs. II. Weeks takes the pdm, being, in fact, worthy to rank with Modestum as the two finest novelties of the season. The reason it was not staged so freely as was expected on Tuesday, November 10, is that it requires special treatment, which, of course, the growers were not aware of the first season, and most of them will only get it ally general when the shows are over. It is naturally very late, and should be rooted as early as possible, pinching the point out at the end of January. N.B.—This is the raiser's advice; but my grower says he would prefer March 1, and take the first bud after. This ought to be widely known, as it is such a splendid flower as to be worthy any pains to get it. Pride of Exmonth (Joecand of Hoetenthere, p. 469) is a white with pink markings, very distinct and good; as is also William Fyfe, a variety approaching the old Belle Paule, in colouring. Of the real pinks, the finest as an exhibition flower is Australic, one of the first fruits (with Oceana fron

The Antipodes, where the Mum craze has taken largely; it is a purple-pink, with silvery reverse, immense in size, but not so coarse as some of the same race, e.g., Mrs. Harman Payne.

There are two or three of the striped yellow and bronze Japanese worth mentioning, the best perhaps being Mrs. Jno. Shrimpton, an immense deep yellow bloom with reddish stripings, should be stoppe I in the middle of May. Arona is also a fine flower, much in the colour and build of Colonel Smith, but having more substance, and consequently a much better laster, the Colonel being notoriously deficient in this respect. Mons, Chenon do Leché, a curious mixture of salmon, bronze, and yellow, is n win its second scason and thoroughly established. There is no difficulty in timing it, as it makes buds so freely that if one be removed another may be confidently expected within ten days. Olive Oclee, a bronzy incurving flower which was expected to be very fine this year, is a failure with me, and I have not seen it good elsewhere. I had forgotten Mrs. Herman Kloss, a grand flower and distinct colour, orange overlaid with chestmut-red; it is one of the best of this year's novelties. I will conclude my list of Japanese with one which stands quite by itself in colour—viz. Mrs. Briscoe Ironside, a lovely flesh-pink, the best, I consider, of Mr. Ironside's introductions. It is a good doer, an I requires no stopping. I have some charming flowers on plants the cuttings of which were not in-erted until March 20.

The singles are most charming subjects for table decoration, and there are several very pretty novelties this season, among them notably Annie Tweed, a deep narrow crimson, Ewan Carverun and Mrs. Stubbs, white (one Japanese and the other a round regular flower): in addition to which Mr. Divis has a fine crimson single, with exceptionally large flowers, which will probably come out next year. The list of fine things 1 have given is a triumph to the raisers who are at work on the autumn queen, and I do not think we have reached the limit of improvement, or indeed approached it. Already several grand seedlings have been shown, which will be heard of later, but as less than half the season has clapsed it would be premature to say anything of future prospects.

SOCIETIES.

ROYAL HORTICULTURAL.

November 24.—The meeting held at the Drill Hall, James Street, Westminster, on the above date, was, considering the lateness of the date, an unusually bright one, numerous orchids, including many crosses and hybrids of a remarkable character; tables filled with Chrysanthemum blossoms, chiefly of Japanese and single-flowered varieties. Gloxinias, Coleus of varied colouring, a fine group of Dracema, and some small collections of fruit, including some very well-grown Pine upples from Frogmore being exhibited.

Floral Committee.

Present: W. Marshall, Esq., in the Chair; and Messrs. J. Fraser, H. Herhst, R. Dean, J. H. Fitt, R. Owen, G. Stevens, J. Hudson, J. F. McLeed, C. J. Salter, W. Bain, T. Peed, G. Nicholson, J. D. Pawle, C. E. Shea, C. N. Pearson, C. Jeffries, J. T. Bennett-Poë, G. Gordon, H. Turner, E. Mawley, and J. Laing.

A fine South Sea Island Draecua, discovered by Mr. J. Broomfield (fig. 115), was shown by Messrs, Sander & Co., St. Albans, deservedly securing a First-class Certificate. The leaves are 15 inches long and 2 inches wide where widest, are margined heavily and striped lightly with white. The plant is short jointed as regards the stem, and compact in habit, indicating, we should say, slowness of growth, and the leaves on the plant shown are well retained, also evidence of this. They also showed Cephadotus follicularis, well furnished with its richly-coloured pitchers of green and velvety-brown. One one plant of the species was placed under a bell-glass, and to this specimen a Cultural Commendation was given.

E. Hyde, Esq. Castle Bur, Ealing (gr., Mr. Holloway), showed the original Chinese Prinnose, P. sinensis, in three well-flowered examples, the colour a rosy earnine, petals redeved, the segments, five in number, leaves amrow and deeply serrated. He also showed a cross obtained between this species and P. obconica, in which the corymb of blossoms somewhat partakes of the character of the latter species in regard to its form, height of stalk, as also the form of the leaf. The flower-segments do not reflex as in P. sinensis, but are slightly cusped, and in colour intermediate between the parents. A cross between P. sinensis and other species of Primula has for long been a desideratum with gardeners, and now that one has been obtained, we may look for great improvement along certain lines.

Messrs, Huen Low & Co., Clapton and Bush Hill, Enfield, showed a number of diverse winter flowering Carnations viz., Tidal Wave, a flower of a deep-cerise colour; W. Scott, rose-pink; Daybreak, Helen Keller, Mrs. Nicholson, and others. Some well-grown and bloomed Cyclamen persicum grandfilorum were amongst their exhibits. A Flora Medal was awarded.

Mr. R. Gulzow, Melbourne Nurseries, Beyley Heath, Kent, showed a group of finely-coloured Dracamas, among which we noticel good examples of Duchesse d'Grleans, with the foliage of the lower half of the plant of a bronzy colour, and that of the upper half a very brilliant crimson; the leaves are of great width in comparison with their length, which is about 8 inches; also Sanderiona, Barreni, Lindeni, Lord Wolseley, Renardi, Manenk Bey, A. Schütt, Doucetti, &c. Δ Floral Medal was awarded to Mr. Gulzow.

Mr. F. W. Moore, Botanic Gardens, Glasnevin, showed flowering shoots of Buddleia ma dagascarensis, with racemes of small orange-coloured flowers, which are said to grow of far greater length in the South of France. It is probably too tender for out-of-doors culture anywhere in these islands.

Mr. H. Becker, Jersey, showed a ragged-looking singleflowered Chrysanthemum. Daisy Belle, white, with a yellow

Messrs. J. Veitch & Son, Royal Exotic Nursery, Chelsea, showed Begonia Myra, derived from a tuberous variety, and B. Socotrana; the flowers are single, of a rich rosy-crimson colour. The male blossoms fortunately are somewhat freely produced; the foliage is almost orbicular in shape, of a deep green colour. Another Begonia shown was of similar but not identical parentage. It possesses peculiar double flowers, or more truly, the commencement of doubling, which are of almost the same shade of colour as Myra, and the habit of the plant is more compact than that variety. It is named Ensign, and received an Award of Merit. This irm also showed a collection of warm-house Rhod-dendron hybrids of the Javanico-jusminiforum type, all of them of beautifully distinct yet soft colours, the trusses large, with many blooms on each. An Award of Merit was made to R. Cloth of Gold, a product of a cross between R. Lord Wolseley × R. Teysmanni. The truss in the case of this

coloured incurved variety, with drooping florets; and Madam A. Chatin (Silver Banksian Medal).

From Messrs. Henry Cannell & Sons, Swanley, came a choice collection of new varieties, which comprised Pride of Swanley, a reflexed white Japanese; Mrs. E. Cannell, rosypurple, with silvery reverse, rough as shown; Charles Wilkins, delicate blush; the yellow sport from Elsie (an Award of Merit, Mrs. E. Staines, white; and Madoc, bronzyorange—both single; and C. F. Payne, a broad-petalled soft yellow Japanese.

Mr William Wells, Earlswood Nurseries, Redhill, also had a select collection, including Miss Louise D. Black, a deep golden incurved, fine in colour—a large, full flower, but bordering closely upon the Japanese character (Award of Merit); Gem of Earlswood, an Anemone Pompon, with delicate pink ray-florets, and a bright golden centre—a charming combination, and of the best form (Award of Merit); James Lynch, an orange-chestnut reflexed Japanese; bunches of bloom of Calvat's Australian Gold, cut from plants in 48-sized pots; some attractive single varieties; G. J. Warren, the pale yellow sport from Madame Carnot, which the committee wished to see again in better condition; and Lady Hanham, a delicate silvery buff-pink sport from Viviand Morel, likely to make a useful decentive variety (Bronze Eanksian Medal).

Mr. T. S. Wabe, Hale Farm Nurseries, Tottenham, also staged a collection of cut blooms, consisting of Golden Gate, Mrs. Smith Ryland, a large golden incurved Japanese; Robert Owen, Mr. Cleveland, a sulphur-white incurved; Mrs. Langtry, blush; and Miss Lister Martin, pink, both single

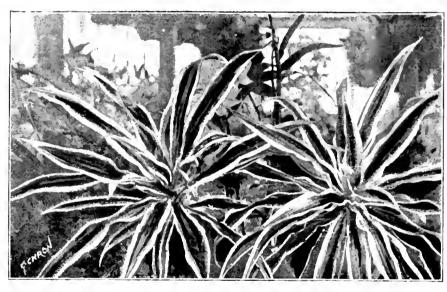

FIG. 115. - DRACENA BROOMFIELD.
(See Report of Royal Horticultural Society on p. 656.)

variety is large, as are the individual blooms, and the colour a soft shade of yellow.

Messrs, Fisher, Son, & Sirray, Royal Nurseries, Handsworth, Shetfield, showed a yelfow-coloured variety of warmhouse Rhododendrons, named Countess of Derby, in which there is a tendency towards doubling. The truss was of middle-size and the colour printings of product.

there is a tendency towards doubling. The truss was of middle-size, and the colour primrose-yellow.

Sir Trevora Lawrence, Bart., Burford Lodge, showed Sonerila Leopold II., a well-bloomed example, with bronzy leaves, furnished with lines of silvery detail colour of the flowers rosy-lilac; the height of the plant was an unusual one, being 15 inches (Award of Merit)

W. Bryant, Esq. Stoke Park, Slough, exhibited Primula sinensis fimbriata in two varieties—the so-called blue, and a white one. The flowers were in each case large, as also the trusses, but the foliage was sparse (Silver Banksian Medal)—Mesers, Youse & Hounson, Holmesdale Nurseries, Steven-

Mesers, You's & Domissos, Holmesdale Nurseries, Stevenage, showed numbers of shouts of varieties of Coleus, and blooms of Gloxinias. Many of the Gloxinias were of good size and substance, with distinct colour, very pleasing in some instances. The Coleus were chiefly of the tender indoors varieties.

W. F. Darnell, Esq., Devenshire House, Stamford Hill (gr., Mr. Davies), showed a group consisting of small Crotons in pots and cut blooms of Chrysanthemums, chiefly those of Japanese varieties. A few Pandams Veitchi, small specimens of Cooos, Ferns, &c., were used in the group (Silver Banksian Medal).

The Chrysanthemum did much towards furnishing the

The Chrysanthemum did much towards furnishing the Drill Hall on this occasion, and in company with many good varieties now in cultivation, there was a good sprinkling of novelties, though the committee exercised a wise discretion in making awards to novelties.

From Mr. Charles E. Shea, The Elms, Foot's Cray, Kent,

From Mr. Charles E. Shea, The Elms, Foot's Cray, Kent, came a selection of some of the leading Japanese varieties, such as Golden Gate, Thos. Wilkins, M. Chenon de Leché, Maggie Blenkiron, an incurved flower in the way of Lord Brooke; Mdlle. Thérèse Rey, Abbe Mendalhall, a sulphur-

varieties. Mr. B. Ladhavis, [Shirley, Southampton, sent fine bunches of Golden Elsie, a valuable sport that will make an excellent market and decorative variety (Award of Merir)

an excellent market and decorative variety (Award of Merit)
Mr. W. Jinks, gr. to E. Beuer, Esq., Walton, had some fine
blooms of Japanese. Mrs. Maling. Grant, a very promising
variety recently Certificated by the National Chrysanthemum.
Society, but which on this occasion arrived too late to come
before the Committee.

Mr. R. Owen, nurseryman, Maidenhead, had Japanese C. A. Owen, a fine broad-petalled incurving Japanese, bright gold in colour, and very fine (Awar lef Merit); John Ma fee, pale yellow, deeper in the centre, (Lapanese of a decidedly promosing character; Mrs. Hugh Fenwick, a large white reflexed Japanese, with pale pinkish like basal florets; Mrs. J. Reggs, a delicate pink, large broad petalled Japanese; T. Lockie (incurred), soft like, with blush and sulphur centre, a heat flower of a promising character; Mrs. T. D. Hatfield, a small yellow incurred; Marcia Jones, a white Japanese Anemone; W. Slogrove, &c. (Silver, Banksian Medal).

Messrs Young & Doatnson, Stevenage, had a mixture of varieties—Japanese. Incurved, Pempon, and single—of somewhat your quality, but said to be from plants grown only for cuttings (Bronce Banksian Medal).

only for cuttings (Bronze Bankson Medal).

Mr. W. Batchelor, gr. to Lieut Cclonel Verney, Unbridge, had about three dozen blooms of fine Japanese, including such leading varieties as Golden Wedding, Hairy Wonder, Ruth Wynne, Ethel Addison, Robert Owen, Louis Boehmer, &c. From Mr. Rickwood, gr. to the Dowager Lady Freake, Fulwell, came some effective bunches, set up in a tasteful manner, the leading varieties, Viviand Morel, Gloire du Rocher, Louis Boehmer, J. Shrimpton, Sunflower, G. C. Schwabe, Challenger, Stanstead White, &c. (Silver Banksian Medal).

Medan, Mr. W. Bain, gr. to Sir Trevor Lawrence, Bt., Burford Lodge, Dorking, staged a plant of Japanese Mrs. Joseph Thompson, a large and full ivory-white incurved Japanese of great promise (Award of Merit).

Orchid Committee.

Procest: Harry J. Veitch, Esq. (in the chair); Sir Trever Lawrence, Bart., President of the Reyal Horticultura Society; and Messrs. O'Brien (Hon. Sec.), J. Gurney Fowler, E. Ashworth, De B. Crawshay, H. M. Pollett, H. B. dlantine, F. Sander, W. H. White, E. Hill, J. Jaqués, H. J. Chapman, W. Thompson, C. Winn, C. Pilcher, W. Cobb, J. Douglas, S. Comtauld, W. H. Protheroe, T. B. Haywood, Dr. Masters, and C. Moore of Sidney, N.S.W.

Baron Sir H. Schroner, The Dell, Egham (gr., Mr. H. Ballantine), exhibited a group of grand cut examples of rare Orchids, among which were the remarkable Veitchian hybrid Sophro-Cattleya & Adypso Sophronites grandifora §. Cattleya Loddigesii - Harrisoni 5), with remarkable flowers over 4 inches across, and the general form and thick texture of C. Harrisonia, but much more openly displayed, especially the handsome labellum. The flower was of an uniform rose-purple, the centre of the Lobellum rose orange. In the group also were line spikes of the purple-spotted Odontoglossum Pescatorci Schroderianum; the unique and finely-coloured O. Wilckeanum Godefroya. O. Chestertoni; Cypripedium insigne Sandere, C. > Niobe, Dendrobiums Phalenopis Schroderianum, Ledio-Cattleya > exeni nsis, and the beautiful and delicately-tinted L.-C. > Baroness Schroder. The group was awarded a silver Banksian Medal. Sir Traevor Lawrence, Bart., Burford, borking (gr., Mr. W. H. White), showed Ladia × Juvenilis (Perrini §, pumila §), a very handsome hybrid, with light rose-purple flowers, possessing a purple-coloured lip (Award of Merit); and Sobridia Lindeni, a white flower, with purple veining on the lip Mesers, Jas. Veire it & Sos, Royal Evotic Nursery, King's Bond, Chelsea, staged a remark bile group, consisting chiefly

Messis, Jas. Vetten & Son, Royal Evotic Nursery, Kinz's Road, Chebsea, staged a remark idle group, consisting chiefly of crosses raised by them, and which were no fewer than six distinct Cypripediums, which in some instances were derived from the rare C. Fairicanum on one side. The most beautiful of these was C. x. Baron Schröder (conanthum superbum?, Fairicanum?), which was awarded a First class-certificate. It is the most perfect in form of the set; the apper sepal white, with about fifteen heavily-dotted and for thered lines of purple; the broad petals a pale pellow, but furnished with purple-brown lines, and some sporting on the lower halves, the shining lip has also some yellow veins, and it is tinged with purple-brown and which also secured a First-class Certificate, was Ledio-Cattleya. Decia alba (L. Perrini?, C. anca 3), in which the sepals and petals are pure white, and the hip a delicate rose pink, with that indescribable close tracery of silvery-white which is generally to be remarked in this fine hybrid. Two other novelties were Ledio-Cattleya. Triesis (C. Bowringiana 1, L. C. elegains Turneri 3) very bright if wers, purple-rose tinted (Award of Merit), and Ledia. Omen (purpurata 2 autumnalle), a very singular leading diverse of a light research are Latine to the second and late the remarked and perfect of the property of which the sepals and petals are pure white, and the hip a delicate rose pink, with that indescribable close tracery of silvery-white which is generally to be remarked in this fine hybrid. Two other novelties were Ledio-Cattleya.

Tiresis (C. Bowringiana a., L. C. elegans Turneri 5) very bright il wers, purple-rose tintel (Award of Merit), and Lelia a Omen (purpurata a autumnalis) a very singular booking flower of a light rose colour. In the body of the group were noted examples of Lelia-Cattleya a Decia, L. et al. Lady Rothschild, and L. et a Statteriana, all of them handsome hybrids of L. Perrini, and noted in the report of the last meeting; L.-C. a Pallas, Cattleya & Fabiola, Phalamopsis a Brymeriana, home-raised; Cattleya & Chloris, Dendrobium glomeratum, D. subchausum, D. Cassiope, D. eucomum lemopterum, Amguloa unillora Turneri, &

enosmum leucopterum, Anguloa uniilora Turneri, & Nodaan C. Cookson, Esq., Oakwood, Wykameon-Tyne (gr., Mr. Wm. Murray), sent a remarkable home-raised Odontos glossum between O. Hulli-leucoglossum and O. crispum Cooksoni, and named O. Halli-crispum. Its flowers were of good size, and in the form of the lip and crest they disclosed much of O. Halli. The sepals were creamy-white upon which are some large red-brown blotches; the petals are of creamy-white, with one large and several sin d blotches, and the white lip had a yellow crest, and one large blotch in the centre (First-class Certificate); doc Cypripedium > Chapmanii (Curtisii - bell-dulum - The upper sepal was white, with jumple dotted lines, the broad petals also white, with innumer die block is dots over the surface, and the lip faced with rose

E. Ashworth, Esq., Horefood Hall, Wilm-low, Cheshire

E Ashworth, Esq., Hurefield Hall, Wilhalow, Cheshire (gr., Mr. Holbrook, showed Leib-Cattleva - Sphilleriana, Ashworth's variety, a very fine form with flowers as showy as those of Ledia purpurata, and with blush-white sepals and petals, and rich purple labellum (Award of Ment), Ledia autumnalis alba, Lucy Bodd, the best white form of the species; and the singular little Epidendrum (Nanodes) Matthewsii.

R. I. Meastles, Eq., Cambridge Lodge, Camberwell, gr., Mr. H. J. Chapman, sent the new Cypripedium. Regina (Leeanum. Faineanum). Cabarraing hybrid with the general aspect of C. Arthurianum, but with nne white dorsal sepal with purple dotted lines; C. Edwardii superbum, a very pretty variety; C. Olemus (bellatulum. ciliolare), and Ledio-Cattleya. Sallierii, with pale cose flowers having a dark rose-coloured marking on the lip.
Mr. Jas. Dorollas, Great Bookham, surrey, showed Ledio-Cattleya. Apollonia (L. purpurata. C. Dowiana, a showy hybrid, with flowers somewhat resembling those of L. C. x.

Mr. Jas. Doreitas, Great Bookhain, Surrey, showed Ladio-Cattleya - Apollonia (L. purpurata - C. Dowian e, a showy hybrid, with flowers somewhat resembling those of L. C. & Pallas; sepals and petals of a light rose colour; hip of dark crimson-purple, crumpled at the edge, and margined with like (Award of Merit).

Sir Ww. Marriott, the Down House, Blandford, showed

Sir Ww. Marriotti (Sophronitisgrandiflora), showed Sophro-Ladia - Marriotti (Sophronitisgrandiflora) - L. flava), a hybrid of singular aspect, having the growth of S. grandiflora, but stouter, and bearing a three-flowered inflorescence of orange-coloured flowers, which resemble those of S. grandiflora, but with the peculiar elongation of the lip, as in Ledia flora.

G. SHIRLAND BALL, Esq., Ashford, Wilmslow, Cheshire (gr., Mr. A. Hay), received an Award of Merit for Cattleya labiata, Ashford variety, perhaps the richest and brightest in colour of any shown this season. Mr. Ball also showed the fine white C. labiata alba.

E. H. Woodall, Esq., St. Nicholas House, Scarborough (gr, Mr. W. Hughes, sent a model plant of Vanda corulea, with seven growths and five magnificent spikes, for which a

Cultural Commendation was given.

Messrs. F. Sander & Co., St. Albans, hada pleasing group, Messis. r. Sander & Co., N. Aloans, nata pleasing group, in which were the fine Cypripedium Leeanum giganteum, C. X.L. reticulatum, C. X.L. superbum, and C. X.L. virginale, the last-named a very fine bold flower. Also Ladio-Cattleya alb mense var. Lady Brougham, a great improvement on the albindisever, Lady brogadan, a great improvement on the older form: some good Dendrobium Johnsonice, Cattleya labiata, Cymbidium × Winnianum, a curiously - margined aniata, Cymordum & winnianum, a curiously - margined variety of C. giganteum, Dendrobium Fairfaxii, Cypripedium × Mrs. C. Maynard (nitens magnificum × Boxalli), Odontoglossum Krameri and O. K. album; Sophronitis grandifiora, Angreeum polystachys, Spiranthes Forgetianum, &c. (Silver Europein Med.). Banksian Medal).

W. BRYANT, Esq., Stoke Park, Slough (gr., Mr. D. Kemp), showed Cattleya labiata, Stoke Park variety, a noble plant, with a four-flowered inflorescence of very large light-coloured with a four-flowered inflorescence of very large light-coloured flowers. W. Thompson, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens), showed the rare Odontoglossum × elegantius; also a dozen fine drawings of rare Orchids in his collection. Walter Cobe, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howes), showed the clear yellow Cypripedium insigne Sanderianum, and the elegant little Liparis longipes. Admiral Cator, Hazelwood, King's Liparis longipes. Langley (gr., Mr. G. E. Day), sent Cymbidism cyperifoliun, with elegant narrow leaves, and an inflorescence resembling Spots. H. Worthisoto, Fag., Abbey Liwn, Whalley Range, Manchester, sent Catasetum × splendens Worthingtonianum, a large white flower, with purple tinge on the lip and petals.

Frau Ida Brandt, Riesbach, Zurich (gr., Mr. J. Schlecht), sent fine Oncidium Forbesii, Odontoglossum Insleayi splendens, O. Harryanum, Vanda cerulea, Brassavola cuspidata, REGINALD YOUNG, Esq., Sefton Park, Liverpool (gr., Mr. Poyntz), sent Cypripedium × Pitcherianum magnificum, a fine form of C. × Niobe, and several very distinct varieties of C. insigne. Walter C. Clarke, Esq., Liverpool, sent Cypripedium × polychromum (× politum × superbiens).

F. W. Moore, Esq., Royal Botanic Gardens, Glasnevin,

F. W. Moore, Esq., Royal Botaine Gardens, Geisnevin, Dublin, exhibited Acanthophippium javanicum (Botanical Certificate). Miss N. Roberts, 72, Loughborough Road, Brixton, S.W., showed a collection of very clever coloured drawings of Orchids, G. O. Sloper, Esq., Westrop House, Highworth, showed a good Cypripedium × Lecanum.

Fruit Committee.

Present: P. Crowley, Esq., chairman; the Rev. W. Wilks, secretary; and Messrs. T. F. Rivers, W. Fyfe, J. Smith, G. Wythes, W. Farr, C. Herrin, W. Bates, J. A. Laing, A. Dean, J. Wright, A. F. Barron, J. Veitch, G. Miles, J. Cheal, F. Q. Lane, J. Willard, and G. Woodward.

An Award of Merit was given to Apple Clapham Beauty, a an Award of Merit was given to Apple Clapham Beauty, a pretty round flattish variety of medium dessert size, skin green, shaded with red, flesh soft, good flavoured, and juncy. This came from Mr. H. J. Sheltard, Bedford. A similar award was made to Apple St. Martin, useful dessert-size, fruits conical, striped red, and pretty. Flesh pleasant, and great flavour. Flesh Magazin Land. good flavour. From Messrs, RIVERS & Son, Sawbridgeworth, good havon. From Messis, Kivers & 508, Saworiageworth, who also had Broken Hill Pippin, not unlike Adams Pearmain in size and form, but paler in colour. Mr. J. C. Tal. Lach, of Livermore Park, Bury St. Edmund's, secured an Award of Merit for Apple Livermore Favourite. fruits were of fair size, conical, intensely coloured, and hand-some, and soft pleasant flesh, without special flavour, that was quite white. It should make a capital market variety.

Mr. Owen Thomas, Her Majesty's gr. at Frogmore, was awarded a Silver-gilt Knightian Medal for an exhibit of twelve splendid Queen Fines, that were in size and fruit, perfection. Mr. Thomas also showed a dish of yellow Tomato Royal Windsor. This, it was desired, should be tried at Chiswick next year with some other of the large yellows. Also he had twelve very beautiful fruit, 14 inches in length, of smooth green and handsome Cucumber Frog-Prolific, to which a Cultural Commendation was awarded.

Mr. C. E. Suea, Foot's Cray, Kent, staged a nice, though small, collection of twelve dishes of Apples and Pears. The varieties included of the former Gascoigne's Scarlet, in wonderful colour; Beauty of Kent, Lane's Prince Albert, Baumann's Red Reinette, Reinette du Canada, &c.; and of Pears Leon le Clerc de Leval, Catillac, very fine; Olivier de Serres, &c. A Silver Banksian Medal was awarded.

A similar award was made to a large collection of forty-six A similar award was made to a large collection of forty-six Apples and eighteen of Pears, from Messrs, J. Pearb & Sons, Norwood. They had of Apples, very good for the season, Lord Derby, Bismarck, Red Bietigheimer, Hormead's Pearmain, Lane's Prince Albert, Cox's Orange Pippin, King of the Pippins, Wadhurst Pippin, Hoary Morning, Fearn's Pippin, Betty Geeson, &c.; and of Pears, very fine Uvedale's St. Germain, Catillac, Bezi Mai, Duchess Tardine, Josephine de Malines, Chaumontel, &c.
Mr. Batchelor, gr. to Lieut.-Col. Vennon, Harcfield, Uxbridge, staged a dozen small heaps of fruit very prettily on diverse coloured woodwork, arranged in squares. The method, however, was not so good as showling in plates.

method, however, was not so good as showing in plates. The fruits, chiefly Apples, were generally small, the best being Blenheim Pippin, Wellington, Ribston Pippin, King of the Pippins, &c. A Bronze Banksian Medal was awarded.

A single specimen of Bismarck Apple, sent by Messrs. Hersr & Soss, Burbage Nursery, Hinckley, merited notice, as being the largest of the variety yet seen. It weighed 18 oz., and had a circumference of 15 inches, and was hand-

some and well coloured.

Mr. G. Wythes, Syon House Gardens, had a dish of Vilmorin's white tuberous Artichoke, the tuber being 6 inches long. It was thought that this unusual elongation was a product of the season, having grown out, as Kidney Potitos will.

For Messrs, Veitch & Son's prizes, there were twelve dishes of Apples staged, and Mr. C. Herrix, Dropmore, came 1st, of Apples staged, and Mr. C. Herrin, Drophiore, came 188, with nice, clean, but not highly coloured Cox's Orange Pippin; and Mr. W. H. Divers, of The Gardens, Belvoir Castle, was 2nd, with a very high-coloured, conical Apple, very handsome, and having white flesh, named La Neige. The flesh was soft, but not materially high-flavoured. The Ribston Pippin, Melon-Apple, and Blenheim Pippin were also shown. Both the prize Apples were from orchard standards, the former on gravel, and the latter on clay.

There were eight dishes of Pears shown, the 1st prize being given to Beurre du Buisson, a medium-sized nuggetty being given to Benrre du Bunsson, a medium-stated maggetty obovate variety, having nice juicy soft flesh that was very well flavoured. This came also from Mr. Invers, the tree from which the fruits were gathered being worked on the Pear stock, and grown on an east wall. The second best Pear stock, and grown on an east wall. The second best variety. Knight's Monarch, a medium-sized sample, came from Mr. O. Thomas, but no particulars were furnished. Winter Nelis, Beurré D'Antonne, and Glout Morceau, were also shown but all backed days for the property of the particular of of the pa also shown, but all lacked flavour.

BRIXTON, STREATHAM, AND CLAPHAM HORTICULTURAL.

November 11, 12.-The 37th Annual Exhibition of this Society was held at the Town Hall, Streatham, on the above The groups of Chrysanthemums were of great heauty and excellence, and were, in the opinion of the judges, all worthy of a let prize. The cut blooms of Japanese Chrysanthemums were exceptionally fine, and the competition amongst the exhibitors was exceedingly keen. Some remarkably fine foliage plants and Ferns were staged, and it was a matter for regret that the state of the funds did not permit of extra prizes being given. A grand display of Orchids was made. The ladies' baskets of Chrysanthemums, Ferns, foliage about 6 freezes for the ladies' baskets of Chrysanthemums. foliage plants, Grasses, &c., were more numerous and tasteful than upon any former occasion, and the growing interest in these exhibits is encouraging to the kind donor of the special prizes offered for this class,

The National Chrysanthemum Society's Jubilee Medal was awarded to Mr. Howe for Group of Chrysanthennuns; and the Certificates, one to Mr. Weston for six trained Japanese Chrysanthemums, and the other to Mr. MURSELL for twentyfour cut blooms Japanese Chrysanthemums.

LICHFIELD CHRYSANTHEMUM.

November 18 .- A Chrysanthemum show was held in St. James' Hall on the above date under the auspices of the old Lichfield Horticultural Society, which boasts an existence of over eighty years. The show throughout was an excellent one in every section. The table accorations, bouquets, fruit, and vegetables well maintained the reputation of the gardeners of the district.

Among attractive exhibits of the non-competitive section Among attractive exhibits of the non-competitive section were the fine baskets of cut flowers, bonquets, and other floral arrangements sent by Messrs. Perkins & Sons, Coventry; the fine bunches of Gros Colman Grapes, Queen Pines, collections of vegetables, twelve dishes of very fine Apples, and a number of Pears, shown by Mr. T. Walmsley of the City Seed Stores, Lichfield; the fine groups of Lily of the Value and other whore shown by Mersey Marrangement. of the City Seed Stores, Lienneid; the nie groups of Lily of the Valley, and other plants, shown by Messrs. Matthews & Brooks, nurserymen, Liehfield; the collection of decorative plants, including the winter-flowering Pelargonium Madamo Jules Chrétien, shown by Mr. Barran. Groups of Chrysanthemums were shown by General

Groups of Chrysanthemums were shown by General Dvoit, Freeford Hall, Lichfield (gr., Mr. Dia), who was 1st. The best three plants of Chrysanthemums were shown by General Dyott and Sir C. Forster; and the best three incurved varieties were those of General Dyott and Mrs. HINCKLEY.

A group of incurved plants was shown by Mrs. HINCKLEY, including Orchids, Caladium argyrites, Eulalia japonica, Dra-

coems, Ferns, Richardias, &c.
Mrs. Chabwick had the best twelve blooms of Japanese varieties, and General Dyour the 2nd best.

Captain West, Elford, was 1st for six Japanese; and Mrs. Chapwick had the boost twelve and six incurved.

TWICKENHAM HORTICULTURAL

November 17, 18.-The twenty-eighth annual autumn exhibition took place in the Town Hall on the above dates, and was universally admitted to be the best show held for

Mr. A. II. Rickwood, gr. to Ludy Freake, had the best group of Chrysanthemums, quality and effect being the leading features; Mr. G. H. Sage, gr. to the Earl of Dysart, Ham House, being a creditable 2nd.

A very pretty and effective feature was made in the class for a group of miscellaneous flowering and foliage-plants, 1st, Mr. H. E. FORDMAM, The Nurseries, Twickenham.

A group of Orchids in flower, tastefully interspersed with Ferns and other foliage plants, gained 1st honours for Mr. W. H. ODLUM,

The principal cut bloom class, in which five competitors appeared, was that for twelve Japanese and twelve incurved, distinct. Here Mr. C. J. Waite, gr. to the Hon. W. P. TALBOT, Esher, gained the leading award with very fine blooms in each section. Mr. T. Osman was 1st for eighteen incurved varieties.

A noble lot of flowers was contributed in the class for

eighteen distinct varieties of Japanese, which came from Mr.

E. Coombs, gr. to W. Furze, Esq.

The best incurved bloom was a fine C. H. Curtis, were from Mr. C. J. Waite; and the best Japanese, a highly coloured Charles Davis, from Mr. E. Coombs.

The leading prize for twelve Anemones was taken by Mr. J. Wright, gr. to H. A. TUFNELL, Esq. Table decorations, of which the Chrysanthemum formed

the chief feature, were well shown by Mr. Waite, the Misses Cole, the Misses Freshwater, Mr. A. Pentney, and others. Other table decorations were well shown by Messrs, T. G. MacGREGOR and A. H. RICKWOOD,

As usual, wonderfuul examples of Grapes, Apples and Pears, for competition, were very successfully shown by Messrs. Sage, Bentley, Rickwood, Osman, Burton, and

Vegetables and fruit in competition, and as honorary exhibits formed, as usual, an interesting part of the show; and we may give the names of the following exhibitors, Messrs. C. J. Waite, Poulart, and J. Peed & Sons.

BRISTOL CHRYSANTHEMUM.

NOVEMBER 18, 19.—The thirty-third annual shew of this Society was held on the above dates in Colston Hall, and proved to be the best that the Society has as yet held, Entries were unusually numerous, and the competition close, particularly in the classes for cut blossems of Chrysanthemums, which were of great excellence. The groups were also of considerable merit, as were likewise fruit and vegetables.

Cut Floreurs. — Thirty-six blooms, Japanese, Ist, Mr. Wilkins, gr. to Lady Theodoria Guest, with a grand lot, including Madame Carnot, Mrs. C. Blick, Graphic, Pheebus, Edith Tabor, Madame Ad. Chatin, International, Duke of York, Mrs. Hume Loug, &c.: this exhibit won the Challenge Vase, in value 12 guineas. 2nd, Mr. J. Maedonald, gr. to W. B. Marlino, Esq., who last year won the Challenge Vase,

There were twelve entries in this class.

Twelve Japanese, Mr. Baker, gr. to Mrs. H. A. Smith, was lst amongst eight who entered in this class with Madame 1st amongst eight who entered in this cass with magame Carnot, Van der Heede, Lord Brooke, Thos. Wilkins, G. W. Childs, Mdlle. Thérèse Rey, Chas. Davis, &c. 2nd, Mr. Pain, gr. to C. Wills, Esq., with Pheebus, Wilfred Marshall, Muthall Friend, Madame Carnot, &c.

Twenty-four incurved, Ist, Mr. Bishop, gr. to H. E. M. Manderden, Esq., having good blooms of C. H. Curtis, Mrs. R. C. Kingston, Golden Empress, Lord Rosebery, Cherub, Empress of India, Lord Aleester, &c. 2nd, Mr. Aplin, gr. to W. M. Baker, Esq., who ran Mr. Bishop close with Miss Haggas, C. H. Curtis, J. Agate, Major Bonnaffon, Globe d'Or, Lord Meater, her Lord Alcester, &c.

Plants.-Group of Chrysanthemums in pots in a space Profits.—Group of Chrysanthemums in pots in a space 10 feet by 6 feet. 1st, Mr. J. Marshall, gr. to J. Dole, Esq., with well-arranged plants possessing large flowers and good foliage, all Japanese varieties. This gained the National Chrysanthemum Society's Jubilee Medal; 2nd, Mr. Bunker, gr. to A. Shipeer, Esq., who mixed through his group a few incurved varieties, thereby slightly marring his exhibit. Group of Chrysanthemums arranged with Ferns and orna-

mental foliage plants, 1st, Mr. Attwell, gr. to J. B. Brain, Esq. : Mr. Newbery, gr. to J. Saunders, Esq. , being a very close 2nd.

Four specimen Chrysanthemum plants, Ist, Mr. Ayres, gr. to Mrs. Gibson, with fine plants of Mrs. Norman Davis, Col. Smith, Mrs. Dixon, and C. J. Agate; 2nd, Mr. Sutton, gr. to W. A. Todd, Esq.

AYLESBURY CHRYSANTHEMUM.

November 19.-The eighteenth annual exhibition of this Society took place on the above date, in the Corn Exchange of this market town. The schedule included thirty-eight classes for Chrysantheniums, and others were devoted to fruit and vegetables. Eighteen classes were devoted to specimen plants, which always form a feature at this exhibition; and on the present occasion the competition was in most classes keen, and the exhibits generally of very good quality. Cut blooms also, more especially the Japanese, were well shown.

In class 1, for nine plants, Mr. Robins, gr. to Colonel Lee, Hartwell House, Aylesbury, was 1st, with fine plants in excellent condition; 2nd, Mr. Hopkins. For six plants, Mr. Turnham, gr. to Mrs. Bartlett, was 1st; 2nd, Mr. Purnell,

gr. to H. Gunn, Esq.
In the class for Japanese, some beautifully-grown plants were staged by Mr. Brandon, gr. to Mrs. Gunney, who was lat for three; while for six Japanese or Anemone-flowered, Mr. Tipler, gr. to Miss Sattle Dornten, was a good lat, having, among others, fine Secur Dorothée Souillé and W. H. timedn. 2nd Mr. Turney, an

Lincoln; 2nd, Mr. TURNHAM.
Pompons were very good, Mr. Brancon being easily 1st fo

eix, with very fresh and admirably-bloomed plants of Orange Beauty, White Cedo Nulli, and Rosinante, among others; 2nd, Mr. Robins.

Groups for effect were not a strong feature; in the largest class, to cover 80 square feet, only two exhibitors competed,

Mr. Tipler was 1st, and Mr. Horkins 2nd.
Cut blooms were allotted fifteen classes, the most important heing that for forty-eight distinct, half to be Japanese and half large-flowered. Several competitors staged. Mr. TURNHAM was a good 1st.

For thirty-six blooms, Mr. Clark, gr. to T. Gurney, Esq. was 1st, Mr. Hopkins 2nd. For twenty-four incurved, 1st, Mr. TURNHAM; 2nd, Mr. TURNHAM; 2nd, Mr. TURLER.

In the class for twenty-four Japanese the competition was

keen, and some good stands were staged, and Mr. Turnham was 1st; Mr. Warren 2nd, also with good blooms.

A class devoted to hairy varieties brought some interesting flowers, the best being Esau (a pretty pink), Hairy Wonder, Mrs. Dr. Ward, Prima Donna, and white L. Beehmer; for these Mr. Tunnham was 1st.

NEATH CHRYSANTHEMUM.

NOVEMBER 19.-This society held a very successful show in Gurfro Hall, on the above date. Chrysanthemum blooms were the chief feature. The incurveds shown by Mr. DUMBLE, who was a remarkably successful exhibitor, being equal in quality to any that were shown at Bristol on the previous day. Groups of Chrysanthemums, and also of Chrysanthemums intermixed with ornamental foliage-plants, were also good. There was nothing of special merit in the classes for fruit, but vogetables were well shown.

Cut Flowers. - Twenty-four blooms (twelve Japanese, twelve incurved); 1st, Mr. Dumble, gr. to Sir C. Phillips, Picton Castle, Havertordwest, with fine blooms, well finished, and beautifully coloured.

Twelve incurved: here Mr. DUMBLE was placed 1st, with a fine even lot.

Twelve Japanese, Mr. Gilbert, gr. to Mrs. G. LLEWELYN, was placed 1st in this class.

Group of Chryswathemums in Pots. - 1st, Mr. H. Bradly, gr. to Mrs. Gwin, The Duffryn, who had a well arranged let of dwarf plants with large flowers.

STONE HORTICULTURAL.

NOVEMBER 19.- This Society, which has been resting with a balunce in hand for several years, held its first Chrysanthemum Show, at Stone.

As a first attempt of this kind, the show was considered a very successful one. The prize list was not a long one, and competitive exhibits did not form the chief exhibits. On the centrary, honorary exhibits made a very fine display, notably the fine Orehids from Mr. Thomson, of Walton Grange. Opposite to this lot, and at the end of the hall, Messrs, Jenkins & Sons, of Newcastle, exhibited a fine collection of cut flowers in baskets, some bouquets, consisting of Orchids, wreaths, and other thoral designs, together with Roses, Lilies of the Valley, and the old white Pelargonium Volonte, international Chrysanthemums, and other flowers Mrs. Meakin, of Darlastou Hall, sent a group of Chrysantho-mums, as also W. R. Parker Jervis, near Mesford Hall; Major Hardins, Manor House, Stone; Mr. Tams, The Hayes, Stone, all of whom had well-arranged groups distributed Stone, an or whom had wen-arranged groups distributed round the hall. Mr. Walter Little, nurseryman, Stafford, showed floral designs Mr. R. Kinderben, the Cedure, Stone, sent a collection of cut Chrysanthemum blooms. Some fruit was also shown Mr. A. Evyks, Stone, bad Apples and Pears. Mr. W. Lewis, Stone, showed much fruit not in competition

A flower stall, in aid of the Gardeners' Orphan Fund was promoted by Mr. Stevens, assisted by Miss Evans and Miss Lewis, who by their efforts made the public acquainted with this excellent charity.

NORFOLK AND NORWICH CHRYS-ANTHEMUM.

NOVEMBER 19, 20, 21.-This exhibition took place in St. Andrew's Hall, and a large side hall, as well as a temporary building, were utilised for the purpose. It was not only regarded as one of the largest, but also one of the best the Soc'ety has yet held. Plants, though not striking, were yet upright-grown examples, carrying good blooms in the ease of the Japanese varieties. In addition, Cyclamens, Chinese Primroses, &c., were exhibited in their several classes.

The prime attraction of the show was the class for forty-eight Japanese, distinct. Mr. W. Messenger, gr. to C. H. Berners, Esq., Woolverstone, Ipswich, with a superb co lec-tion, fresh, well-coloured, and even, some of the blooms extraordinarily fine, in particular Madame Carnot, which was awarded the Silver Medal of the National Chrysanthemum Society. Mr. T. Hansen, gr. to Sir Saville Crossley, Somerleyton Hall, was a good 2nd.

The best thirty-six blooms, eighteen Japanese, and eighteen incurved, came from Mr. J. Shiddeck, gr. to the Hon. A. E. Fellowes, Honingham Hall, who was 1st with a well-balanced collection, the Japanese particularly good, and in all the other cut-flower classes the competition was generally even and close. Charles Curtis was well shown in the incurved class, but the finest bloom in the show was J. Agate, whi h

was also awarded the Silver Medal of the National Chrysanwas also awarded the sheel fledas for new varieties of Japanese sent out since 1892, the best were Mutual Friend, Caddeson, Madame Ad. Chatin, J. Mockar, H. T. Fils, Duke of York, Madame Carnot, and Pheebus. The limited space at disposal will not admit of fuller details.

FRUIT was shown in collections of six varieties, with Grapes, Apples, and Pears, in several classes; the latter were very good, and if the dessert Apples were small, they were brilliantly coloured.

VEGETABLES were a great feature, and some excellent cullections were found competing for the special prizes offered by Messrs. Carter & Co., Sutton & Sons, Daniels Brothers, and others

Miscellaneous collections consisted of a fine collection of Chrysanthemums from Mr. John Green, nurseryman, Dereham; Mr. R. C. Norcutt, Ipswich; Camas, zonal Pelargoniums, Chrysanthemums, &c., from Messrs. H. Cannell & Son, Swanley; with a large stand of flowers, fruit, and vegetables from Messrs, Daniels BROTHERS.

The show was continued for three days, and appeared to be successful in every respect.

MANCHESTER ROYAL BOTANIC.

NOVEMBER 20, 21.—The early winter show in which Chrysanthemums and Orenids form the chief exhibits, was held in the Town Hall, Manchester, under the auspices of the Council of the Royal Botanical Gardens. As a show, though somewhat limited in size, it was brighter, better, and choicer than exhibitions held at the same time in former years.

Chrysanthemome in Pots were well shown by Mr. Thos. HARKER, Brook House, Fallowfield; by Mr. G. H. GAODAM, Adrian House, Didsbury; and Mr R. Hardwn a, Woodley's Gringe, Ashton-on-Mersey, who took positions in the classes they exhibited in the order named. The plants of W. H. Lincoln, Etolle de Lyon, Marie Hoste (very fine indeed. and Viviand Morel being not only abundantly flowered, but the blooms were of first quality.

Cut Blooms.—There was a large competition in cut flowers, the Japanese coming to the front more prominently than the in surved, but the competition in either case was keen. For thirty-six incurved, Mr. J. H. Goodarre, Elwaston, was 1st. and Mr. A. Tate, Leatherhead, being 2nd. The best blooms were C. H. Curtis, T. W. Flight, R. C. Kingstou (goo.); Jas. Agate, excellent white; John Fulford, Miss Haggs, Princess

For twenty-four varieties, Japanese, Mr. A. Tvif, was 1st; Mr. Goodacre, 2nd. The best among the Japanese were Pankoucke, International, Primrose League, Ada Lincoln, C. H. Payne, E. G. Hall, Etoile de Lyon, Chas. Davis, Stan-stead White, Mr. W. H. Lees, Mrs. F. Jameson, Miss Dorothy Shea, Lilian B. Baird, Viv and Morel, Duke of York, Silver King, Nivous (very fine), &c.

For thirty-six inscellaneous cut blooms, Mrs. Bauner, Roby, Liverpool, was 1st; Mr. J. Brocklebank, 2nd.

In the miscellaneous collection of cut flowers, Mr. T. STATTER, Stand Hall, was 1st with Orchids in variety; Miss Lord, was 1nd. Messrs. Cord and Mr. J. Watts, Cheadle, had a miscellaneous assortment of cut stove and greenhouse plants.

The Roman Hyacinths grown and shown in 6-inch pots were a feature, the best coming from Mr. C. H. LAYWORTH, Wilkington, and 2nd, Miss LORD,

Occhids were in great variety, and generally well selected, few of indifferent appearance being staged. There were no prizes offered for them Special Commendations were awarded Cuarlesworth & Co. Heaton, Bradford; Mr. Jas. Cypurk, Cheltenham; Heon Low & Co., Clapton; Heath & Son, Cheltenham, and some others.

First class Certificates were awarded to the following plants :- Cattleya labiata alba and C. l. Ashfield var. The former was one of the choicest white labiatas ever seen, having excellent form to recommend it; peerless white segments, shining like a piece of ivory, and equally white lip, with the blade more ovate than round, and on the crest a sharled yellow blotch—this caused quite a sensition among the experts. The other form is of the richest purplishcrimson, solid in colour, not shaded, with a lip equally solid, of volvety-crimson, broadly edged with cerise -a grand novelty; and the two gens represented the extremes in Cattleya labiata. These came from the collection of G. Shorland Ball, Esq., Ashfield, Wilmslow (gr., Mr.

A. Hay).

The same honours were voted to Thos. Statter, Esq. (gr., Mr. Johnson) for Cypripedium insigne Sanderæ—still a long way ahead of all the other varieties of insigne. The green-and-gold flowers, with the dorsal sepal top adorned with ivory-white, looked all the more charming under the shade of the bell-glass which covered it.

A similar award was made to FRED Holder, Esq., Tyntesfield (gr., Mr. Stafford) for Cypripedium "Fred Hardy," shown the other day at the Drill Hall, which is distinct and noteworthy, but in too weak a condition to prononuce definitely upon.

HUGH Low & Co. had a nice lot of Cypripediums, three of which were singled out for First class Certificates .—

Cypripedium usigne Laura Kimball. This is one of the numerous forms of insigne which has already had an Award of Merit voted it at the Drill Hall, and which received the higher award here. It was a smallish plant, with its flower not fully developed. Its great merit lies in having no spots on its dorsal sepal, and the white at the extremity coming farther down the dorsal than in C. Sandere itself. Its colour and finish, as shown, are not at all equal to those of Sandera.

but there is no doubt it is an exquisite variety.

Cypripedium × Alfred Hollington = ciliolare × lævigatum is a novelty of first rank, having a bold ovate dorsal sepal with chestnut lines radiating from the base to the extremity on a whitish ground at the base of the dorsal clouded with green: the petals are broadish and arching, with the twist of levylgatum the petals are broadish and arching, with the twist of levigatum completely disappeared, and elongated, to form a striking appearance, with dashes and spots of Indian red on a desh-coloured ground. The lip is of good size and well inflated, but in point of colour it is the weakest part of the flower. Cypripedium × Mrs. Tautz, = Chantini × Boxalli. This is a pretty flower, rather under-sized, on a short peduncle, suggesting a dwarf seedling of strong tall-stanoined parents. It has a rhomboid dorsal sepal, with black heavy stats on the lower buffer may buffer in the leview buffer when the leview and the second services are the lower buffer when buffer in the leview and the second services are serviced as the second services are the leview and the second services are the leview and the second services are the leview and the second services are the second second services are the second services are the second second services are the second secon

spots on the lower balf; upper balf bright Indian red, and chestnut-fleeked in the ground colour, and surrounded for one-eighth part of its surface with white; the inferior sepal is greenish, with spots and lines sparsely placed. Petals, fine bronze, with central coloured lines, shortish in the limbs, Staminode large for size of flower, and yellowish.

Messrs. Charlesworth & Co. had a tine lot of Odontogiossum crispum, comprising some extra good forms, also good Cypripedium Charlesworthi, and C.Leeanum giganteum, the pretty C. Niobe, the white Ledia autumnalis, and a general assortment of Cattleyas.

Mr. JAS CYPHER had, as usual, some extra forms of Den-

drobium Phalenopsis Schrodenanum, the pale forms mixing well with some of the most brilliant and dazzling we have yet seen in this way; a golden-tinted Cypripedium Leeanum, the pretty Odontoglossum × Humcanum, some good Masdevallias, and the bright searlet Sophronites.

Messys. Hearts & Son, Cheltenham, had a small lot of Cypripediums, some bright Oncldium varicosum, and several Dendrobes

Messrs, Celeran & Sons, Altrineham, had a good group of cut Chrysanthemams in various sorts; Dickson & Robinson had a fine set of Cyc'amons, so had also Dickson, Brown, & Tair. Other collections were shown which we have no space to notify.

There was a grand assortment of Apples from John Laing & Son, Forest Hill, Sydenham, shown in the entrance hall, and which was much admired

EDINBURGH HORTICULTURAL.

NOVEMBER 19, 20, 21. The great Chrysanthemum Exhibifrom of the Scottish Horticultural Association, held in the Waverley Market, Edinburgh, on the above dates, proved perhaps, the most successful of the series,

CHRYSANTHEMUMS.

Among the Special Prizes offered was one of £30 by the City Among the Special Prizes offered was one of £30 by the City of Edutourgh for forty-eight blooms of Japanese Chrysanthemiums distinct, with a 2nd prize of £12, a 3rd of £8, a 4th of £5, and a 5th of £3. There were six entries for this class, which should, perhaps, for importance have led off the schedule. This, like most of the important classes for cut flowers, was confined to private gardeners and amateurs only. The Scottish Challenge Cup, value 15 guiness, to be held for the year by the winner of the first prize in class 20, of £5 for the best twenty-four blooms of Japanese Chrysanthemums distinct, 2nd prize in this class £4, 3nd £3, 4th £2, 5th £1, had ten entries. The same Association offered several special Silver and Bronze Medals for the best and second best Chrysanthemnums not in commerce, for the best Chrysanthemnum plant in classes 1 to 12, for the best plant in classes 13 to 17, for the best menived bloom in the exhibition, best Japanese bloom in the exhibition, for the best Japanese bloom in classes

The same Association offered their Gold Medal, or plate of qual value, and their Silver Medal for 1st and 2nd prizes for a table of home or foreign fruit, ripe or unripe; plants and flowers might be used; quality, variety, and effect to be taken into account. Unfortunately, in this most suggestive and into account. Choreunacity, in this most suggestive and interesting class there were no entries. The Association also effected their Silver Medal and a lst

The Association also detect their Silver Medal and a 1st puze of 3 guineas for the best collection of ten distinct kinds of vegetables, three other prizes being given in this class of 40s., 30s., and 20s. Some additional lifteen extra prizes were given by other patiens, ranging from 1 to 3 guineas, in kind or cash, that added greatly to the popularity and success of the show.

Turning to the regular schedule, the prizes for Chrysanthemums alone, including exhibit 75, group of Chrysanthemum toliage and other flowering plants, arranged for effect on the floor 10 feet in diameter, Chrysanthemnus to be the leading feature, for which £5, £3, £2 and £1 were offered, amounted to hfty-seven.

Prizes for other plants, seventeen; for finit, twenty-six; for vegetables, twenty-one. The more noticeable features in the general schedule were the market growers' group of Chrys the general schedule were the market growers' group of Chrysauthennums, arranged for effect, to occupy not less than 100 square feet; the nurserymen's, thrity-six Japanese Chrysauthennums, arranged for effect, to occupy not less that 100 square feet.

Collections of counters and other hardy plants in pots, tubs, and baskets, arranged for effect, and eight specimen Palms in not more than 14-inch pots or tubs; the prizes in each of

these classes being alike 10ks, 60ks, 20k.

Two or three of the more notable features of the schedule and on show were the handsome Cake Basket offered as a lst prize for a circular table, four feet in diameter, arranged with Chrysanthemula blooms, blooms in glasses and vases, and interspersed with Ferns and other foliage plants (eight

Four vases, Japanese Chrysanthemum blooms in each, Chrysanthemum foliage only used, £3, £3, £2, £1.

Ten show vases, Japanese Chrysanthemum blooms in twelve varieties, three blossoms of each Chrysanthemum, foliage only to be used, \$7, \$6, \$2, \$4, \$1. A Silver-gill Medal presented by H. J. Jones, Ryccroft Nursery, Lewisham, to go with the 1st

Pilze.

The Judges were for Cut blooms, Mr. E. Molyneux, Swanmore Park, Hants; for plants; Mr. D. Henderson, Castle Wemyss, Wemyss Bay; Mr. W. H. Gorrie, Mauldslie Castle, Carluke; for fruit: Mr. W. Henderson, Balbirnie, Markinch; Mr. Thomas Lent, Ardgowan, Inverness; for vegetables; Mr. Verne, the Hand Cabletron and Mr. Richtoften. JOHN CAIRNS, the Hirsel, Coldstream, and Mr. Richards Cairns, Balruddery, Longforgan.

Cairns, Balruddery, Longforgan.

The show was publicly opened on the 19th inst, by the Lord Provost in the presence of a goodly company, when Later McLare presented the Corporation Cup for forty-eight Japanese Chrysanthemums to Mr.McHattie, of Strathfieldsaye, Hampshire, a Scotch gardener (who used to live with the Marquis of Lothian, and take the same prize there, remarking that while she regretted this Cup was leaving Scotland, she was glad that it had been won by a Scotsman, and that the reputation of Scotch gardeners was being maintained in reputation of Scotch gardeners was being maintained in

England.

The prize takers in this Prender Class were: 1st, Mr. McHattie, Strathfieldsaye, Hampshire; 2nd, Mr. James Beisant, Castle Huntly, Langforgan; 2nd, Mr. James Martin, Cornsdear, Hall, Winchcombe; 4th, Mr. J. Carruthers, Hillwood, Coristorphine; 5th, Mr. D. Nicolla, Rossie, Forgandemy, Most of these fruits contained many beautiful bluence. blooms

For the Scottish Challenge Cop Prize for twenty-four blooms, Japaness Chrysonthemans, there were eleven entries. Mr. Addison being 1st, Mr. J. Lunt, 2nd, Mr. D. Nicoll, 3rd, Mr. G. Dav, 4th, and Mr. Beisanr, 5th.

In the next class for twelve Japanese, there were fourteen competitors, doubtless stimulated by the Silver Medal offered by the great Chrysanthenium grower, Mr. H. J. Jones, of the Ryecroft Nurseries, Lewisham, Mr. Lung secured the Medal and the 1st prize, Mr. Addison being 2nd, and Mr. G. Martin,

For the class for twelve Japanese, three of each, there were twelve competitors, the prizes going as follows: 1st, Mr. M. Ardison; 2nd, Mr. J. Martin; 3rd, Mr. Lent.

The reduction of the number of Japanese (distinct) raised

the number of competitors to twenty-three, Mr. Lung being 1st, Mr. Paterson 2nd, and Mr. J. R. Pearson 3rd.

Classes 24 to 40 in the schedule, were devoted mostly to blooms in Chrysauthemums of named sorts, and added much to the interest of the Exhibition.

The artistic display of cut flowers of Chrysanthemums in

vases to furnish tables, with their own and other foliage, formed a most interesting feature of this great show, but the

formed a most interesting feature of this great show, but the details of which our space forbids us to give.

Class 47. A circular table four feet in diameter, Chrysanthemum blooms in glasses, interspersed with Ferns and foliage plants (eight entries). Ist prize (by Messrs, Bacon & Soxs), George-street, Edinburgh), A. Bocin; 2nd, Mr. Kidd; 3rd, Mr. JARDINE. The tables were tather too much alike and all, save one, draped alike with Panieum variegatum, the one exception being the pretty green Smilax, a welcome change. All had a graceful Palm in the contract and the one exception being the pretty green omnax, a weream change. All had a graceful Palm in the centre, and the Chrysanthemums stood up with a base of Maiden-hair and other Ferns, Mr. JARDINE having a few graceful plants of

Eulalia japonica variegata in addition.

Near to these a large table well filled with antinum leaves. Truits, berries, and ones, was prettily arranged by Mr. Chombin, gr. to Viscount Powerscourt, Ireland. On the other side of the hall Mr. M. Todd, with a staff of ladies, were busy selling a quantity of pretty Grasses, plants, &c., for the benefit of the Gardeners Orphan Fund, which we trust added substantially to its funds.

Want of space compels us to omit several other classes for ent flowers, or to find room to notice some of the finest blooms in the show on the large table so richly furnished by Mr. H. J. Jones, of Hither Green, Lewisham.

Two of the many raised or introduced by Mr. Jones were certificated at this show—Charles D. Massey, a pleasing shade of primrose, and M. P. Purnell, violet rose inside with silvery white reverse, and having like petals of good substance incurved and curled.

The most cursory observer of the signs of the times cannot fail to note that the incurved varieties, the Anemones, Pompon, and other sections of Chrysanthennans are on the down grade, and that the Japanese are all the rage. Further, that the latest tashions point to races of hirsute flowers, on the lines of Hairy Wonder, of which type we are assured there are already a

score varieties.

Among the incurved flowers shown, the Duchess of Fife a sort of mixed torm, however—took an easy lead. Queen of England, Alfred Salter, C. W. Curtis, Agate, Lord Rosebery. Lord Alcester, were among the best.

Chrysanthemum plants were remarkably well done, the local Chrysinthenian plants were tenankardy well done, the focal champion, Mr. Cayannen, of St. Edmonds, Murrayticld House, Edinburgh, being 1st for four Japanese, 1st for one orange, yellow; 1st for one crimion; 1st for one bronze; 2nd for two pots, and 2nd for six pots Japanese; the last, the premier prize for plants, in which not a few local growers and others the orght Mr. Cayanagan 1st, being the only decision we heard outschool in the local growers are questioned in the show.

FRUIT

s always worth seeing in Edinburgh. Mr. Leslie, of Pet-cullam House, Perth, took 1st for four bunches, 1st for two dozen black and white, 1st for two Muscat of Alexandria, and 1st for two Alpante.

The Apple Classes were extremely one and well filled, the

entries ranging from six to twelve in the different sections.

There were fewer Pears, but the prize lots, especially the 1st and 2nd, were fine. There were four entries for six varieties of Apples, one peck of each, as sent to market, ripe or unripe. some of which were very fine; but they needed more careful grading and sightly packing to enable them to command the markets or allure the grocers from American, Canadian, Tasmanian, or other foreign imports.

Fine, too, as the Scotch Apples were, they were eclipsed in colour and excelled in size by the magnificent collections of Apples from Mr. George Bunnard, of Maidstone, Kent, and of John Watkins, near Withington, Hereford. Both these or John Watkins, near Withington, Hereford. Both these gentlemen also showed new varieties of great merit, Mr. Watkins's Byford Wonder, a culinary Apple in season from November to March, equal to Peasgood's Nonsuch, and Lord Hudlip, a fine dessert Apple, from January to May, to follow

Ox's Orange Pippin, and equal to it or nearly so, in quality.

Mr. Bunyan's Allington Pippin is said to succeed where the
Orange Pippin fails, and it is a first-rate dessert Apple—it
h s received a First-class Certificate from the Royal Horticultural Society,

VEGETABLES

were good, and plentifully shown in Leeks and Onions. Celery large, but somewhat green. Beetroot in quantity, wholly carret-rooted. Turnips, twenty entries; Golden Ball, one. White Tomato-Potatos, fine, clean, medium sizes, and clear of disease. Neither Salads nor Mushrooms were up to the

highest level of culture on showing.

Before dismissing vegetables, it may be stated that Mr.

John Ireland, of George Street, made a nice show of Potatos in the rough. And here also were an interesting collection of Potatos that Lord Roseberg has been experimenting with at Palmeny, among the most promising of which for his soil being reckoned Mr. Finlay's Up-to-Date, which yielded 10g tons, and main crop 13 tons per acre.

tons, and main crop 13 tons per acre.

The trade, as usual, rendered hearty support to the show, Mr. Thos. Fordunes, of Queensberry-road, leading the way in an artistic stand of unique grace and beauty, representing floral harps and other designs of grace and elegance, furnished with Carnations, Acacias, Roses, Cattleyas, Valley Lilies, draped with Asperagus Ferns, Smilax, etc.

The Messrs, Laire furnished a fine group of Conifers in perfect health and great variety and beauty; Messis, Laire & Mathers, of Kelso, a table richly furnished with Malmaison Carnations, grouped with Chrysanthemums between, fringed with Ferns, and positively illuminated with the brilliance of the new single Chrysanthemum-Princesa May—which all must grow next year. must grow next year.

Messrs, JAMES Dickson & Sons, staged a nice collection of Shrubs and Conifers, which supply a welcome verdure to the brilliance of the flowers.

Mr. Campbell, nurselyman, High Blantyre, showed a rich mixture of Carnations and Onions, set as a tringe in vases on a ease of Maiden-hair Ferns.

Mr. John Downie, Prince's-street, had a fine table of Palms, Heaths, Ferns, Roman Hyacinths, Early Lilies, Cyclamens, Pandanus japonica variegata, and others, edged with a narrowleaved grass

Messrs. Dobbie & Son were again in strong evidence with Potatos and Onions, as well as a fine arrangement of choice Chrysanthenums (Japanese), and quite a large collection of single and decorative varieties, artistically blended with

Palms, Ferns, &c Messes, J. & B. Thyne, of St. Vincent street, Glasgow, were strong with Palms, skilfully used, and giving verture to the numerous white brilliant Cyclamens of the imperial strain, and very fine Lily of the Valley, make a very satisfactory

Mt. Forbes, mirseryman, Hawlek, showed a fine stock of his searlet Yuletide Carnations, full of buds, which looked,

nis searret Thierae Carnatons, that of boos, which hooked, perhaps, all the brighter with the charming winter-flowering pink Begonias, Gloire de Lorraine.

— Mr. Киж, of the Forth Vineyard, was there also, pushing his new industry or trade in autumn leaves, which seems prospering quite fast enough for his Grapes and Vines,

CONIFERE IN FRUIT.

One of the most interesting and attractive features in an otherwise notable exhibition, was the remarkably fine collection of specimens of Conifera in Fruit exhibited by Mr. David Crombie, gr. to Viscount Powerscourt, at Powerscourt, Co. Wicklow, Ireland. The specimens were well selected to illustrate the characteristics of the species and generally bearing an abundant crop of cones, or drupes, they formed a very artistic and unique table, and were a centre of attraction to crowds of admirers during the three days the Show was open. They were effectively set off by sprays, a few species of brilliant berried trees and shrubs, such as the Strawberry Tree, Arbutus Unedo, with numerous clusters of its searlet berries, which so much resemble medium-sized Strawberries; Arbutus Andrachne, from the Levant, with large clusters of small yellowish berries hanging in strings nearly a foot in length; Pernettya mucronata, with neat foliage, and branches thickly clustered with various coloured berries; the sweet Bay, Laurus nobilis, with a line crop of glossy black truit the size of Morello Cherries; and sprays of the curious berned spindle free, Euonymus europseus, with several species of climbers and trailers creeping round and hanging over from three tall vases, set along the middle of a table about 25 tect in length,

and giving the whole a meely-finished effect.

The collection compused upwards of sixty species of Comtene, with about twenty other species of trees and shrubs, all bearing fruit; and the whole were set off by about a couple of dozen of handsome dishes of choice varieties of Apples and other fruits, placed in a line round the margin of the table. As the whole collection, was clearly and distincty named, the display was highly instructive as well as attractive.

Among the more notable specimens of the Conifera, Abies magnifica was conspicuous by its massive dark-brown cones.

fully 9 inches long by 3 inches in diameter, in fine contras with its rich silvery foliage and symmetrical habit. A. Webbian, with dark purple cones, 7_2^* inches by 2_2^* inches; A. Pindrow, with similar but smaller cones; A. cephalonica, A. I marrow, with similar role smaller cones; A. eephadonea, A. nobilis, A. concolor, A. balsamea, A. brachyphylla, A. firma, A. Fraseri, A. Pinsapo, A. Nordmanniana, and A. pectinata; Picea alba, P. nigra, P. Menziesii, P. Morinda (Smithiana); very handsome cones; P. polita, and P. orientalis, one of the prettiest coned in the collection; Tsuga Menziesii (Albertiana), T. Brunoniana, T. canadensis, and Pseudotsuga Douglasii; Araucaria inbricata, with very fine male and female cones; Cedrus atlantica, C. Deodara, and C. Libani; Cephalotaxus drupacea, with curious plum-like fruit; Cryptomeria japonica, C. j. elegans, and C. j. Lobbi; Cupressus funcbris, japonica, C. J. elegans, and C. J. Lobbi; Cupressus Innebus, C. Lawsoniana, C. morrocarpa, C. thyoides variegata, and C. torulosa, Fitzroya patagonica, very nicely fruited; Juniperus recurva, J. virginiana glauca, J. Sabina, and J. sinensis; Larix leptolepis; Pinus densiflora, P. insignis, handsome cones remaining on the tree for years; P. Cembra, P. Pinaster, fine clusters of cones; P. excelsa P. montriol, and P. Stradus three bandsome Pines excelsa, P. monticola, and P. Strobus, three handsome Pines with cones somewhat resembling each other, and P. Jeffreyi, and P. ponderosa, with large and handsome cones produced freely on both species; Retinospora filitera, R. obtusa, and freely on both species; Retinospora filifera, R. obtasa, and R. pisifera; Sequoia sempervirens, Taxodium distichum, Taxus baccata with a fine crop of rich golden yellow berries, in pleasing contrast with the dark foliage; Thuja gigantea, Thuiopsis borealis; and last, but by no means least, Sequoia gigantea, with a profusion of cones of unusual size, clustering on vigorously-grown branches, showing the Wellingtonia is evidently at home in the south of Ireland. Sprays of Quereus glabra were finely fruited, and the Laurustine, Viburium Tinus, was shown in full flower, and at the same time bearing bunches of its dark-coloured shining berries, in the midst of its pretty heads of flowers.

The arrangements throughout were most creditable to the Committee and to Mr. Robert Lairn, the Secretary, and Mr. J. H. Murray, the Assistant-Secretary.

NATIONAL CHRYSANTHEMUM. Floral Committee.

NOVEMBER 25.—This body met at the Royal Aquarium on the above date, but only a few novelties were forthcoming.

First-class Certificates of Merit were awarded to Japanese C. W. Richardson, a clear yellow variety, with somewhat in rurving, but with drooping basal petals—a variety promising to be of value for exhibition purposes, from Mr. E. Beckett, The Gardens, Aldenham House, Elstree. Also to Anemone Pompen Gem of Earlswood, from Mr. W. Wells, described in our report of the meeting of the Royal Horti-cultural Society. Single Chrysanthemum Ethelwhyn, a spider-formed blush variety, having twisted thread-like petals, and very free, was commended for decorative pur-

poses, a good bunch as well as plants being exhibited.

A Special Committee is on the point of being formed to consider the position to be allotted to the American incurved varieties.

Obituary.

WILLIAM YOUNG .-- We are sorry to have to record the decease of the late Mr. William Young, one of Scotland's best-known and most successful amateur florists. He passed away after a protracted and suddenly-terminating illness ou November 12, at the ripe age of eighty, and his remains were followed to their resting-place by a numerous company of strictly his horticultural friends. For more than half a century he was widely and well known as an enthusiastic and successful raiser and cultivator of such florists' flowers as Pansies, Pinks, Carnations, Auriculas, &c., all of which he raised and cultivated with marked success, considering that his operations were conducted under the adverse influence of city smoke. It was he who, amougst numerous other outstanding things, introduced the original Malmaison Carnation, which, with its varieties, now hold so conspicuous and large a space in the gardens of this and other countries. Many other superior things were raised and distributed by him.

For the long time mentioned Mr. Young kept iu close touch with all the leading florists and gardeners for a very wide radius around Edinburgh, and wherever there were samples of the flower he so devotedly cared for, these were his frequent haunts. He was always ready to give and take cuttings and seeds of his much-cherished and loved favourites. Every spare moment was devoted to their propagation and culture, and he was never so much in his element as whon associated with gardeners, and in discussing the details of floriculture. He was a shoe merchant by trade, but his heart was much more with Queen Flora than with King Crispin.

For nearly half a century Mr. Young was known to mauy as, first, the Assistant-Secretary to the Edinburgh Horticultural Society, and afterwards as holding the same post in the Royal Caledonian after the two amalgamated. This society has successfully established itself as one of the most successful in every way in Britain, and it must be admitted that much of its success has been due to Mr. Young's enthusiasm, and to the untiring energy that he brought to bear on its development and arrangement. Many years of the latter part of his life were exclusively devoted to the interests of the society. To those who did not know him intimately, his bearing at times might appear rather abrupt and imperious, but nevertheless his well-known kindness and genial nature made him a decided favourite with those who knew him most intimately. If at times he might wound the impatient and troublesome exhibitor, his bark was always worse than his bite, and he was ever ready with the salve of cheery kindness. He will be much missed, and his memory cherished by many to whom he has done a kind and generous service.

a m accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fabr. for the period named: and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending November 21, is furnished from the Meteorological Office:-

"The weather was unsettled and rainy in all parts of the kingdom at the commencement of the week. The conditions, however, soon improved in the south and east, and later on, fine, dry weather extended to almost all districts.

"The kinghestage was again a little above the mean over Scotland, and also in 'Ireland, N.,' but continued rather below it elsewhere. The highest of the maxima were recorded during the latter part of the week, when they ranged from 55° in 'Ireland, N.,' and the 'Channel Islands,' to 51° in 'England, E., and the 'Midland Counties.' The lowest m England, E., and the 'Midland Counties.' The lowest of the minima were registered on very irregular dates, and ranged from 22° in 'England, N.E.,' and 23° in 'England, S.W.' (at Llandovery), to 30° in 'Scotland, N.,' and to 30° in the 'Channel Islands.'

"The rainfall was less than the mean in all districts; over the cast and south of Great Britain the fall was very slight.

"The bright sunshine exceeded the mean in nearly all parts of the kingdom. The percentage of the possible duration ranged from 17 in 'Scotland, N. and E.,' to 35 in 'England, S.' and the 'Channel Islands,' 36 in 'England, S.W., and 40 in 'England, E.'"

MARKETS.

COYENT GARDEN, NOVEMBER 26,

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.

Trade this week much firmer. Prices remain about same as last report. J. B. Thomas.

SEEDS.

LONDON: Noc. 25. - Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., describe to-days seed market as bare alike of buyers and of business. Clover seeds for the moment, meet with but scanty attention; values, nevertheless, keep steady. For Perennial and Italiam Ryo grasses there is a fair sale. Winter Tares offer on tempting terms. By continues scarce. The new Canadian Haricots just landing come cheap and good Wisconsin Boiling Peas commund full rives. Bird seeds are at present neglected. There is no change in either Mustard or Rape seed. Windsor and Longpod Brans, are this season very reasonable.

FRUIT AND VEGETABLES.

GLASCOW: November 25. - The following are the averages of the prices current at this market since last report:—Fruit; Pears, 6d per lb.; Apples, 1s. to 2s. 6d. per stone; Tomatos, Pears, 6d per lb.; Apples, 1s. to 2s. 6d. per stone; Tomatos, Guernsey, 5d. per lb.; do., Scotch, 6\frac{1}{2}d. do.; Grapes, home, 1s. to 2s. do.; do., foreign, 6d. to 1s. do. Vegetables: Turnips, white, 2s. to 2s. 6d. per dozen bunches; Savoys, 1s. to 1s. 3d. per dozen; Cabbages, 8d. to 9d. do.; do., late, 1s. to 1s. 6d. do.; do., Red, 2s. 6d. to 3s. do. Cauliflowers, Dublin, 2s. to 2s. 6d. per bushel; Parsoips, 4s. 6d. per ewt.; Herbs, assorted, 1d. to 2d. per bunch; Lecks, 1s. to 2s. 6d. per dozen bunches; Mint, 6d. per bunch; Onions, Dutch, 3s. per bag; do., Portugal, 1s. per stone; do., Globe, 3s. to 3s. 6d. per ewt.; Parsley, 5s. to 6s. do., Globe, 3s. to 3s. 6d. per ewt.; Parsley, 5s. to 6s. stone; do., Globe, 3s. to 3s. 6d. per ewt.; Parsley, 5s. to 6s. do.; Greeos, 4d. per bunch; Celery, table, 2s. per bundle; do., common, 9d. to 1s. do.; Potatos, 8d. per stone; Carrets, 2s. 6d. to 3s. 6d. per ewt.; Artichokes, 10s. to 14s. do.; Cucumbers, 4s. to 4s. 6d. per dozen; Lettuces, round, 6d. to 9d. per doz.; do., French, 1s. do.; do., Cos, 9d. do.; Radishes, 9d. to 1s. per doz. bunches; Horseradash, 2s. to 3s. per bundle; Mushrooms, 1s. to 1s. 3d. per lb.; Bectroot, 6d. per doz.; Cress, 3d. per basket; Brussels Sprouts, 1s. 6d. to 1s. 9d. per stone.

Liverroot: November 25.—Averages of the prices at the various markets to date: St. John's: Potatos, 8d, to 10d, per peck; Grapes, English, 1s. 6d, to 2s. 6d, per pound; do., foreign, 6d, to 8d, do; Pines, English, 4s. to 8s. each; Mushrooms, 1s. per pound. Birkenhead:—Potatos, 6d, to 8d, per peck; Grapes, English, 2s. to 3s. 6d, per pound; do., foreign, 4d, to 6d, do.; Pines, English, 4s. to 8s. each. North Hay: Turnips, 19s. to 20s. per ton; Potatos, Imperators, 1s. 4d, to 1s. 10d, per ewt.; Giants, 1s. 8d, to 1s. 10d, do.; Main Crop, 2s. 6d, to 3s. 6d, do.; Sutton's Abundance 1s. 8d, to 1s. 10d do.; Bruces, 1s. 10d, to 2s. 3d, do.; Turnips, 6d, to 9d, per dozen bunches; Swedes, 1s. to 1s. 6d, per ewt.; Carrots, 6d, to 8d, per lozen bunches; do., 2s. 9d to 3s. per ewt.; Onions, English, 1s. 6d, to 5s. 6d, per ewt. do. foreign, 2s. 9d, to 3s. do.; Parsley, 4d to 6d, per dozen bunches; Canlidowers, 1s. 6d, to 3s. per dozen; Cabbages, 6d, to 1s. 3d, do.; Celery, 8d, to 1s. 6d, per dozen. LIVERPOOL: November 25 .- Averages of the prices at the

CORN.

Average. Prices of British Corn (per imperial qr.), for the week ending November 21, and for the corresponding period in 1895, together with the difference in the quotations. figures are based on the Official Weekly Return :-

- We have received numerous reports of Chrysanthemum shows, which we are quite unable to notice in the present issue, through insufficiency of space.
- A CORRECTION. Some new varieties of the Rose. The passage on p. 624 should read :- "Muriel Grahame, described as a valuable variation from that prolific parent of modern Tea Roses, Catherine Mermet, I have not yet seen; but I hope ere long to have this gratification."
- The books you mention can only Books: E, M. be obtained at the second-hand book dealers. Some of them are in the Lindley Library, and may be consulted there.
- BROWNING OF THE LEAVES OF CAMELLIAS F. B. Not a fungous malady, but the effect of injurious fumes, sulphur, coal or coke smoke, or lighting
- CHRYSANTHEMUM: J. T. The form that is objected to may be peculiar to the variety, or it may be due to "taking the bud" at the wrong time. Read Mr. E. Molyaeux's Chrysanthemums and their Culture, published at 171, Fleet Street, E.C. (Journal of Horticulture Office).

CHRYSANTHEMUM FROM SEEDS: G. M. M. The fertilisation of flowers and the saving of seed are but little practised in this country, owing to the uufavourable nature of the climate, but are mostly carried out in southern Europe-Madeira and Algiers. You may ask us any questions you please in reason if they touch upon horticulture, and we will reply to them if we can do so.

HARES AND FRUIT TREES: B. G. Protect the stems with rabbit-proof wire, deal rods tied on the stems about I inch apart with iron wire; or smear them with a mixture of clay, lime, and cow-dung, into a pailful of which a wine-glass full of spirits of tar is put, and well stirred. This will not harm the Whatever is used should reach to at the least 4 feet from the ground.

INSECTS IN CUCUMBER HOUSE: C. B. W. & Co. The insects sent are woodlice and millipedes or false wire-worms, both of which exist on living, but preferably dead or decaying vegetable matter, and doubtless they have been introduced with partially decayed leaves or leaf mould, or stable manure. The millipedes may have come in with the soil of which the beds chiefly consist. Wherever the insects are present to the soil, it should be carefully looked over, and if it could be exposed to a bed of strougly fermenting stable-dung in a close pit, many of the eggs and insects would be destroyed, or it might be treated with boiling water, although that would not be so certain in effect. Dung might be similarly treated, and that from old Mushroom beds rejected for the purpose of making up Cucumber-beds. In addition to what you have done the woodlice may be thinned in numbers by persistently pouring boiling water at night into all likely cranuies, and crevices under stones, slates,

LARVE ON ROOTS OF CABBAGE: W. R. The larve sent for inspection are those of a white millipede—Julus guttatus, one of the so-called "false wireworms." It feeds on the roots of plants and decayed vegetation, which accounts for your finding them on the clubbed roots of Cabbages, on fallen Apples, on Potatos, &c. It is not so injurious as the true wire worm, which somewhat resembles it; but the same means may be adopted to rid the soil of it as are found efficacious with that troublesome pest.

MARGUERITE LEAVES MINED: W. S. The work of the larve of a fly: pick off the leaves and burn them if badly affected, but smash the grab with finger and thumb if it has only just began to make its galleries.

MARKET PEARS AND STRAWBERRIES: J. M. Pears to sell from the trees: Doyenné d'Été, Jargonelle, William's Bon Chrétien, Beacou, Hessel or Hazel, Aston Town, Beurré de Capiaumont, Eyewood Aston Town, Beurre de Capialmont, Eyewood Lammas. For sale iu boxes: Beurré d'Amanlis, Doyenné du Comice, Beurré Superfin, Pitmaston Duchess, Beurré Hardy, B. Bosc, Clapp's Favourite, Louis Bonne, Duchess d'Angoulème, Emile d'Heyst, Beurré Hardy, Josephine de Malines, Beurré Buisson. Strawberries: Black Malines, Beurré Buisson. Strawberries: Black Prince, King of Earlies, Keen's Seedling, Noble, Pauline, Vicomtesse H. du Thury, La Grosse Sucrée, Joseph Paxton, James Veitch, Sir C. Napier, Royal Sovereign, Elton, Stirling Castle, Dr. Hogg, and British Queen; where it succeeds, Presideut.

MEALY-BUG ON VINES: Market Gardener, not the Vines, by so doing. Clean the rods of loose bark, and wash them with soft-soap and hotwater. Atterwards painting them with Gishurst Compound Soap, dissolved in water, at the rate of 3 to 4 oz. to I gallon of water. Paint and whitewash all woodwork and brickwork, and remove the upper crust of soil. This must be followed up for two or three years, and a sharp eye kept for stray bugs during the summer, touching the clusters with methylated spirits. In the summer season try Richard's XL All Compound. It will do no harm to the Vines, and may kill many of the insects.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—F. H. (*) Doubtless the plant is a Cucurbit, but we cannot say which one from your drawing. Send a specimen, and we will try to identify it. -J. Hudson, Cambs. Oncidium tigrinum. It should have more heat than that of the cool house whilst making its growth. -R. N. H. Oacidium prætextum, a species varying in colour from olive-green to brown, but always having the slight yellow margin more or less clearly defined B. B. Cattleya intermedia.—Mrs. Briggs, Bury. Cattleya intermedia.

NAMES OF FRUITS: Sir C. W. Strickland. 1, Huyshe's Victoria; 2, Beurré Rance.—J. G. Pears: 7, 8, Maréchal de la Cour; 9, Marie Louise d'Uccle; 10, Flemish Beauty. Apples: 1, Beauty of Kent; 2, Besspool; 6, New Hawthornden; 3, 4, not recognised.—S. J. 2, Gascoigne's Seedling; 3, 4, Blenheim Orange, good; 5, not recognised. excellent quality; 6, Royal Somerset.

Poinsettias Losing their Leaves: G. T. The leaves fall from a variety of causes, such as lack of water or too much at the root, insufficient heat or ventilation, a too light potting soil, crowding the plants together or with others. We think that you kept the plants till too late a date in the cold pit.

RED-SPIDER: C. S. The age to which red-spider (Tetranychus telarius) lives is not known, but it is probably only one year. The egg is oval, colourless, and is found among the webs on the leaves of the plant it fastens upon; and in the case of the red spider ou Limes, frequently in heaps at the foot of the boles. The creature hatches from the egg in about eight days, and is much like the parent, excepting in having three pairs of legs, instead of four as in the mature red-spider. The fourth pair comes with the change of skiu. The colour is various, yellowish-white, brick-red, orange, and sometimes, in early life, green. As far as present observations go, the change of colour is due partly to age, and the nature of the food.

SOIL TAKEN FROM A VINE BORDER: N. Y. Z. The border must have contained much organic matter, which has been seized upon by some species of fungus, the mycelium of which has spread through Before the Vines can grow healthily, this soil must be cleared out, and new soil substituted for When the roots of the Vines are dug out, it will be advisable to wash them thoroughly in Bordeaux Mixture, and bind them in damp straw till the new border is ready to receive them. lu this employ pasture-loam not more than one year dug three-quarters; boues, charcoal, and lime rubble one quarter, and if the loam be very retentive, a good proportion of sharp pit-sand may be added. The soil that is put in direct contact with the roots on replanting, may consist of any light kind of stuff, such, for instance, as that which has carried Melons or Cucumbers, mixing with it some sifted horse-dung in a rotten state.

AND SIXPENCE FOR EVERY ADDITIONAL LINE. If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, 28; Half Page, 24 10s.; Column, 23.

Advertisements guaranteed to appear on the front pege are charged at the rate of 1s. per line, head line counting as two lines. No display is allowed.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Adver-tisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS .- To Advertisers, Subscribers, and Others .- It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. COVE, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, Including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. Cove.

Subscribers who experience any difficulty in cbtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint.)

Gardeners' Chronicle.

SATURDAY, DECEMBER 5, 1896,

CASTLEWELLAY.

YEW country seats in these islands are so delightfully situated as Castlewellan, the residence of the Earl of Annesley, in the county of Down. The estate lies about 4 miles from Newcastle, a rising watering-place, which nestles at the foot of the Mourne Mountains, just where they dip into the Irish Sea, and it is close to the market town of Castlewellan. On nearly all sides the home estate is surrounded by Mourne Mountains, whose outline, as is usual with those consisting of granite, is rugged and broken. Slieve Donard, the highest peak, 3790 feet, is fully in view. The locality is probably of easiest access by railway from Belfast to Newcastle, but the traveller from the south would do well to leave the main Dublin-Belfast line at Scarva Junction, and take the branch line to Ballyroney, whence a "longcar." holding six persons on each side, will take him, if he so please, 9 miles further, by a road skirting the mountains most of the way. It is a short drive from the town to the Castle, partly by what is a public road, and the remainder of the distance through undulating park-land.

The residence (fig. 116', a modern castellated structure of blue granite, stands on a slight eminence at the extremity of a fine sheet of water, more than one mile in length, and is admirably placed for obtaining fine views of the landscape, which is varied to an uncommon degree.

Once inside the gardens under the guidance of Lord Annesley's head gardener, we were compelled to cease surveying the mountains, to admire the unequalled collection of rare trees and shrubs to be found on the lawus. The symmetry and fine growth of everything are remarkable, and in many cases unequalled. Remodelled, and in parts wholly laid out by Mr. Ryan under his Lordship's unremitting superintendence in the course of the last thirty years, the very large gardens abound in plants from Japan, New Zealand, Australia, Mexico. Peru, California, and Chili, introduced during the last half-century, which have been planted to the exclusion of commoner ones, whenever their hardiness in the mild climate of the district had been ascertained. Hence the splendid Senecios, Pittosporums, Podocarpus, Bambusa, Eucryphia, Lomatia, Osmanthus, Daphuiphyllum, Larix Kampfen, Aciphylla squarrosa, Japaneso Acers, Eriobotiya, Eucalyptus, &c.

The natural contour of the lawns on which many of the arboreal treasures of the place are planted, enables the beholder who chooses his points of view with judgment to inspect the

at return for such in fact it is, as a whole, the gr und gently falling to the south, with might or und to the else, and a terrace to the

Taking shrais first Mr. Rvin, his lordship's gardener, directed on attention to a perfect specimen of Pittospor in. May, the native country of which is not known of thel to the ground with foliage, aut to some 1 feet in height and diameter. As the recepted y perfect in its outline, was 15 feet high left of feet through. Other species remarked were P man phyllinn variegitum and P, eugenioides viving to the most desirable shribs . P. crassifolium, the last reper as a surfle in recyclibe of withstanding of treenth others; Poriblema, and P. Colensoi, with all organizations braves, the most distinct-booking Prey these has neat-habited and graceful od a Charly from the southern hemisphere, are to a that's a this country-xiepting in the most favoured lead to the lead to a the 'train and the southwest countries of s Mari orl England. A small bash of Energphia conditions on bloom, this and E. purpur ware organization, puts his lyst this levelling. It must be odd ago plants which are usually regarded as rva ryjimis, do well here; a specimen esty L. plumité du 5 feet high has stool It severally one and has foliage of a healthy dark green olog. Osmonthus Aprifolium and O. myrithat's a by I sport of the former, grow into handsome bushes. O organies-variegata O, aure evariegets, probably forms of O. Aprifoloum, as well as O. r doist? La are all to be found here, as shrubs of low ar with, with glistening dark green foliage. phyllom gludescens, an evergiven shrub of with the much cannot be suit in its fare ir, was recorded in several time examples, one being a pertestly is full basis wheet in diameter, and a varies gitel form of this species introlled this year from jun is a very distrible form. Some of the Some is an abrula with a good ded of character in their foliage and flower, and are scarcely to be I sed as calluging to an order which includes Tuta n Granulal S. Festin Fig. 121, p. 603 the everation species, with hold, handsome, deeply served haves. S. compactum has pretty znay zresu le se, which are edged with white, and S. Greyer has grey coloured foliage, a pretty menst to other leaf-times. Hymenauther crassithe against the many whose, berry like fruits. The son voit tooler Nepulson Performs aristatic studs ersele & II. An excellent e equipplant sontable the vertex wolf or farmshaug a small bed, is splazandre charensis to collier resmitting has is justed and by producing its redemigrant flowers in the winter. The E rights form a genus represented by three species, v.c., b. edulis - multiflerar, E. maro-phyla, o.d.E. Il 1216 a and what we take to be a varsity of E. purgens, named E. aureo marginata. What these halt trees and log bushes are in fruit they tim postry closers in any garden. It is unfortunate that, with sigh hardy everywhere, they are seldom place le The beautiful Mexican Coolsya terrata is nesses harr by thost at Castlewellan, and it grows into Securifial cash when planted quite out in the open. A plant of Descontance spinosa was 10 feet high, as

handle eter, and flovers well every year. Of see I show he is one to be found. Plants of I had the compy 1 - u with A's will in order to flower them. A place that it keeped Aster argophyllus wisnoted, Times quantes, which at this place gets itsline growth a product frost. The Japanese Maples are, as the regist rangenes mever hurt by frost, as they are remain core in this country. We noted a point of Euscathus, apolical to of Rhaphitamnas sport are to the Holden are succeeded a lake of a life to The almost perpetual flower-2 Not an object to in excellent shrub, as Verbnicas ring are in the hall climite of Ireland. We - in the Caslevellin planthist that seven -sisting or lens. The species V. Anders not " Farmer, but V. decussati grow in a very for your or places it a very love size, and all of

of Veronica Traversii, twenty years planted, has a diameter of 18 feet, a height of 8 feet, and circumference of 25 yards 1 Veronica Hendersoni variegata, a nice plant, was full of bloom. One of the best autumnil-flowering St. John's Worts, is Hypericum oblong folium. The fine large-flowered H. Moseriaurum is included among the eight species existing in the guidens. A somewhat tender plant is Eurybia erubescens, but it suffers here only in severe winters

Viburnum interocephalum may not be classed among tender plants, for it is capable of withstanding the hardest frosts of this country, the heads of white bloss on exceel 6 inches in diameter. Clethri erhorea may be trusted out of doors although it is usually reckoned among the jumates of the greenhouse. Ce Irela sinensis is a tree of fine characteristics, which might be taken at first sight for Ailanthus glandulosus. Corynocarpus Levigatus is a fine evergreen shrub, of large growth, said to be quite hardy at Castlewillan. A specimen of Drimys Winteri has reached the rice height of 4 feet, and one of Eugenia apiculitus was in blossom (second week in August); the black stemmed and white-flowered Hydrangea mandschuries piets is a remarkable-looking shrub, which is doubtless of sufficient hardiness to figure in English gardens.

Vitis Coignetti, ibo it which so much unb served notice was made a few years ago, is found here, as elsewhere difficult of propagation; and a Vine in asuring 15 feet in width, is being about lantly layered. Whether Mr. Ryan will succeed in obtaining fresh plants by this method has yet to be proved. Many American Vines, and some others cultivated for their fruits in this country, have leaves more handsomely coloured in the autumn than this species, the colour is reld'sh purple. The so called evergreeu Laborrann, Piptanthus nepalensis, was remarked, Of Griselinias, the species known in gardens as G, luible has a much larger leaf than the betterknown G. httoralis. The unique example of a species of Banana hardy enough to exist out-of-doors in Ireland may be remarked in Musa Basjoo from Japan; whether it will be in fruit or exist for any length of time are matters which have yet to be proved. If it should her but not four, it would still be a gain to the subtropical gurdener; or it might be found to yield surviceable fibre. [] Several species of Fucallyptus may fairly be said to be hardy in Ireland, and an example of E corlata was noted, but which does not always escape uppry from frost. A specimen of E. urn gera eighteen years old, is 40 feet high, and pr portionately broad.

As will be readily understood, the species of Bimboos from Japan form haudsome clumps, and we noted Arundinaria riponica syn. B. Metake, B. tessellata or Razamorski, with foliage measuring 4 inches in width and 15 inches in length, as large, theretore as the of B. pilmata : also B striata aurea, of which a small example only was seen; and B spathiflora, with very striking foliage. It was a surprise to find Aralia popyrifora quite har ly in this part, and carrying time foliage. Ciethra paniculata was just coming into flower. A hands one pulm ite-leaved Hibiscus was remarked in H. heterophyllus, the beat hiving five segments or lobes. Edwardsias are not very certain doers, and Mr. Ryan said that E. microphylla and E. granliflora are apt to get nipped by frost when standing in the open borders. Of the x, of which there are several noble specimens, there were noted I insignis, a species remarkable for its fine foliage, I latifolia, according to Professor Surgent, the birst Japan species; I. cornuts, and several of the more common golden and silvery variegated forms of Hex. The rare New Zealand Forget-me-Not of relatively govantic proportions. My-ostidium nobile, is a hardy plant here, as are like wise Buddleias Lindleyana, Colvillei, and variabilis , et which latter a good example was noted. A fine bit of Khas Toxicodeudron occupies a place on a wall; Berberts Thunbergi is a very fine plant, covered with small globular fruits of a scarlet colour. An example of Ornus europæus measures 4) feet by 40 feet, and Spines opulifolis lutes, we were told. is a picture of beauty of colour in the spring. A

plant of Rhododendron Thompsoni, carried 150 trusses of bloom last January-a truly grand plant.

Before concluding our notes of the many beautiful shrubs growing in these gardens, we would pass in rapid review others that were noted in the course of our visit, viz., Stephanan Ira flexuosa, Glyptostrobus heterophyllus, 5 feet in height, resembling a Taxodium in leafage and habit, but with more grace; a plant of Prumuopitys elegans, 3 feet high; the well-known Philesia buxifolia, with tubular flowers of rosy-red colour: Mitraria enceinea, with similar flower, but smaller ; Meliosum pungens, also with tubular flowers of a scarlet hue; Lindera sericea, Olearia nitida, Philodendron amurense, Calceolaria violacea, Damnacanthus indicus, Nandina domestica, Entelea arborescens with cordate leaves, 9 inches across; Berberis Wallichima, B. nepalensis, B. Fremonti, which has blue-green foliage, and B. Neuberti . ; Metrosideros floribunda, and M. robusta, a nice evergreen shrub; Eugenia Ugni, a plant once thought to be of domestic value, but which has no v dropped out of cultivation; a Saltbush Halimedendron sibrieum, Enkianthus apponicus, Escallonia pterocladon, Leptospermum bullatum, Cercidophyllum japonicum, Decumiria barbara, Coprosma Baueri, Ekeagnus Frederici, a species with fine leaf variegation; Cornus florid; rubra. Mallotus japoniens, Lagerstræmia indica, Daphne Cheorum, Acanthopanix sps. deciduous; Nerium Ole inder, Magnolia hypolenca, Cinnamomum sericeum, and Castanopsis chrysophylla. Whilst the following new plants are under trial, viz. -Exochorda Alberti, Planera crenata, Abutilon vitifolium and A. vitifolium purpureum, Citrus trifoliata, Garrya Thureti and G. macrophylla, Hedysarum multijugum, Melicsma myriacantha, Seuceio rotundifolius, Stauntonia hexapetala, a rapil wallclimber; Nemopanthes canadensis, berries large and beautiful, of a crimson colour; Pittosporum r gidum, P. Ralphi, and P. Buchanani; Rhamnus californica and R. frangula asplenifolia, Itea virginica, Ribes chilensis, Callicarpa japonica, and Oreodaphne californica.

(To be continued).

FLORISTS' FLOWERS.

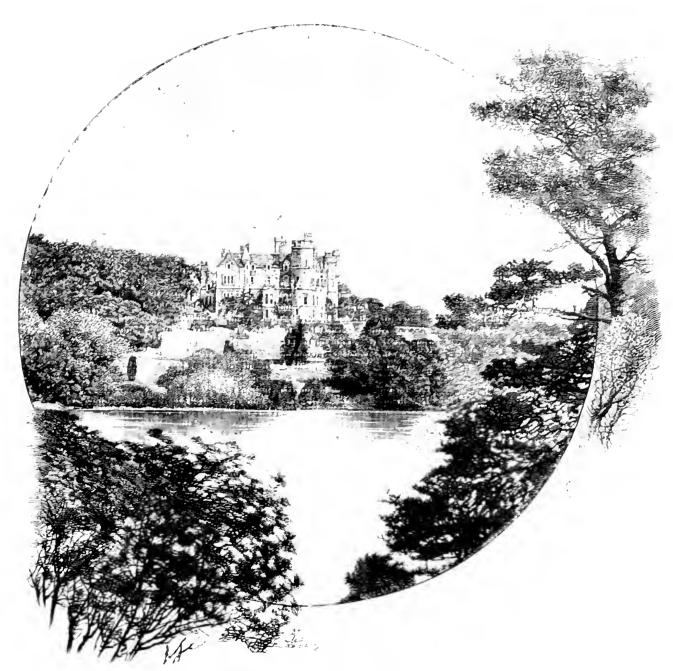

THE SHOW, OR LARGE-FLOWERED P.SLAR-GONIUM.

MR. HARRY TORNER assures me that the Show and Fancy Pelargoniums, once so popular, are in a declining state in the popular estimation, as shown by the decreasing demand for plants. That there is a decreasing demand for high-priced named varieties we have been assured for some time past; but it is difficult to believe that a subject so easily cultivated, so free and plenteous in blooming, and so attractive for several months of the year, is on the downward plane. And yet thousands of plants are grown for market, and it should be borne in mind the market trade-at least as far as its present gigantic proportions are concerned-is of comparatively modern development, and by its means the Pelargonium finds its way to numbers of cultivators, who would otherwise have to depend upon the ordinary nurseryman. Then also the old show Pelargonium-the delight of the old school of florists of forty years ago - with its perfect shape and high colour, has had to give place to a large extent to the vigorous-growing, free-flowering, decorative types, and quality of bloom is not now nearly so much considered an abundance of it; though among some of the more modern varieties, and especially to those raised by Hayes, Jones, and others, there is a gradual development in the decorative varieties of that perfection in form reached in the older section by Hoyle, Foster, and others.

There is this advantage about the larger-flowered

glass, where the shoots soon put forth growths. Then it is shaken from the soil, the roots trimmed, re-potted into a smaller pot, fresh soil of a suitable nature being employed, and it is again placed under glass. Kept close for a few days root-action soon becomes active, and when the pots are fairly well filled with roots, another shift into a larger-sized pot is made, which is generally the one in which the plant blooms. The second shift should be given in the second week in October. In the

Amethyst, rich purple, with dark tot petals. Blue Beard, light purple, shaded dark upper petals, and a conspicuous white throat, quite distinct in colour: Candidate, one of Mr. Foster's newest introductions, rosy-purple, with a paler tint on the edges of the lower petals, dark spot on the top petals, and conspicuous white throat, extra fine; Chief Secretary, respectimeson, shaded with maroon and orange, white throat; Curtius, new, maroon top petals, shading to bright crimson, dark crimson lower petals, white

FIR 116.- VIEW OF CASTLEWELLAN AND L AR. SEF P. 6-

Pelargonium, that it is evergreen, and its bright green foliage is pleasant to the eye at mid-winter, and the scented leaves—though this quality is not so strongly present as it is in the case of some of the species—always give forth a grateful perfume. When a specimen plant has gone out of flower, it is generally placed in the open—if possible in some partially shaded spot, to ripen its wood. When this is perfected, it is cut back somewhat hard, leaving only a frame-work of naked branches; the cut shoots are made into cuttings, which soon form young green plants, while the cut-back specimens are put under

old days, when three exhibitions were held at the Regent's Park, one in May, one in June, and one in July, Pelargoniums were shown at each; and then different treatment as to cutting down and respotting was required in the case of plants shown in May and those two months after. Pelargonium exhibitions are now almost a thing of the past, though fine collections appear at the Temple exhibition.

At the Royal Nursery, Slough, and other places, the show Pelargonium is still grown. A selection of eighteen of the finest varieties should include throat a nine and rich variety; Duke if Norfilk, deep irims mescarlet, with dark toper-tails. Exquisite, deep orange-scarlet, with dark top petals—extrained Fortifield, orange upper petals, with black spot, the lower petals pink, shading to rise: Maid of Hobour, dark top petals, margined with flery orange, the lower petals pink, shading to rose—one of the finest: Martial, rich deep orangon, with dark top petals—very striking. Magnate, thick top petals, shading to fiery orimson, one-picuous white throat—extrained: Mrs. Combs pure white with carmine spots on the upper petals—extra fine: Outlaw, pale orimson,

with dark top petals, compact habit: Resolute, one of the finest, deep rose lower petals, dark maroon top petals, large pure white throat, flowers of fine quality: Royal Review, the lower petals richly painted with crimson, dark top petals—very fine: Statesman, pale rose lower petals, with dwarf top petals—a large, bold variety: and The Czar, a brilliant deep crimson Pelargonium, flowers of great substance and quality.

At this time of the year all the plants should occupy the stage of a light and airy house, and young struck cutting plants should by this time be making nice bushy specimens, having been potted on. In order to make these young plants bushy, the centre shoet should be pinched out as seen as the young plants are well established after their last shift; this causes them to put forth shoots near the base, and so lay the foundation of what is technically known as a good bottom. Such plants may presently need a further shift, and a good compost will be found in one made up of good turfy loam, well-decayed manure, and silver-sand, good drainage being provided. Careful watering is required, and when the weather is cold, the house in which the plants are, should be shut up early. As soon as the autumn fogs come on in the cold, damp weather, a little fireheat may be given with advantage, but on no account sufficient to cause the plants to become drawn. Green-fly must also be closely looked after and destroyed. R. D.

ORCHID NOTES AND GLEANINGS.

A TRIANDROUS CYPRIPEDIUM.

MR. LATHAM sends us from the Birmingham Botanic Garden a flower of a Cypripedium raised in that establishment out of C. Spicerianum by C. hirsutissimum. In the flower in question the lip is nearly flat, but marked with a few purplish vertical streaks, the column bears three vielet-coloured staminodes corresponding to A 1, a 2, a 3.

SEMI-DOUBLE CYPRIPEDIUM.

Mr. Linden sends from Brussels aflower of Cypripedium Dauthieri, or one of its derivatives, with four distinct sepals, two petals, one lip, and a column with three staminodes, A 1, α 2, α 3. The axis of the flower is a little twisted, so that whilst the uppermost sepal or standard bends to the right, as the flower lies before us, the lip turns to the left.

PELORIATE CYPRIPEDIUM.

Mr. Linden also sends us a flower of C. venustum (!), in which the two lateral petals have assumed the form of lips, so that there are three lips to the flower. Otherwise the conditions are normal. $M.\ T.\ M.$

What Constitutes a "Crispum?"

In the Gardeners' Chronicle issue for November 21, Mr. Crawshay asks what constitutes a "crispum? Odontoglossum crispum, I suppose, he means; and the Editor closes by asking what were the characteristics of the plant first introduced. Not having Lindley's works to refer to, I must refer to Bateman's Monograph, in which he calls the white variety "Weir's" and the spotted forms "Blunt's," and also gives a fullsize plate of a plant with two spikes, and a detailed sketch of the lip, which clearly shows the construction of that organ, i.e., the column side-wings on to the disk or plates in the throat, and two teeth with a central raised prominence between them. Messrs. Veitch in their Manual of Orchulaccous Plants, say flowers polymorphons, 2½ to 3½ inches in diameter, in colour generally white, or white tinged with resymauve, occasionally pale yellow, sometimes more or less spotted and blotched with red, but always with the disk of lip bright yellow, lip oblong or subpanduriform, with the edge jagged or toothed; sometimes rotund at the apex, sometimes two-lobed, and not unfrequently acute, or even apiculate, crest expanded into two yellow lobes barred with red, and terminating in two diverging teeth, column slightly arching with two broad jagged wings. Williams, in his Manual of Orchids, gives pretty much the same description, calling it a charm-

ing addition to our collections, and one which affords many varieties, ranging from pure white to yellow and rose, and including various spotted forms. After the above description of O. erispum from recognised authorities, there should not be much difficulty in deciding what is a pure "erispum;" but Mr. Crawshay in his note seems to imply that only pure white or rosy forms are true "erispums." If we accept his theory, we shall have a difficulty in classing the yellow and spetted forms. I cannot help thinking, that as long as a flower has the characteristics of O, erispum as laid down by experts, we must accept it, netwithstanding the variation in colour. I am afraid one of the "discussants" will not agree to settling it in this way, and he would have helped to clear the air f he had given his own definition first, as it will be a difficult matter to persuade growers of Odontoglessums that such varieties as crispum, Stevensii, Chestertoni, apiatum, Cooksoni, and the thousand and one fine varieties and crosses. also the yellow ones, that now and then crop up, are net crisoums; and if they are hybrids, they run so near to O. erispum as to be indistinguishable from it in form.

I have already exceeded reasonable limits in this note, still I hope some more capable person than myself will continue the discussion. I send a photograph of the flower in question—O. crispum Golden Queen; and one more, which is an undoubted hybrid, also a pure white O. crispum. W. S.

THE ROSARY.

ROSE NOTES.

November 23. - I have still a few blooms upon plants in the open of Madame Hoste, Caroline Testout, and Marchioness of Lorne-being among the best. Madame Lambard, Safrano, Dr. Krell, and Souvenir d'un Ami are also quite presentable. In the Rev. Dr. Williamson's interesting notes on p. 624, he is surely in error as regards Fiametta Nabonnand. This was net a sport from Papa Gontier, but the result of crossing that variety and Niphetos. The size, colour, and form confirm this. I do not find the blooms so oval as Dr. Williamson describes; in fact, the buds are fully as long as those of Papa Gontier, and this is one of its chief charms as a coat flower. There is a great future before Fiametta Nabonnand, and it will assuredly be much grown in the Rose garden for pleasure, and as an early forcing Rose under glass. I do not think it will ever become an exhibition Rose, except in the classes for garden Roses. The best substitute for Maréchal Niel is climbing l'erle des Jardins, but we cannot get the intenso colour, grand size, and form of the Maréchal yet. Climbing Perle des Jardins is as constant a bloomer if unpruned as the normal variety, and earries peculiarly handsome bronzy foliage.

A LITTLE-KNOWN ROSE.

11.P. Due d'Orleans, although sent ont by so reliable a raiser as E. Verdier, as long ago as 1889, is very little known. It is one of the very best-shaped Roses grown. The supplement of the National Rose Society's Catalogue describes it as "a deeper-coloured Marie Baumann and a better grower." This is about the highest praise pessible, but it is not by any means overdone. Very few trade catalogues contain it. This is by no means the only extra good Rose that has been overlooked by the majority of growers, and I mention it now hoping to be in time for many to make good the omission. A. P.

METHODS OF PLANT PROPA-GATION.

(Continued from p. 658.)

Ferns.—None of the methods already mentioned would adequately supply the demand for small Ferns for table and apartment decoration, now so much the fashion, so that the florist has to fall back on the spores.

Let us briefly state the process of Fern-reproduc-

tion from the spore, which may be studied by anyone possessing a microscope of low power, or even with a good single lens, as a Coddington or Stanhope, the whole process being intensely interesting.

When the dust-like speres are sown on moist earth or, for more facile observation, on fine silver-sandor, perhaps, handier, on thick white blotting-paper, kept constantly moist by the application of tepid water, they soon begin to germinate, especially if taken fresh from a frond. The minute brown cellwall bursts open, and from the rent so formed issues a transparent process, like a minute root or radiele; this increases in size, and soon a plate-like expansion is seen, resembling a minute cordate leaf, which is termed the prothallus which under a low power of the microscope appears like a small Liverwort (Marchontia). Up to this point there is not much difference observed from the germination; but now the parallel ceases, for on the lower snrface of this prothallus are formed numerous minute globular cells, or antheridia, and these, when mature, being detached and placed in a drop of lukewarm water, on a glassslide under the microscope, are seen to burst open and emit numerous exceedingly minute spiral filaments, or spermatozoids, which move rapidly about, when freed, in the drop of water, by means of eyelash-like fins (if I may use the word) called "cilia." These singular bodies play the part of pollen-grains in the higher plants.

Somewhat later other cells, a little larger and more complex in structure, are found just at the angle of the heart-like prothallus, and close by where the little rootlets of the frond-germ are found. These are the "pistillidia" or "archegonia," bodies analogous to the pistil and ovary of flowering plants, and like them, centaining the germinal cellule or vesicle. These, through the agency of water, dew, or moisture, are fertilised by the metive spermatezoids, which, being exceedingly minute, are capable of swimming in a mere film of water, and afterwards slowly develop into a minute plant, producing a terminal bud, out of which in the next process grows the tiny first frond. Then the prothallus dries up, and presently more fronds are produced; but it is some time ere these bear any fixed likeness to the parent Fern. During this process, too, the little roots are fixed firmly in the ground, and the Fernlet is on its way to grow into a perfect specimeo, and again reproduce its kind.

Not many, as far as I am aware, except Mr. Lowe and a few others, have up to this date endeavoured systematically to hybridise Ferns, but on the lines I have imperfeetly sketched above, it can doubtless be done, and I have little hesitation in saying that all the singular and interesting varieties in the Lady Fern (Athyrium), in the Buttonhole Fern (Scolopeadrium), with which the late lamented Mr. Sim, of Foot's Cray, made such a long catalogue of, resulted from cross fertilisation during the complicated germination of the spore.

I suggest, therefore, that to those who have the opportunity and time at their disposal, the sowing of mixed spores of allied genera under the same bell-glass, and keeping a record of the varieties used, and of the ultimate result, thus adding a few facts to our very limited knowledge of Ferns in their early stages of existence and growth.

In propagating Ferns from spores, we must make practical use and application of this knowledge, and find in the minute spores such an environment that their wonderful and complex method of reproduction may be easy, and not hindered by improper conditions in any way.

First, therefore, prepare your pots or pans, which should be new ones, as old earthen vessols used for garden purposes almost always have the dormant spores of mosses or Liverworts enerusted on their surface, only waiting for favourable conditions to germinate. Half fill the pan with small crocks, place on them a small quantity of mixed soil, and finish with fine sand, which, as well as the soil, must be sterilised—that is, heated to such a temperature in the oven or stoke-hole fire, that all existing spores of moss or Liverworts may be destroyed. Press the sand and soil down firmly, and water all over with a fine-rose pot using water that has been steri-

lised by boiling. Allow the water to soak well into the sand, and then with care sow the Fern-spores evenly over the surface, and cover with a piece of clean glass resting on the rim of the pan or pot, or a bell-glass may be used that just fits within the rim resting on the soil. Plunge the pan in cocoa-refuse in an inside pit, where the temperature is low and even. Never let the soil get dry, but do not water

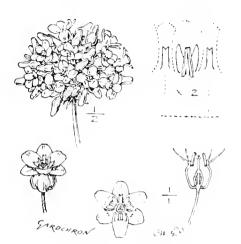

Fig. 117.—Stropholision californicom (broble) volubilis): Flowers crimson.

the surface, but immerse the pan up to the level of the soil in boiled water at about 70, by which means the young sporelings will not be disturbed, and the essential degree of moisture will be maintained.

SELAGINELLAS.

The propagation of the plants known as Selaginellas and Lycopodiums, which are not so useful or so well known as Ferns, but which in some kinds are almost indispensable for associating

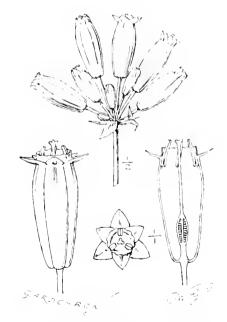

Fig. 118. - BREVOORTIA IDA-MAIA (BRODLEA COCCINEA); FLOWERS CRIMSON.

with flowers. Mr. B. S. Williams, and other growers, catalogne over fifty varieties and subvarieties, many of which require but a greenhouse temperature, accompanied by shade, to cultivate them successfully. Most of the species propagate themselves freely under favourable conditions, producing quantities of adventitions roots along the wiry creeping stems, which then only require to be divided into short lengths, potting these in light peaty soil and

keeping them close in a shady part of the stove, or under bell-glasses, to soon make good useful plants. They may also be raised from their spores in the same way as directed for Ferns, the spores not being produced like the latter, at the back of the fronds, but in little spikelets of brownish scaly leaves terminating the branchlets. These had better be cut off and allowed to drop into a clean dry pan or on to a sheet of white paper, and placed on a dry shelf for a day or two, when the very minute spores will be scattered around. The spores may now be sown into moist, sterilized sand under a bell-glass, kept moderately moist and warm, and they will soon germinate and give an ample supply of plants. The most useful kinds to gr.w are Selaginella africana, S. cesia and its variety S. c. arborea, S. denticulata and its golden sport S. d. Kraussiana, S. Mertensii, and its pretty variegated form, with S. stelonifera, and some of the minute forms such as S. apoda or caulescens, Browni, &c., which, unless you aim at a complete collection, will be found ample for all ordinary purposes.

Before concluding let me suggest that the practice of allowing mosses to grow and cover the soil of Ferns and foliage plants, though agreeable to those who do not like to see a patch of bare soil, is not by any means conclucive to the health of the plant occupying the pot, inducing a state of things in the soil which, for want of a better word. I will call by its well-known appellation "sourness," always banefol, and if continued, likely to be fatal to the plants. Experience.

(To be continued)

THE GENUS BRODLEA AND ITS ALLIES.

(Concluded from p. 159.)

In the Genera Plantarum the following plants, nearly allied to Brodinea, are kept up as distinct genera.

Milla biflora, Cav., has four to six filiform leaves, one to six flowers on long rigid pedicels, a subcylindrical perianth-tube, with six anthers nearly sessile at its throat, white or purplish perianth-segments 1 inch long, with a distinct brown keel, and a shortly stipitate ovary. It inhabits the mountains of Mexico, ascending to 5000 feet above sea-level, and has been found also in New Mexico and Southern Arizona. It is figured in the Betanic Register, t. 1555, and in Flore des Serres, t. 1459.

Stropholirion californicum, Torrey Brodian volubiles, Baker), is figured Bot. Mag., t. 6123 (see fig. 117). It has a climbing stem that sometimes reaches a length of 8 to 10 feet, an umbel of fifteen to twenty flowers, with short pedicels, a bright red perianth ½-inch long, with oblong segments as long as the ventricose tabe, three emarginate strap-shaped staminodia, three broadly-winged antheriferous stamens, and an acutely-angled oblong capsule 1½ inch long. It inhabits the foot-hills on both sides of the Sacramento valley, with a range from north to south of 100 miles.

Brevoortia Ida-maia, Wood (Brevoortia corcinea, S. Wats.; Brodiva corcinea, A. Gray), has narrowly linear evanescent leaves, an erect fragile peduncle 2 to 3 feet long, four to twelve flowers in a lax umbel, a bright red perianth 1 to 1½ inch long, with an oblong tube, saccate at the base, short ovate yellowish-green spreading segments, three fertile stamens, inserted inside a short faucial corona. This also is a native of California, and is figured Bot. Mag., t. 5857 (see fig. 118). It inhabits rich soil on the monntains from Humboldt to Shasta counties.

Behria tenuifiora, Greene. I have not seen this either in a living or dried state. It is described in the second volume of the Bulletin of the Californian Arademy, p. 143, from fragmentary dried specimens in the herbarium of the Academy, collected in the neighbourhood of Cape St. Lucas. It has eight to ten flowers, on slender pedicels 1 te 2 inches long, a periauth under 1 inch long, with a globose tube, six-saccate above the attenuated base, thence more gradually contracted into a long narrow tube, with very short ovate-oblong teeth, and six perfect

stamens, with filiform filaments free down to the ball of the perianth. The ovary is stalked, and the cells many ovuled. It was named by Dr. Greene after Dr. Herman Behr, Professor of Botany in the College of Pharmacy of the University of California.

Bloomeria differs from all the other plants dealt with in this paper by having the perianth-segments

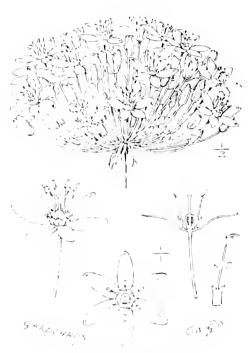

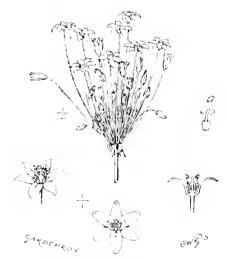

Fig. 119.—BLOOMERIA AUREA (BRODLEA AUREA); FLOWERS YELLOW,

free down to the base, as in Allium and Nothos cordum. There are two species, **B. aurea**, Kellogg (Nothoscordum auream, Hook, fil., in Bot. Mag. t. 5896 (fig. 119); Allium croccum, Torrey), with a dense umbel of bright yellow flowers, with oblong segments spreading from the base, and hypogynous stamens nearly as long as the perianth, with

Fug. 120.-Bloomeria clevelandi.

filaments suddenly dilated in a square process at the base; and **B. Clevelandi**, S. Watson (fig. 120), with the same structure, but the scape more slender, the flowers (also bright yellow keeled with brown) smaller, and the stamens shorter in the proportion to the perianth. Both these are natives of California, and fine plants for horticultural purposes; B. Clevelandi has not been previously figured. J. G. Baker.

FRANCE.

LILLE.

For the last three years, since the retirement of M. Jadoul, the various town and suburban public gardens have been under the management of the Travanx municipaux. These spaces include the Botanic Garden, the Ecole d'Arboriculture, Jardin Vanban, various squares, the Deule woods, and certain other promenades. The Botanic Garden was formerly in the town, but about eighteen years ago it was moved to the suburb St. Maurice, a rather ont-of-the-way spot, and near the large cemetery. The area of the garden is nearly 10 acres. On the occasion of my recent visit, many plants were in the open air. I remarked a fine series of Cycads, including Stangeria paradexa and Bowenia serrulata, rather rare plants; Burbidgea nitida, with orange-red flowers clustering at the top of the stem ip graceful bunches; and Calamus ciliaris, a pretty Palm resembling Cocos Wedelliana in the lightness of its delicately cut fronds. In a small hothouse hang Platyccrium, some pretty Bromeliads of the Anoplophytum and Tillandsia type, grown on blocks of wood, and including the rare and curious T. usucoides, its slender stems winding round a branch.

In the same house were Anoetochilus, including Rellissoni, with fine branches; Coces nucifera, a nnt sprouting and putting out its first leaves; numerons Aroids, such as Alocasia, Cyrtosperma, Aglaonema, Curmeria, and others, forming a fine group, and completing a collection of Dichorisandra, among which are the pretty D. musaica, Bertolonias, and Sonerilas.

I also noted two Nephthytis in the houses; N. picturata, valued for its fine truss of leaves; and N. Eberica, less fine in foliage, but corious for the clusters of large orange fruits which it always bears. In another house my attention was drawn to Ferns, and Lycopods, the former, very numerous, included some interesting specimens, among others Marrattias, Hymenophyllum, Actiniopteris radiata, somewhat resembling Latania minuscula; Rhipidopteris peltata and gracillina, as well as Gymnogramma lanata, remarkable for its woolly, flexible petioles.

Lycopods were in fine variety, including fifty-four recently-received Selaginellas, among them Lycopodium pinnifolium, fine plants; and Psilotum triquetrum from New Holland. This plant should be known outside botanic gardens as a plante d'appartement. Among carnivorous plants, I saw twenty-five varieties of Nepenthes, among them many specimens of the always rare N. Veitchi, Cephalotus, Dionea, several curious broscera, such as D. binata capensis, various Sarracenia and Drosophyllum lusit micum.

The entrance to a hot-house was decorated with Pothos celatocaulis, an Aroid remarkable for its imbicated leaves; Marcgravia dubia, and Ficus barbata; plants with somewhat similar foliage, and growing round the door-posts; also, there were various Gloriosa, among them G. superba with curiously undulated flowers; also Vanilla and several species of Ceropegia. There was a fine collection of Dioscorea, including D. Anœctochilus, argyrea, chrysophylla, melanoleuca, discolor, illustrata, sinnata, pentaphylla, and numerous others, one of which, yet unnamed, bears large blackish bulbs in the axils of the leaves.

I noted also as interesting plants, the Baobab (Adansonia digitata), Antiaris toxicaria, Guetum Guemon, Theobrama Cacao, Bombax Ceiba, Dillenia aurea, pentogyna, speciosa, forming trees of rare beauty, and a fine collection of Piperaceie.

In the open air, near the houses, greenhouse plants were arranged in beds, among them Australian and South African plants, including the curious Testudinaria elephantipes, with its remarkable stem. Not far from this is a Conifer group—Araucaria, Athrotaxis, Dammara, Podocarpus, Fitzroya, Torreya, and Frenela. The greater part of the ground occupied by the École de Botanique is bisected by a central walk, along which are, at intervals, tanks for the cultivation of aquatic plants. Here are found her-

baceous plants only, the trees being grouped about on the lawns of the pleasure-grounds. Thus, specimens interesting to the public are grouped together in one place. In front of the school are borders, filled yearly with decerative plants suitable for growing in gardens in northerly regions; one specimen of each species or variety is included, and there are climbing plants, those with ornamental leaves and flowers, suitable for greenbonses and the open air.

The fine garden of the *École d'Arboriculture* is situated at the end of the *Jardin Vauban*, and has an area of about an acre. There is here a collection of fruit trees, Apples, Pears, Plums, &c., grown in pots, and fruiting well. The Municipal Administration of Lille has instituted free public courses of instruction on fruit culture, which take place in this garden, and are regularly attended. The courses include eighteen lessons on the management of a fruit-garden, grafting, cutting, and the cultivation of various fruits.

Jardin Vauban.—This is the largest garden in Lille, having an area of 17½ acres. It was laid ont on the plans of the well-known landscape gardener Parrillet Deschamps, and is very fine, including all features likely to render it popular. It is well kept up, and the bedding is a preminent decorative attraction. Among the pretty combinations of bedding plants, I admired a mixture of Nicotiana colossea fol. var. and Calceolaria Gloire de Versailles upon a carpet of Irosine acuminata; this was bordered with three rows of plants; Begonia versaillensis, B. fulgens, Centaurea candidissima, and zonal Pelargonium M. Poirier, on a background of blue Lobelia erinus.

Another bed contained tuberous Begonias with Chrysanthemum-like, salmony-rose flowers, rising from a mass of dwarf B. multiflora Petit Henri, a very floriferous variety, with little double brick-red flowers; the border was a double band of yellow Alternanthera, relieved here and there with Begonia Bruanti pygman and blue Lobelia (Fair Maid of Moray).

Another successful mixture was of Abutilon Sawitzi, plants two years old, with Pelargonium Harry Hicover, and a border of blue and rose Ageratum and Begonia on a background of Abutilon megapotamicum fol. var.

In other beds I saw Cannas, greenhouse plants, and many Begonias, including the varieties Madame Ernest Tourtel, Octaire Mallet, Gloire d'Austerlitz, and Madame Courtois. On the lawns were several plants of Sciadophyllum pulchrum; splendid Aralias, with large digitate shining leaves; Solanums and Dahlias. Near the river are fine clumps of Cyperus, Papyrus and Polygonum tomentosum, a new species, with white foliage. On a slope by the shrubberies are tropical plants, such as Musa Ensete, Palms, &c.

The other squares, de Jussieu, Ruault, de Jena, du Palais des Beaux Arts, and du Palais Rameau, are also well kept, but with less choice plants. The best specimens are to be found in the Jardin Vaubau, whence, after two seasons' growth, they are passed into the other gardens. Credit for the excellent condition and management of the various open spaces in Lille is largely due to M. St. Leger, himself a pupil of the Versailles Ecole d'Horticulture. Ch. de Bosschire.

VIOLET PRINCESS OF WALES,

This Violet has already received the praise due to it as a novelty of sterling merit, and it cannot be disputed that its large well-formed flowers and long flower-stalks enhance its value, but compared to other varieties (exempting V. Princess Beatrice), it is a shy bloomer. It is purely an amateur's flower, and not adapted for market purposes. It has been thoroughly tested here in the Riviera, and I know that at Hyères, where Violets are grown in large quantities for market purposes, that most of the growers are already dispensing with it as being unprofitable.

When it first came into the market, it naturally fetched a good price, but I afterwards saw it sold at 2d, and 3d, for a large bunch; and, considering that the older varieties sell at 1d, or 2d, per bunch, it is evident that the freer-flowering varieties are selected. The new variety California, if answering to the

description given of it, will certainly be sought after. I have a few plants this season, and it bids well to be a very free-flowering variety.

CHRYSANTHEMUMS AT VILLA VICTORIA, GRASSE.

The culture of the Chrysanthemum in the Riviera has been quite neglected until the last three or four years, and there is little possibility of their becoming popular here, as they flower too early for the majority of proprietors, who do not arrive before the month of December: but nevertheless, what has been done is good proof that they may be grown as well, or probably better, than in the north. The greater amount of sunshine which we get is favourable to the ripening of the wood, and during the rainless summer they can be fed with stimulants with much less risk than in the raioy climates.

The Chrysanthemums grown at Villa Victoria are cultivated specially for specimen blooms, and it is not too much to say that they would vie with any that are seen at exhibitions in England. They were at their best at the time of my visit, and it may be interesting to note some of the leading varieties. Varieties with the reverse colouring of silver and gold on the petals have been chiefly selected, and when grouped together, they produce a very pleasing effect.

Many of Calvat's varieties were conspicuous, the greater number of which were remarkable for their dwarfness. Three or four plants of Le Colosse Grenoblois were carrying enormous flowers. President Armand was very fine, Madame Carnot measuring over 12 inches, Chenon de Leché, Directeur Tisserand, Reine d'Angleterre, Surprise, Jules Chrétien, L'Echevelée, Madame Calvat, and Enfant de Provence, all very fine.

Amongst those of other raisers might be noted:—Phoebus, Col. W. B. Smith, Viviand Morel, Edwin Melyneux. Chrysanthemiste Delaux, very fine; Hairy Wonder, Mrs. A. Blanc, Mrs. Isaac C. Price, and many others worthy of mention.

All the plants were furnished with luxuriant foliage down to the pots, and showed every sign of high class culture. Riviera.

PHYTOLACCA DECANDRA IN THE RIVIERA.

Although a native of Virginia, this plant has thoroughly naturalised itself in some parts of the Riviera, and at Grasse it is quite a common weed, but a very showy one, and it has more than once occurred to me that it would make a very effective potplant, or it might also be used with effect in the subtropical garden. It is easily raised from seed, and is a very rapid grower, resembling in habit the Daturas. The long racemose inflorescences, which are produced in quantity, are succeeded in the autumn by bunches of dark purple berries, which are even more effective than the flowers. The berries contain a crimson juice, and it is probably for that reason it is sometimes called the "Red lnk l'lant." The leaves also change their colour from a red to purple in the autumn, which further enhances its value as a decorative plant. Riviera,

ORCHIDS AT SUNNINGDALE PARK.

The gardens of Major Joicey's fine estate at Sunningdale are noted for the excellent culture of both flowers and fruits, and his clever gardener, Mr. Fred. J. Thorne, is an adept at keeping up the large supply needed at all seasons of the year. Certainly there is a very fine air for gardening at Sunningdale, as the ever-present odour of the Fir trees and Pines with which the neighbourhood abounds, plainly indicates, although the height of summer on that light, heathy soil must be rather trying to growing crops. Still, the number of subjects here thriving admirably, which many in similarly heathy situations cannot succeed in growing, give the highest testimonial for skill which a gardener could desire.

The Orchid houses are well filled with plants, and among them we noticed about one dozen meritorious examples of Diacrium (Epidendrum) bicornutum, a plant which scarcely any grower induces to assume

even a tolerable degree of health before its decline, but which here, in a warm-house, have increased in vigour and beauty for several years, and borne a profusion of flowers. The plants are pleasant objects even when not in flower, their large, fleshy growths and bright green leaves indicating perfect healthiness. One of the specimens was carrying thirteen growths, most of which will flower. Alongside of these were other difficult subjects, also West Indian, viz., the beautiful carmine-crimson Broughtonia sanguinea, this being likewise in splendid health, and well furnished with flowers. Two other examples of remarkably good culture of species which are notorious bad doers are Dendrobium atro-violaceum, of which one of the earliest plants introduced by Messrs, Veitch is here, and steadily increasing in size, flowering profusely and regularly; and a number of the similar-habited D. Johnsoniae. some of which bear spikes of ten or eloven large snow-white flowers. These plants, Mr. Thorne believes, grow more vigorously here than in places where they are kept in a higher temperature, the house in which they are growing being generally helow 55° Fahr, at night. Another superb example of good culture is the stage of Miltonia vexillaria. one of which was illustrated in the Gardeners' Chronicle, Dec. 21, 1895, p. 743, bearing thirty-niue spikes, cach averaging seven flowers. Among the batch is a remarkable variety, which, as soon as it has flowered, re-commences to flower. It is now in bud, and it is stated that it has been either in flower or in hud continuou-ly for three years.

The Brazilian Miltonias here thrive remarkably; the beautiful Miltonia × Joiceyana has just flowered, and many of M. Clowesii, M. candida grandiflora, one or two M. spectabilis, and the remarkable M. Russeliana, a very old but still rare species, were still in bloom.

A full collection of Orchids is not attempted here, but a number of showy species, together with some of the rare species which require skilful management, are got together, and as one and all are well grown, it will be profitable to give Mr. Thorne's opinion as to some of the points which are supposed to bring about these results. In the first place he is careful about the temperature, and especially about the houses having a temperature much lower at night than in the day-time; secondly, no houses are assigned to different classes of plants, but each is moved about from time to time to whichever house it may be supposed to do best in, although the larger classes occupy certain of the houses for a considerable period each year. Lastly, the plants known to be difficult to grow, are mostly suspended in the houses having an intermediate temperature, and in which quite half or twothirds of the staging of the houses is occupied by flowering and foliage-plants in pots, and this last condition is thought to be of very great importance.

Entering the first range we found in the end compartment a fine lot of Dendrobiums, with D. lutcolum looking the picture of health -a not very common incident with that species; D. Dalhousieanum, with growths, some of which were 5 feet in length; D. albo-sanguincum, a grand mass, with many growths; and many other species, among which are some fine D. nobile, which Major Joicey's son himself collected. Large numbers of Calanthes, some beginning to flower, were remarked as filling a high shelf, and on one side was a lot of fine plants of Cypripedium some good Leeanum, C. Chamber-C. Charlesworthii, C. lainianum, C. Spicerianum, C. callosum, C. Lawrenceanum, and some hybrids raised on the place, being in bloom, for here also is a great number of hybrids of different genera in various stages of growth. Along the centre runs a fine Nepenthes hybrida, with many pitchers; and in the adjoining division the Cattleya labiata, C. aurea, Miltonia Roezlii, Epidendrum dichromum, &c., were making a fine display. At the other end was a fine batch of Miltonia vexillaria, to which we have previously made allusion; and in flower some plants of Cattleya elongata, some more Cypripediums, and specimens of Pleione lagenaria, the stage on one side being filled with dwarf Poinsettias.

In another house some Cymbidiums were showing flower-spikes most profusely, and some of the C. Lowianum and C. giganteum were in bloom. So well do the C. eburneum and C. Mastersianum thrive here, that even single pieces in small pots are sending up spikes. In a rather sunny house, some specimens of the fine old Cyrtopodium punctatum occupy the centre, and in the summer these made a fine display with their large spikes of richly-coloured flowers and equally bright pendent bracts.

In the cool-houses we found a number of Odonto-glossums in bloom, besides Sophronitis, Oncidium varicosum, O. prætextum, O. Forbesi, and some species of Masdevallias; a specimen of M. corniculata having more than 100 blossoms. In another house a number of plants of Cypripedium iosigue were in flower, some Cologyne cristata well set for bloom, especially a plant of C. cristata alba. In a warmhouse the plants of Pescatorea Klabochorum and others of the class were growing vigorously, and some in bnd; also in flower several Dendrobium cruentum, D. formosum giganteum, D. Phalænopsis Schroderianum, Cypripedium villosum.

The Chrysanthemums were in excellent condition, and well furnished with their showy and useful flowers. Mr. Thorne has for years made a special study of cutting back a large number of his Chrysanthemums from the middle of May to the middle of June; and so well has he succeeded, that he has a certain proportion of his plants every year in dwarf bushes, and yet bearing large flowers equal to those which have not been cut back, and far more useful for general decoration.

In other houses were noted a fine batch of Amaryllis, of which about 100 are expected to flower at Christmas, a season for which Mr. Thorne also studies to get his houseful of Cyclamens, which are now beginning to bloom, to come in. In several houses were some of the handsome flowered Cannas, which are much liked here, still in bloom, and good batches of Streptocarpus, Saintpaulia ionautha, Freesias, Eucharis, Gardenias, Begonias, and other showy flowers, either in bloom or bud, and the large bitches of Crotons, Dracegas, and other coloured foliage-plants, as handsome as the flowering species.

The Vines in the fruit-houses have borne excellently, and a fine house of Muscat of Alexandria and Lady Downes Grapes after keeping well, are now in use.

FORESTRY.

TYPES OF BRITISH WOODLAND.

ALTHOUGH the terms woods and plantations are loosely applied to all land occupied by trees or bushes of any kind, yet the class of vegetation and scenic effects included within those terms vary greatly, both in regard to species and the system of management adopted. A great deal of this variation is un doubtedly due to the introduction of exotics into our woods, and amongst these the Coniferæ have exerted the most influence by a long way. Leaving out of account the purely ornamental kinds, they have, if not entirely changed the character of British woodlands, at least added a new feature to them. This is more particularly noticeable in hilly districts, where Spruce and Larch have been so extensively employed in forming new plantations of recent years. The effect of these introductions has been the more marked by the fact that the only indigenous representatives of the coniferous family are the Scots Pine, Yew, and Juniper, but of these only the first-named can be said to have any important effect upon our woodland seenery. It is a curious fact that the whole of these genera are confined, so far as their native habitats are concerned, to hilly districts, the Scots-Pine to the Highlands of Scotland, and the Juniper to the chalk downs of the south, while the Yew seems to have a more general distribution than either of the others. Probably they represent the surviving remuants of a more ancient type of vegetation than the prevailing deciduous families which now constitute the indigenous sylva of the south.

As a predominant timber-tree, or existing in unmixed

masses, the Scots-Pine is chiefly confined to the Scottish Highlands, and the sandy or gravelly Heaths of the South of England, although in mixtures it is ubiquitous. According to Mr. Gerald Lascelles of the New Forest, the Scots Pine was introduced into the plantations of that district in 1776, and from seed from these the tree has spread ever a considerable area of the heathy land of the Forest. In the same way, it is undoubted that the more or less Pine-covered tracts of Surrey and Berkshire, and those occurring on a more limited scale elsewhere originated from seed produced by plantations in their vicinity, as no traces of old forests of this tree exist in the south [of recent age]. Considering its wide range of distribution, the previous absence of this tree can only be accounted for by the thick block of deciduous trees occupying the heavier and more fertile soils of the midland counties which separates these southern tracts from the hills and moors of the north. At the present time, however, the Scots Pine makes itself completely at home in the south wherever heather abounds, and when left alone, it is afforesting considerable tracts of poor land entirely unaided by man, and in a manner leaving little doubt as to its fitness for the locality. The quality of its timber in these districts will also compare favourably with that grown in the north, for although the majority of the Scots Pine timber grown on rich soils in the south is of poor quality, that from poor soils, owing to its slower growth and finer habit, is quite equal to the average of any country or district. It is interesting to note how closely certain plants, botanically far removed from one another, are associated on certain classes of soils. Scots Fir and heather, for instance, are almost as inseparable in the mind of the forester as duck and Green Peas in the menu of the epicure.

In German forestry, the "soil flora" is made a special study, although it is probable that in old and unmixed forests, the original nature of the soil, and with it, the character of the surface vegetation, become greatly modified by the constant accumulation of humus and its resulting acids and ashes. It is a constantly noted fact, however, that the natural regeneration or extension of Scots Pinc is greatly determined by the presence of heather as a ground covering. One reason for this may be found in the shrabby growth of the heath plant, which affords sufficient protection to the tender Pine seedling without suffocating it as is the case with rank grass or herbaceous plants which die down annually. An almost invariable companion of Scots Pine is the Birch, and one which ultimately paves the way for the introduction and growth of other deciduous trees which finally crush out and exterminate the Pine by a system of natural rotation of cropping more or less general in the vegetable kingdom. When once Birch secures a firm footing in a Scots Pine forest, the extermination of the latter is only a question of time, although the struggle for supremacy may continue for many generations, and many causes may give now one and now another the advantage. A. C. Forbes.

(To be continued.)

FOREIGN CORRESPONDENCE.

CARNATIONS AS GROWN AT FERRIÈRES.

In the gardens at Ferrieres about 10,000 Carnation plants are annually grown in flower-pots. Some notes concerning the cultural methods pursued there may be interesting and useful to those readers of the Gard. Chron. who take an interest in this popular flower. The plants are raised from cuttings, which are taken off at intervals, from the beginning of the month of October till the end of February. In doing this the plants are not stripped of their young growths all at once, which would seriously disfigure as well as weaken the mother plants, at a time when all their force is needed in supplying flowers, but a few only are taken from each, choosing the cuttings from the healthiest plants, and never any shoot that shows a tendency to throw flowers.

In the preparation of the cuttings the knife is used

as little as possible, all the varieties that are strong and hrittle being taken off at a joint, the two bottom leaves breken off, and the tips of the "grass" shortened somewhat. As pots, small 60's, are employed, and these are well crocked with plenty of moss laid over the former, they are then filled with a sandy, leamy compost, not pressed in too lightly. The cuttings are then pushed in with the finger and thumb ten or twelve in a pet, according to the size and vigour of the variety. After being once afforded water they are placed in frames arranged on hot-beds out of doors with the tops of the cuttings almost teuching the glass; the temperature of the bed is kept at about 20° Centigrade (70° F.).

As soon as the cuttings are struck, they are potted off singly into thumbs, and placed exactly as before, but this time in a bed having a slightly lower temperature. Towards the end of March they are planted out in frames 4 inches apart each way, and when established they are pinched for the first time.

The second week in May sees them finally planted out in a good loamy soil, in beds, in the full sun, at a distance of 10 inches apart. About the end of the month of June the plants are looked over once more, and the points pinched out for the last time. At the end of August they are taken up and petted in 32's, and after being well watered, they are slightly protected for a few days from the sun before being placed in their permanent position in frames, where abundance of air is always allowed them, and where heat is only applied at night, or during wet or frosty weather. A house is set apart especially for the "collection," and to which abundance of air is afforded. At night a temperature of 6 to 8 Centigrade, say 40° to 58°, is kept up. but in daytime, with sun-heat, it rises semctimes to 18 or 20. Chemical manure is never used, but an occasional watering is afforded of liquid-manure from the farmyard. In the winter great attention is always paid to affording water, and then only when quite necessary.

Such is the method employed by M. M. Bergman, and a glance at the fine healthy collection of Carnations to be seen at Ferrières at the present moment speaks for itself as to the soundness of the method pursued. Enormous quantities of flowers are cut daily all through the autumn and winter months, from considerably more than a hundred varieties. I give the names of a few of the best:—Lafontaine, bright yellow, striped and edged with rose, very large; President Carnot, very dark crimson-red, very large; Madame Ernest Bergman, pale pink, very large; Jean-Pierre Nugues, bright red; Schwaller, Jean Sisley, Doctenr Raymont, Contesse de Paris, Blanche, Esperance, Hooper, and Chateaubriant. A. C. Cook,

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. White, Burford, Dorking,

Chysis.—Plants of Chysis bractescens, C. Linminghei, C. kevis, C. Chelsoni, and C. Sedeni, whose new pseudo-bulbs have attained their full size, will stand in need of some attention at this season. To bloom these plants satisfactorily, they require a long period of rest to induce complete maturity, affording them, from the present time till the leaves turn yellow and fall off, a gradual diminished quantity of water at the roots until it is discontinued. As soon as the foliage begins to change its colour, the plants should be placed in the lightest part of the Cattleyahouse.

Odontoglossum citrosmum. — This lovely species will by this time have completed its growth, and when this has occurred, water should be gradually withheld, and in a few weeks quite discontinued. Owing to dryness at the root during the resting period, the pseudo-bulbs will shrivel a good deal, but this is not to be feared, it not being inpursons to the plant, as when the flowering period arrives they return to their normal condition, if kept well moistened for a few days. Occasionally a few plants will recommence to grow as soon as the current season's pseudo-bulbs are made up, but if such plants are treated as above described during the resting

season, such growths make little or ne progress, and the plants seldom fail to flower at the right time.

O. Reichenkeimi and O. lære, having likewise finished their growth, should receive but little meisture at the root during the winter. These three species should be placed in the lightest and coolest part of the Mexican or intermediate-house during the season.

Trichopilia crispa, T. lepida, T. tortile, T. Wagnerii, T. coccinea, T. Galeettiana, T. suavis, and its variety alba, having also made up their growth for the season, should be very carefully supplied with water, or the leaves will soon get spotted. So long as the bulbs remain plump, no water is required, and only when shrivelling becomes apparent should water in moderate quantity be afforded. In some gardens some of the species mentioned will have started to grow, and in this case the plants should be afforded heat and moisture till these growths are fully made up. Trichopilias in the resting stage should occupy a light shelf in the Cattleya-house, and be near to the light. T. fragrans, a species that will new be in flower, is one of the best of the fragrant Orchids, and deserves more general cultivation than is now the case. The blooms, which are white, are good for decorative purposes generally. It requires a little more warmth than the Odontoglossum-house affords during the winter, and the coolest part of the intermediate-house will be found the best place for it. After flowering, it needs but a very small quantity of water at the root, and care should be taken that no water lodges in the young breaks at any time, or they will decay. Trichopilia lana thrives under

Zygopetalum Mackaii and others. — In the warm stove-house, this plant grows well, and produces strong flower-spikes, which are seen at this season at their best. When flowering is passed, or the spikes removed, the plants may be reported or top-dressed, and as it is a free-rooting species, plenty of pot-room and a great depth of compost are required. The pots should, therefore, be filled to about a quarter of their depth with drainage materials, and good turfy loam, fibrous peat, with abundance of cooks mixed with these, will form a suitable compost. When the plants have become thoroughly rooted, a thin layer of living sphagnum-moss may be placed on the surface of the compost, which is found very conducive to the health of the plants during the growing season. The rare Zygopetalum Burkei, now in flower, requires a course of treatment identical with that recommended for this species; Z. maxillare being at rest should be placed at the warmest end of the cool-house, and be kept moist at the root at all times.

FRUITS UNDER GLASS.

By W. Port, Gardener, Highelere Costle, Newbury,

Pines.-To obtain ripe fruits in May and June, which is a part of the year when home-grown Pines are most appreciated, some of the earliest plants, or those most likely to show fruit, should be selected at this date, and afforded a greater degree of heat. points to be observed in a plant that is likely to show fruit quickly, are a thickening of the collar, whilst the centre leaves become somewhat short and spread apart. If a sufficient number of such likely plants be selected let them be accommodated in a house or division of the pinery by themselves, or if such places are not at command, a light position at the warmer end of the fruiting-house may be utilised instead. Afford the soil a thorough watering, and afterwards, as may he necessary to keep it moderately moist till such time as the fruit becomes visible in the resette of heart leaves. A bottom heat of 85 to 90 should be afforded and steadily maintained, and a top heat of 65 to 70 with a rise of 10 by sun heat, and a slight increase of atmospheric moisture. It is not advisable to start more plants at this season than are really required, those of a suitable age throwing up fruit more readily and strongly a month hence.

Succession Pines.—The remainder of next season's stock of fruiters may be kept cool and dry, as before advised. Those suckers which were potted early, and are well rooted, will need very great attention if the bottom-heat be supplied by means of the heating apparatus, as any neglect in watering is apt to cause some of those that are very dry to show fruit when shifted in the spring, and subjected to a higher temperature. All of the young stock of Pines should be afforded plenty of room, which may usually be provided by clearing out plants that have fruited, or sacrificing

some of the unsatisfactory plants. Centinue to take suckers when sufficiently large, and pot, and plunge them into a bettem-heat of 90°. It is only by rooting a small number of suckers at various seasons that a proper supply of fruit can be ensured where the stock of plants is a limited one. Be sure to get a quantity of suitable seil under cover in readiness for the February re-potting.

Cucumber Plants.—No attempt should be made by increasing the temperature to push the plants on during the cold and dull weather, as by so doing the leaves are rendered thiu and growth attenuated, and liable to the attacks of various injurious insects or diseases. Let the roof-glass be kept very clean, so as to ensure all the sunlight that is to be obtained at this season; pay close attention to stopping and tying the shoots, and removing old leaves. The temperature at night should be 60° to 65° in frosty weather, with a rise of 10° in the daytime with sunheat. Do not overcrop nor allow the fruits to hang till fully grown, or the plants will soon go out of bearing. Should red-spider appear on the foliage, syringe it lightly with soft-soap, 2 ez. in 1 gal. of water, or use an insecticide. Aphis can be destroyed by fumigation with tobacco-powder. Keep the soil regularly but moderately moistened, and apply liquid-manure only sparingly for the uext month or longer.

PLANTS UNDER GLASS.

By JNO. McINTYRE, Gardener, Woodside, Darlington.

Winter Pests in the Store.—The use of much fireheat, in order to keep the necessary degree of warmth, favours the increase of thrips, red-spider, and brown scale, and the more so when the syringe may not be freely used because of the moisture-laden air of the house. However, by taking advantage of sunny days te afford the plants a good syringing, semething may be done to keep thrips and spider in check. It is very necessary to well moisten the paths and bare surfaces in the stove several times a day.

Decorative Plants.-Codieums (Crotons) should be allowed a period of rest at this season, but the plants which were struck in the autumn may be kept in a partially active state, although the gardener will find it difficult to attend to these details when he has only one stove and no warm pits, and he has therefore to accommodate all of these hot-house plants in one house. I find a place for stove plants struck in the autumn, which have to be kept growing, in a Melon house during the winter months, removing them early in the spring to one of the steves. furnish material for house decoration, the species which are more enduring of cold have to be used, both foliage and flowering; and first amongst these are the Palms. Of these, I may note such species that I have found useful at this as well as at other seasons, viz., Kentias Fosteriana and Belmoreana, which I would place amongst the more useful, they standing a lower temperature without injury than some other hothouse Palms; then comes Phœnix rupicola, a very pretty and valuable decorative species, but less hardy than the Kentias above mentioned. Then we have species of Rhapis, plants well suited for winter decoration, Seaforthia elegans is not sufficiently hardy to be used for any length of time in the dwelling, although it is a most graceful subject; as is also Areca lutescens, but which must not be made use of in cold weather. It will be understood that any of these tender species of Palms may be used for a single day or night if frost can be kept from them. In rooms that are warmed, Cocos Weddelliana, Geonoma elegans, and G. gracilis, when of a suitable size, may also be employed throughout the winter months in table decorations, or as subjects to place in vases.

If Chrysanthenums be used in entrance halls, it is well, for the sake of improved effect, to mix Ferns freely with them, especially to form a kind setting for them, the Ferns helping to hide bare stems and flower-pots.

The Warm Fernery.—If Euphorbia (Peinsettias) pulcherrima is grown well and in quantity, the plants may be stood about among the Ferns when the bracts have expanded, and the plants become attractive. Every morning the fernery should be carefully examined, and decaying fronds cut off and removed, affording water to all plants in need of it, being careful to afford only as much as will avert the desiccation of the roots of Ferns that are resting, or which are devoid of fronds. The fernery is largely drawn upon at this season for material wherewith to furnish vases, and the Gymnogrammas are especially useful in this way.

THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring.

General Work.-Trees and shrubs recently planted should be securely staked and tied, in order to steady them, or rooting will be greatly hindored, and if convenient the roots should be well mulched with strawy litter. The leaves having now fallen from deciduous trees and shrubs, should be collected and removed to the rot-heap, or stored under thatched burdles for forming botbeds. A general clearing-up should then take place, and the lawns, borders, shrubberies, &c., be made presentable for the winter. If there are parts of the lawns which have sunk below the general level, rendering machine-mowing difficult, these should be unturfed and filled up with new soil, fresh loam if obtainable, trodden firm and level, and the turf returned to the spot and well beaten and rolled. This sort of work may be undertaken at any time during the winter when the ground is not frozen. Never beat turves when frozen in ever so slight a degree, but wait till they thaw before doing so; nor use light rich soils, which are sure to sink considerably, besides causing an undue growth of the grass, and a difference in colour to the rest of the lawn. In the event of very severe weather ensuing, half-hardy or recently-removed evergreen shrubs may be afforded some slight amount of protection; and the prunings of hardy evergreens afford a good sort of material for this purpose, and they do not look so unsightly as bast mats or the like. As frosty winds generally do more damage to tender things than still frosts, it is well to protect them in some manner

Pampas Grass.—This plant, when aged, will often show signs of exhaustion, a state of things due to the poverty of the soil in which are the roots, and which may be improved by mulchings of farmyard manure. In the case of clumps in conspicuous parts of lawns where manure would not be tolerated, the turf may be cut and rolled back out of the way, and the soil for some distance above and round about the extremities of the roots removed, its place being filled with rich loamy soil. In doing this the roots should be but little disturbed—no more indeed than is absolutely necessary.

Alpine Pinks.—At this time of the year much damage is done to these plants by sbugs, and as these creatures lie concealed during the day beneath the foliage, the soil beneath this should be heavily dusted over with some dry wood-ashes, mixed with fresh soot; two or three dressings of which, applied during the winter, generally sufficing to stop their ravages, as well as affording a suitable food for the plants.

Bedding Begonia tubers lifted from the beds some weeks ago and left to become dry, may now be examined, the adhering earth removed, and the tubers stored in shallow boxes or baskets, placing these in some place to which frost has no access.

Trollius curapaus (Globe Flower) may be grown to perfection if planted in a moist border, or better still by the side of a stream or on the banks of a pond, and autumn is the best time to propagate the plant, by division of the root. Some growers do this in the spring, but as a rule, the display of bloom the following season is very short-lived, the plants not having time to get established before the dry cold winds of March set in.

THE HARDY FRUIT GARDEN.

By G. Woodgate, Gardener, Rolloston Hall, Burton on Trent.

Inserts Injurous to Fruit.—The Slug-worm, or larvee of the Sawfly Scłandria cerasi, is another insect which plays have with the foliage of the Pear and Cherry: dusting the trees with fresh slaked lime will destroy the larve which it comes into contact with, but those which escape descend into the soil, remaining just beneath the surface, thus rendering their removal a comparatively easy matter. It should be taken away to a depth of about 3 inches, and charred, and as numerous pape will go with it, their numbers another year will be very much lessened. The Black Currantmite, although an exceedingly small insect, is capable of doing a great deal of mischief, but its presence may be readily observed at this season when the bushes are bare in the enlargement of the terminal buds. All shoots affected in this manner should be cut off and put into the garden-furnace forthwith. This done, the bushes should be sprayed with a solution, made by boiling 5.1b. of soft-soap in 10 gallons of water, to which it be, of wathing soda and 2 lb. of flowers-of-sulphur are incorporated with each gallon of water, keeping the ingredients well stirred till they become dissolved; then boil the mixture for thirty

minutes. Before using it add 15 gallons of water, and warm it up to 100°. The spraying should be performed at the present season, and again in the month of February. Another reliable remedy is to dress the bushes with a petroleum emulsion, see p. 606.

Fruit Tree and Bush Planting, &c.—The operations which most claim attention from the gardener in favourable weather are planting and pruning, and these should be expedited as much as circumstances will permit. Be sure to make all the freshly-planted trees secure against wind-waving by staking them, doing this preferably as the work of planting proceeds. Let the ground over the roots and some little distance further, be afforded a mulch 3 inches thick of half-rotted stable or farmyard litter. Autumnal planting, it should be remembered, is to be preferred to spring planting, the roots being to some extent established in the soil by the time that we usually experience the drying harsh winds in the spring, and the shrivelling of the bark of the young shoots always noted in spring-planted trees is averted.

Pruning.—The pyramids and bushes of the Apple and Pear growing in the borders of the kitchen garden should be the first that are primed, in order that the necessary preparation of the land for cropping may be Before commencing to prune any tree or bush, an examination should be made for insectpests, and if any of these are present, means should be taken to destroy them. Trees which bore heavy crops of fruit this season should receive a drossing of good turfy loam and rotten manure in equal parts, well mixed together, first removing some of the surface soil as far as the roots extend. Those trees and bushes which have made good shoots will need no top-dressing; whilst such trees as have made weak growth, or are naturally weak growers, should be afforded one or two good applications of the drainings from the stables or cow-sheds during the winter. Hard-and-fast rules in this matter, which would be applicable to any variety of Apple and Pear cannot be given, and each tree must be treated according to Shoots of the season's growth suitable for making scions for grafting purposes may now be taken, doing this before beginning to prune. These shoots doing this before beginning to prune. should be clean and well ripened; having attached the correct name to each lot, lay them in, in thin rows, 6 inches deep, in a cool, shady position.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead,

Early Potatos.—If the Potato is forced very early, it will be advisable at this season to make a selection from the planting sets of the Ashleaf (Marjolin of French gardens, of which there are several varieties more or less early, that is, they produce edible tubers in a little more than three months after planting them. The variety Royal Ashleaf, synonymous with Early Alma, Early Racchorse, Royal Ash-top, Myatt's Ash-leaf, &c., although excellent for an early The variety Royal Ashleaf, synonymous with Royal Ash-top, crop out of doors should not be chosen for frame or pot-planting, the tubers not growing so close together ound the base of the stem as in the true Ash-leaf, These sets may be placed upright in boxes having finely-siftedlear-mould spread over the bottom. Having filled the box, shake in some leaf-mould between the tubers so as to fill up the spaces between the sets, and put the boxes in a house having a warmth of 45 to 50. Here they may remain till the soil has become partially penetrated with the roots, but not matted, partially penetrated with the roots, but not matted, that is in about two or three weeks from the time of setting them in the boxes. They will then be in a fit state for being planted in the frames, &c. It is scarcely advisable to plant Potatos very early in frames where the heating depends entirely upon fermenting materials, but pits should be chosen for this proposed with heat materials. purpose which are furnished with hot-water pipes for affording top-heat. The woodwork, walls, and glass should be well cleaned, the walls being lime-washed. This done, till the pits to within 2 feet of the top with about equal proportions of tree leaves and stable-manure, which have been turned several times. Make the beds quite firm as the work proceeds, and when the desired height is reached, place a layer of moderately rich light soil 9 inches thick. The pit should be got in readiness for planting a week previously, so as to allow for the settlement of the beds and the due warming of the soil. If heated puts do not exist, early Potatos may be obtained by growing as many as space can be found for in 8-inch or larger sized pots, filling them to two-thirds of their depth with suitable soil, one tuber being planted in each, or three in a 12-inch pot. The earthing will each, or three in a 12-inch pot. The earthing will occupy the rest of the space in the pot. These pots may be stood on the floor of any house where a

temperature of about 45 to 50° is maintained, early started Peach-houses or vineries just suiting them at this stage.

Spring Cabbage.—The Cabbage quarter, when the surface is dry, should be hoed over and the weeds pulled up and collected. Generally, Cabbages have not made much growth this season, and the plants are not large or succulent. The late rains have somewhat consolidated the soil, which should be brought well up to the stems of the plants. Before the forking over or stirring the soil is undertaken a sprinkling of wood-ashes and soot in mixture may be afforded.

Salacting.—Plants of Lettuce and Endive standing in frames should be abundantly ventilated in fine weather, all decaying portions being removed as soon as seen. Late Endive may be lifted and housed where room can be found for them on the borders in an orchard or late Peach-house, where, if lifted with a large ball and laid on the border, and the roots covered with a little fresh soil and afforded water, they will increase in size. A sufficient number of the earliest batch should be kept in a blanched state to meet requirements. The blanched shoots of Chicory form a useful winter salad, and a few roots should be introduced to the Mushroom-house weekly, and blanched similarly to Scakale. Mustard and Cress may be sown at short intervals of time in shallow boxes, and grown in a warm house with a rather dry atmosphere.

THE APIARY.

By Experier.

Hires.—One of the best hives for ordinary use is the one known as the "Cowan." It is very simple in construction, and can be made by any handy-man at a small cost. All the hoards used should be dry, or they will warp under the sun; and the hives when made should be primed before being painted, which will improve the wood largely. If it is possible, the best way is to make them in the winter, prime and storo them till the spring, and then afford three coats of paint, and number them all. An apiary no doubt looks best with the hives all placed at a certain distance apart, and numbered; and in addition to this you can, if you keep a register, refer to any given number, and see at a glance what work the bees have done, and what state they are in. A good sort of hive consists of a body-box made of 1-inch board, and made to take from eight to fourteen or fifteen frames. It should be $11\frac{1}{2}$ inches from front to back, and $\frac{1}{2}$ inches high, measured inside; the It should be 111 inches from edges of the top, front, and back are rabbeted and fitted with strips of tin for the ends of the frames to rest upon. The frames should be 14 inches to rest upon. The frames should be 14 inches long and 8½ inches deep, 2-inch thick, the bottom bar 1-inch, and the side bar 1-inch. The top bar must be 17 inches in length. The floor-board should be made of 11-inch stuff, and two wedges should be let in to strenghten it. A passage; of an inch deep and S inches wide is ent out of the floor-board, sloping towards the centre of the hive; the outside case should be made of 2-inch board, or a little stouter if necessary, and made to rest on the floor-board. To prevent rain getting in at the junction between the outer covering and the floorboard, strips of wood should be nailed on at the angle. Nail a piece of wood between the outer cover and the front of the body box, which will prevent the bees getting into the outer case, or it may be left loose so that the body box can be brought backwards or forwards. Beneath the porch roof a small block of wood is secured, grooved out a little so as to allow two shutters to slide for enlarging or contracting the space as may be desired. The roof fits on to the top of the sides, and should incline towards the back, and may be painted, or covered with zinc or Willesden card and painted. It can be fixed on the sides by a fillet nailed on to the hive or the roof itself. The alighting board should be 15 inches in length, and slope towards the ground; this will enable a good many bees to get into their hive when coming home laden and tired. The bottom of the hive should be 6 inches in height; and a piece, 6 inches high, should be nailed on at the back to keep it secure.

MR. HARMAN PAYNE.—At the late Chrysanthemum exhibition in Paris, Mr. Harman Phyne, the Foreign Secretary of the National Chrysanthemum Society, was made a Chevalier of the Merite Agricole. This is a compliment to British horticulture, and an appropriate recognition of the claims of Mr. Harman Payne.

CORRECTED AVERAGE TEMPERATURE FOR THE EN-SUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—41°.

THE results of some experiments Experiments in on the growth of Potates on the estate of Lord Rosebery at on the Earl of Dalmeny, were exhibited at Earm.

the great Chrysanthemum Show in the Waverley Market in Edinburgh last week. It seems that the lines followed in these experiments were laid down by Mr. HUNTER, District Analyst, and by Professor McAlpine. The cost of the special manuring reached to 32s. 6d. per acre, while the most profitable returns seems to have been obtained from an expenditure of 9s. per acre on superphosphate of lime, which seems the most profitable dressing for a crop of Potatos on such soils as those at Dalmeny. This dressing alone increased the yield of Potates 3 tons per acre.

The gross returns were most encouraging; and while doubtless confirming the value of superphosphate as a manure for Potatos, also attest the rejuvenating and recuperative energy of new blood in increasing the crops of Potatos. It is only as we realise that the average yield does not greatly exceed 7 tons per acre, that the full meaning of the results obtained at Dalmeny, or on other experimental plots, are realised.

"Up-to-date" Potato yielded 195 tons per acre, and has suddenly leapt into the first rank for

quantity and quality; British Queen, 18 tons; Jeannie Deans, 16 tons; Main Crop, 13 tens per acre. &c.

The best results on the whole, in the case of grain crops, were reaped from a mixture of superphosphate, lime compost, and sulphate of ammonia, and on all the grain crops sulphate of ammonia gave better results than nitrate of soda. Experiments are also being carried out at Dalmeny for the culture of seil-bacteria for the inoculation of the soil, with those that are most powerful in the liberation or retention of nitrogen.

THE Board of Directors of the Conveyance of Great Western Railway Com-Agricultural. Farm and Dairy pany have issued to the public, Produce. in a concise and handy form, a pamphlet embedying particulars of Scales of Reduced Rates recently adopted by the Company for agricultural, farm, and dairy produce carried by passenger and goods trains respectively.

The rates applicable by passenger trains have been specially provided for small consignments of farm and dairy produce, such as eggs, butter, cream. poultry, game, fruit, and vegetables, with the view of enabling the farmer to supply his products direct to the consumer; and will no doubt be much appreciated by these who require a rapid service.

The scales of reduced rates granted for traffic sent by goods trains embrace fresh meat, dead peultry, dead rabbits, eggs, butter, fruit, and vegetables, and apply to quantities of 10 cwt., 1 ton, 2 tons, and 3-ton lots respectively. One important advantage in connection with these rates is that they will cover mixed consiguments of any or all of the articles named, so that farmers may combine to send away varying small quantities (exceeding 3 cwt.) amounting in the aggregate to 3 tons, 2 tons, 1 ton, or 10 cwt., and have the whole of the separate lots charged at the rates applicable to those quantities, the only stipulation being that the traffic must be sent at one time from one station to another statiou; and that the carriage must be paid by one sender, or by one consignee.

In addition to the reductions thus announced, rates for the same descriptions of traffic have been specially arranged to London, in ne case exceeding the scales above referred to; and rates have also been given for consignments of less than 10 cwt., by goods train, in order to supplement the facilities offered by passenger train for small quantities going to the Londou markets.

The company have also revised and largely reduced the rates for cider and perry from the producing districts of Devonshire, Somersetshire, Herefordshire, and Gloucestershire; and are making numerous and important reductions in the charges for other articles of agricultural traffic, such as Potatos, Turnips, Parsnips, Carrots, Mangel Wurzel, feedingstuffs, and manures.

It will be observed that the Great Western Company is evincing an earnest desire to assist the agriculturist; and it now remains for the farmers and gardeners to see how they can best obtain (by combination or otherwise) the fullest advantage of the concessions given, and justify the experiment that is being made by bringing about such a development in the quantities of home produce forwarded by railway as will compensate for the loss of revenue that will otherwise result from the reduction in the charges.

We append three schedules of immediate

interest to our readers. For others application should be made to the officials at any station of the Great Western Railway.

Conveyance by Passenger TRAIN.

Scale of Rates for cream, eggs, honey, game, dead poultry, dead rabbits, fruit, vegetables, and Mushrooms, at owner's risk, inclusive of delivery within the Company's ordinary Free-cartage boundary:

WE have great satisfaction in The New Agri giving prominence to the followcultural Rates Act. Important ing decision uphelding Decision. results arrived at in the Worthing Case: - "At a Special Petty Session

held under the Act at Edgeware, on Tuesday last, the Surveyor of Taxes for the Hendon Union appealed against the decision of the Overseers and Assessment Committee, that "glasshouses" were to be included in the term

"agricultural land," as defined by the Act, and were therefore entitled to the relief from rates afforded by the Act.

The Market Gardeners, Nurserymen, and Farmers' Association, as representing the trade, had taken up the case on behalf of the occupiers affected, and Mr. A. GLEN appeared for them. The Overseers and Assessment Committee were represented by Mr. Page. The Surveyor of Taxes appeared in person. After argument, the Bench unanimously decided against the surveyor, on the authority of Purser c.

LINNEAN SOCIETY OF LONDON: November 19.—Mr. A. D. Michael, Vice-President, in the Chair. Dr. D. Morris, C.M.G., exhibited from the Royal Gardens, Kew. the inflorescence of Pterisanthes. polita, a singular species of the Vine order (Ampolidee), received in 1894 from Mr. H. N. Ridlen, F.L.S., of Singapore, and now in flower for the first time in Europe. It is a slender plant, climbing 15 to 20 feet over trees, native of the Malay Peninsula, Sumatra, and North Borneo. The cordate leaves are entire and toothed; the tendrils bifurcated, with the lower branch bearing a pendulous, flat, fleshy receptacle, irregular in outline, reddish-brown in colour, and

FIG. 121. - SENECIO FOSTLRI AS GROWN AT CASTLEWELLAN. SEE P. 681.)

the Worthing Local Board, a well-known easo on which, it will be remembered, the Association obtained the judgment of the Court of Appeal in favour of the trade. The decision in the first case governed twenty-two others which were down for hearing, and in all the cases the surveyor was ordered to pay the costs."

OUR ALMANACK.—Sceretaries of Horticultural Societies and others, are carnestly requested to forward immediately, the dates of Show Fixtures and of Meetings of Estancial and Horticultural Societies of any kind for 1897, for insertion in the Almanack, to be published in our issue for January 2.

varying from I to 6 mehes in length, and 1 to 11 inch in breadth. The flowers, embedded on both sides of the receptacle, are mostly hermaphrodite, while on its margins are ranged several uni-sexual or sterile flowers on slender pedicels ½ to 1 inch long. The fruits, when produced, are small flask shaped berries with one to four seeds. Pterisanthes is closely allied to Vitis, but shows in a more interesting manner the true nature of the tendrils, and a special modification of the receptacle suggested only in Vitis macrostachya.—Some supplementary remarks were made by Mr. C. B. CLARKE, F.R.S., and Sir Hugh Low, G.C.M.G. Dr. Morras also exhibited dried flower-stems of the Australasian twin-leaved Sundew (Drosera binata, Labill.), received at Kew from the Sheffield Botanic Garden. In this instance, the stems

were 3 feet 6 inches high, bearing about thirty to fifty large pure white flowers, nearly 1 inch across. The plant as usually grown in gardens in this country is seldom more than 9 inches to a foot high. Mr. W. G. RIDEWOOD, B.Sc., F.L.S., road a paper on the "Structure and Development of the Hypotranchial Skeleton and Larynx in Xenopus and Pipa." A paper was then read by the Rev. T. R. Stebbing, F.R.S., F.L.S., "On the Collection of Amphipoda in the Copenhagen Museum."

SACRED TREES. On Wodnesday, the 25th ult., the opening lecture of the session of the Royal Society of Literature was delivered by Dr. Phene (Vice-President). Mr. James Curtis, F.S.A., presided, in the unavoidable absence of the President the Lord (hancellor). The subject was the transportation of their sacred trees by the Greek and Asiatic colonists in their migration to Western Europe. The daphnephoria was, of course, a local ceremony along the sacred way from Delphi to Tempe. The importation and the planting of the sacred Olive by Athena in the Erectheum was also apparently local; but the colonists carried the Vine and other trees with them to their places of settlement, and instituted the Dionysia in Greece, known as the Bacchanalia in Italy, &c. Certain tribes mentioned by Herodotus, Strabo, &c., were traced as carrying fruit trees, which were found to accompany the Bacchic ceremonies, and reasons were given for assuming that the ceremonies of the Ambrosia, one of the festivals of the Dionysia, were those which accompanied the life-giving food of the fruit trees. The growing trees were conveyed in pots, shown by Indian sculptures and the name of the third day of the Dionysia, $\chi \dot{\psi} \tau \rho \sigma s$ (a pot), from the trees in pots and vases then offered. The fruits of certain trees, described as Apples, were mythologically the food of the gods of Olympus and of Scandinavia, &c. These fruit-bearing trees and ceremonies were traced to Western Europe, and the councils of the church down to the eleventh century were occupied in suppressing the worship of these trees. The author had found from personal travel the fruits of these trees and the people mentioned by Horolotus from Britain to India, by a course vid Italy, Greece, &c.; the names of the fruits in some of the settlements being still those mentioned by the ancient writers.

THE ROYAL GARDENERS' ORPHAN FUND.—
The monthly meeting of the committee took place at the Horticultural Club on the 27th ult., Mr. WILLIAM MARSHALL presiding, when the following special receipts were announced:—Rugby Chrysanthemum Society, per Mr. W. Bryant, £6 4s.; Bradford Paxton Society, per Mr. R. Scott, £3 10s.; Mr. J. T. Powell, Park Place, Henley, box, £2 6s.; Mr. R. Scott, Moorfield, Bradford, box, £2 6s.; Mr. W. Bates, Cross Deep, Twiekenham, £1 13s.; Penshurst Gardeners' Association, per Mr. E. Baker, £1 11s.; God; Mr. J. McKerchar, Holloway, £1 1s.; Croydon Chrysanthemum Society, per Mr. E. Beckett, £1 1s.; Mr. H. B. May, Edmonton, £1 1s.; Mr. J. Crook, Tarde Chards, sale of flowers, £1; and small sums under one pound, £1 7s. 7d.

NATIONAL AMATEUR GARDENERS' ASSOCIATION.—A lecture was given at the meeting of this association on Tuesday last, by Mr. E. T. Cook, on "Some Ways of Making Gardens Beautiful," illustrated by oxy-hydrogen lantern views. The chair was taken by Mr. T. W. Sanders, and there was a large company present. The views were of hardy plants growing in various parts of the British Isles, and the series of English cottage-gardens created much interest. This association has grown to large-proportions, and holds its meetings monthly from henceforth at Winchester House, City

THE EDINBURGH FIELD NATURALISTS' AND MICROSCOPICAL SOCIETY.—The fourth and fifth Parts of the *Transactions* of this Society are now before us, and we are pleased to find that the Annual Report is satisfactory. The papers included in these Parts are so many testimonies to the skill of their

(mostly) well-known writers. Among the more interesting and botanical subjects treated of are: Notes on Japan by Dr. Watson; Mr. G. Don's Specimon of Holy Grass, A. B. Steele (is the scientific name of Holy Grass mentioned?); Poisonous Plants by M. King; and Popular Delusions in Natural History by Dr. Traquair. There is an In Memoriam notice of the late Dr. Robert Brown by A. E. Davies, Ph. D., illustrated with a good and pleasing portrait. Dr. Brown was, it may be remembered, the first President of this Society, and died in October, 1895.

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT ASSOCIATION.—We are informed by Mr. S. HEATON, Hon. Sec., that the monthly meeting of the above association will be held at Warburton's Hotel, Newport, on Saturday, Dec. 5, 1896, when the Rev. H. EWBANK, Ryde, will read a paper on "A Garden in the Isle of Wight." The chair will be taken at 6.30 P.M. by Dr. J. GROVES, B.A, J.P.

Presentation to Mr. G. Bunyard.—OnWednesday evening, November 25, an interesting ceremony took place at the residence of Mr. GEORGE BUNYARD, of the Royal Nurseries, Maidstone, when a representative committee of the employés, composed of the heads of the various departments, assembled to present their employer with a testimonial to celebrate the centenary of the firm's existence. In the presence of Mr. and Mrs. Bunyard and family, Mr. Buss, as chairman of the committee, made the presentation, accompanied by a few suitable remarks, followed by some supplementary explanations by Mr. Wells. secretary. The testimonial took the form of a handsomely illuminated address on vellum, comprising a sketch of the Maidstone offices and heraldic and other designs, and set in a massive carved Oak frame of conventional Oak leaves. The address having been inspected and admired by all present, Mr. BUNYARD expressed his appreciation of the gift in a few wellchosen words.

THE SEASON IN SOUTH AFRICA.—Writing from Grahamstown, an old correspondent says:—"We are having a very bad season for gardening and farming, for the drought, the locusts, and the rinderpest, have played sad havoc. All the corn has to be imported, and soon the meat will have to be imported as well. It is now three years since we had sufficient rain to reach to the roots of the fruit trees. The bad state of things is not general, i.e., does not affect the whole of South Africa alike; but over most parts of the country even Indian-corn, that thrives so well here in ordinary seasons, has failed, and the supplies have to be imported from America.

DEVON AND EXETER GARDENERS ASSOCIA TION.—On Wednesday, November 18, a meeting of the Devon and Exeter Gardeners' Association was held, when Mr. George Foster, gardener to Mr. II. HAMMOND SPENCER, Glendarragh, Teignmouth, read a paper on "The Culture of the Chrysanthemum." The chair was occupied by Mr. F. HANNAFORD, Teignmonth, there being a very numerons attendance. Mr. FOSTER is one of the best cultivators of the flower in Devonshire, and his lecture was listened to with much attention by the audience, among whom were many of the gardeners of Exeter and the environs. His lecture was divided into ten headings, including growing for exhibition, striking cuttings, treatment of the same, petting off, stopping the shorts, composts, affording water, taking the buds, housing, &c. The discussion which followed the reading of the paper brought out many important details, amongst others that Mr. FOSTER waters in the dry summer months-July, August, and September-with sootwiter, about 1 qt. of sout to 4 galls of water, thoroughly well mixed. To a question of Mr. Powell's, he replied that he had sometimes grafted a fine variety of incurved with a weak habit on the stem of an inferior variety with a strong habit, and with considerable success. Mr. Hope produced a list of fifty Chrysanthemmms grown in the Topsham Road Nurseries of Mr. Veitch's grandfather in 1851 and 1852, some of which were still cultivated. A question was asked as to whether the lecturer had ever grown Chrysanthemums in Jadoo fibre. He said he had done so, and with much success. The great point to be observed when growing plants in Jadoo was to see that they were not afforded too much water, for that material being naturally retentive of moisture, less water was required.

MESSRS. J. CARTER & CO.—Messes. Carter sond us the following letter referring to the supply by them of 200 tons of vegetable seeds for growing in the northern districts of India threatened with scarcity.

"India Office, Whitehall, November 17, 1896.

"Gentlemen,—I am directed by the Secretary of State for India in Council to acknowledge receipt of your letter of the 6th inst., forwarding invoices for the additional seeds shipped by you, on account of the Government of India, from London and Marseilles on the 6th inst.

"Lord George Hamilton recognises with satisfaction the facilities and assistance you have received in organising these large and unaccustomed shipments from Her Britannic Majesty's Consul at Boulogne, the Custom authorities at Folkestone, the Directors of the Peninsula and Oriental Company, and the Goods Managers of the South Eastern and Great Eastern Railway Companies.

"His Lordship also desires me to convey to you the expression of his appreciation of the promptitude and foresight shown by you in successfully carrying out so large a portion of the order of the Government of India, within the very limited time allowed for its execution.

"I am, Gentlemen,
"Your obedient servant,
"(Signed) A. GODLEY."

YORK FLORISTS' SHOW.—An exhibitor, well known in the north, writes to express the dissatisfaction felt by himself and other exhibitors of fruit at this show, at the erroneous decisions of the judges, eiting an instance of a gardener showing in the class for six kinds of dessert fruits being disqualified on the ground that an Apple which he showed—Emperor Alexander—was not a dessert variety. Emperor Alexander is often used as a dessert Apple, but in the most authoritative record we have, viz., that of the National Apple Congress, held at Chiswick in 1883, and published in Mr. Barron's British Apples, 1884, the Apple in question is classed among the culinary varieties (see p. 183, n. 354); see also "Apples suited for Yorkshire," p. 116, where it is also included among the culinary Apples.

THE WORD "NATIONAL."—In this country, if a foregathering of two crock-boys choose to call themselves the National Society of Pot-crockers, there is nothing to prevent them. In France things are ordered differently, as the Society of French Chrysanthemists found when it wished to add the word National to its title. Local préfets and metropolitan ministers had to be asked, and the reply of the Minister of Agriculture was, if courteous in form, very decidedly negative in substance.

"DICTIONNAIRE PRATIQUE D'HORTICULTURE."
—The article Primula, to which a large portion of the 55th fascicle is devoted, affords an illustration of the manner in which the work of Nicholson has been "mis a jour" by his French editor, M. MOTTET.

M. Ed. Pynaert was the object of an ovation recently when the pupils of the Ghent School of Horticulture celebrated the thirty-fifth anniversary of the Professor's career as a teacher. The director of the school, M. Rodigas, in the name of the King and of the Belgian Government, presented M. Pynaert with the Civic Cross of the first class. There are many of our readers who from personal knowledge of the Professor, and of his colleagues, will warmly sympathise with this manifestation.

A REVISION OF THE GENUS VANILLA has been published by Mr. Rolfe in the thirty-second volume of the Linnean Society. Fifty species are described, among which, for economic purposes, the Mexican V, planifolia is the most important. V.

pompona, V. Gardneri (Brazil). possibly, together with some others, are used for purposes of perfumery, &c.

MR. FALCONER, who is well remembered as a press-man on this side of the Atlantic, has resigned the editorship of *Gardeniny*, in consequence of his acceptance of the Directorship of Schenley Park.

HEPATICAS.—In the October number of the Wiener Illustrierte Garten Zeitung, Dr. GÜNTHER RITTER BECK VON MANAGETTA has a monographic sketch of the genus Hepatica. There are but two species, H. nobilis, P. MILLER, 1768 (better known as H. triloba, GILIBERT, 1782), and H. transylvanica. Of the common Hepatica, Dr. Beck enumerates no fewer than twenty varieties and forms as follows:—hispanica, tricolor, plena, Barlowi, superba, vulgaris, rubra, carminea, carminea plena, alba, alba plena, calycina, steleantha, marmorata, cuprea, minor, rhotica acutiloba and obtusa. These variations depend on minor differences in the leaves or in the flowers. Under H. transylvanica, Il. angulosa is quoted as a synonym. In addition, a hybrid between the two species, H. media × is enumerated.

"A BEAUTIFUL WORLD."—The sixth number of this little pamphlet appears this month; the last was issued a year ago. It is the organ of the Society for Checking the Abuses of Public Advertising. This Society justly contends that individuals have no right to ruin natural beauties intended for the enjoyment of all by setting up objectionable and unsightly advertisements. Mr. Crackanthorf, Q.C., in a speech reported in this pamphlet, suggests that, with a view towards influencing their future decisious children should be taught alliterative lines the reverse of complimentary to obtrusive advertisers and their wares. How the young idea would receive such variations of "Peter Piper" and similar old friends, remains to be proved; possibly the speaker did no mean his suggestion to be taken seriously.

"THE ENGLISH ILLUSTRATED MAGAZINE."—The Christmas number of this publication is a thick and handsome one, containing over 400 pages, and profusely illustrated. Those who like fiction will find plenty to amuse them here, as well as more serious articles upon "Impressions of Constantinople," by Melton Prior; "Our Great Naval Hero," by Clark Russell; "The Maid of Orleans," by Andrew Lang; "Campaigning in the Soudan," by H. C. Septings Weight; and other subjects.

"ORCHIDS AND CYRTANDRADS OF THE MALAY PENINSULA."-Botanists and Orchid-lovers will hail with acclamation the publication in the thirty-second volume of the Journal of the Linnean Society of Mr. RIDLEY's paper on this subject. It contains a classified enumeration of the species met with in the Malay l'eninsula and the adjacent islands, from latitude 7° North to Singapore. Much of the country is stated still to be unknown botanically, so that important discoveries may be expected in the future. The technical details are interspersed with numerons observations on the life-history of the plants. It is unfortunate that several of Mr. Ridley's new species could not have been inserted in Sir Joseph Hooker's Flora of British India. In the same volume is a monograph also by Mr. RIDLEY, of the Cyrtandraceæ of Malaya. The immber of species in the Flora of British India is stated to be very small in comparison with the number since brought to light from the hill-districts of the interior formerly inaccessible; whilst the plants are so local that every hill-range may be expected to produce new kinds.

MISSOURI BOTANICAL GARDEN—The seventh annual Report of the Missouri Botanical Garden contains, not merely a review of past work and present conditions of the institution, but important papers on the following subjects: "Juglandacca of the United States," by William Prilease; "Study of the Agaves of the United States," by A. ISABEL MULFORD; and "The Ligulate Wolffias of the

United States," by Charles Henry Thompson. We may mention that the Report is brought out well, printed on good paper, and illustrated with many plates, which add much to the attractions of a hand-some volume, and ensure its permanent utility.

THE SURVEYORS' INSTITUTION. — The next ordinary general meeting will be held on Monday, December 7, when the adjourned discussion on the paper read by Mr. Walter C. Ryde (Associate), at the last meeting, on "The Agricultural Rates Act, 1896," will be resumed; and (should time permit) a paper will be read by Mr. C. H. Hooper (Fellow), entitled, "Fruit Growing as an Auxiliary to Agriculture." The chair to be taken at 8 o'clock. All inquiries with reference to the junior meetings should be addressed to Mr. A. NORMAN GARRARD, 8, Frederick's Place, Old Jewry, E.C.

MASONIC HONOURS IN THE TRADE.—On the 25th ult., Mr. J. GREEN of the Dereham Nurseries, was installed worshipful master of the Sendes Lodge, No. 996, in the Freemasons Ilall, at Dereham. Subsequently a banquet was held under the presidency of the newly-installed worshipful master, who appears to be very popular among his neighbours.

Royal Jubilee; Egremont Russet, Sandringham, Stirling Castle, Striped Beefing, Tyler's Kernel, Warner's King, Wellington, and Williams' Favourite, shown here so well sustain the size and character of the illustrations of these new and promising varieties, and iuspire the public with confidence in the new dessert Apple to be distributed next year, Lincoln Allington Pippin is said to be a cross between Cox's Orange and King of the Pippins, and is perhaps the finest dessert Apple that has been introduced since the advent of this fine standard variety. Mr. John Watkins, of the Pomona Farm Nurseries, Withington, Hereford, is also offering his new Apple, Byford Wonder, yet another addition to the full class of good culinary Apples; and Lord Hindlip, yet another fine dessert Apple, to follow Cox's Orange Pippin.

The last-named grower also made an interesting display of perry and eider made from his own fruit-orchards. He grows a capital collection of Apples and Pears for those purposes, as well as one of the finest for garden orchards and market purposes. On this occasion Hereford rather had the lead of Kent, alike in colour and size, while the market-growers were still further ahead of the private growers, either north or south

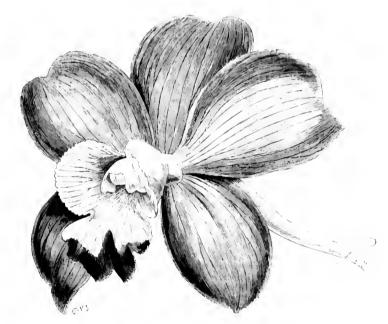

Fig. 122.— SOPIRO CYPTLEYY — CYLYPSO.
Sepals and petals rosy-purple; lip rosesoringe, front of the hp rich purple

SWANSEA HORTICULTURAL ASSOCIATION.—
Under the auspices of the Swansea and District Horticultural and Gardeners' Association, Mr. W. W.
Pettigrew, Superintendent of the Parks and Open Spaces, Cardiff, delivered a very interesting lecture on "The Process of Fertilisation" at the Public Library on Thursday Evening, November 19. Mr. W. S.
Gileert, The Gardens, Bablan Hall, will deliver the next lecture on December 17, subject, "Chrysanthemums and their Culture."

FRUIT AT EDINBURGH.

Some of the more choice Apples shown by Mr. Bunyard at the Edinburgh Chrysanthemum show, November 19 to 21, 1896, were —Aunie Elizabeth, Beauty of Kent, Bismarck, Blenheim Orange, Byford Wonder, Mank's Codlin, Ecklinville Seedling, Emperor Alexander, Gascoigne's Scedling, Golden Noble, Golden Spire, Hambling Seedling, Lady Henniker, Lane's Prince Albert, Lord Grosvenor, Môre de Mônage, Newton Wonder, Peasgood's Nonsuch, Mabbott's, and Hubbard's Pearmains: Pippins — Cockle, Cox's Orange, King of the Pippius, Ribston: Reinettes—Baumann's Red Winter, Du Canada, and

TREES AND SHRUBS.

CERCIS SHLIQUASTRUM.

THE Judas-tree is a very ornamental subject while in bloom, the deep pinkish-red flowers clustering up the stems on the old and young wood, and this year I saw flowers produced from buds formed on the bale of the tree, the girth of which was 22 inches in circumference. The foliage also is distinct, and follows the flowering period. In the sonth of England it grows freely as a standard, attaining a height of 20 to 30 feet, but in colder latitudes it requires the shelter of a wall. In the south-west of England it flourishes, and this year it has produced seed-pods clustering on the stems as thickly as the leaves. A tree I saw in the gardens of Linden House, the seat of S. Fox. Esq, near Wellington, a few weeks since, was quite a feature in the grounds, by reason of the crimson red colouring of the seed-vessels, for although most of the foliage had fallen, the tree had the appearance of being clothed with crimson leaves, and not until forming a clo-er acquaintance with it could one discern the fact that the rich colouring was

due to the numerous seed-pods. These were so bright that it cansed the tree to be a conspicuous object seen at a considerable distance. Where planting is contemplated, the present is a suitable time for carrying out this operation. Plants may be easily raised from seeds sown in spring in slight bottom-heat.

EUCALYPTUS COCCIFERA.

This species fleurishes in a remarkable degree at Powderham Castle in Devenshire, and a tree there has now attained to considerable size. It is at the present time covered with seed-vessels which, when bruised, emit a strong seent. The bols of this tree measures over 12 feet in circumference at 5 feet up. In recent years the main branches have produced a profusion of laterals which give the tree a denser appearance than it formerly possessed. C. H.

SOPHRO-CATTLEYA \times CALYPSO.

(Sophronitis grandițlora ? , Cattleya Loddigesii var. Harrisonia & .)

At the meeting of the Royal Horticultural Society, November 24, one of the most remarkable flowers placed before the Orchid Committee out of the group of rare Orchids exhibited by Baron Sir II. Schroder, The Dell, Egham (gr., Mr. H. Ballantine), was the remarkable Sophro - Cattleya . Calypso, which was rai-ed by Messrs, Jas. Veitch & Sons, and first flowered in 1890. Reference to our illustration (fig. 122) will serve to give a good idea of the change brought about by this singular cross. It will be seen that the flower in form and size partakes much of Cattleya Harrisoniæ, and it is similar to that species in the firm substance of the sepals and petals, which are rose-purple in colour, with a number of very fine darker purple lines, and a slight orangecoloured tint. The labellum is rich orange colour, with a slight veining of purple running from the base to the dark crimson-purple band which runs round the front of the middle lobe. It is a remarkably pretty hybrid, and very distinct from any other Sophro-Cattleya. Unfortunately, it is a very rare plant, and likely to continue so.

HOME CORRESPONDENCE.

A HORTICULTURAL INSTITUTE,—My contribu-tion to the Gardeners' Chroniels of November 21 was not intended to put forward the Royal Aquarium as the most suitable place in which to hold a flowershow; rather my desire was to give some idea of the requirements as to space of such a large exhibi-tion as that of the Jubilee celebration of the National Chrysanthemum Society, and to compare them with the imagined size of the proposed horticultural institute or hall. Neither the policy of the National Chrysanthenrum Society, nor the fitness of the Royal Aquarium (excepting in respect of the size of the latter, is now under notice, and these two matters may be safely left in the hands of the committee of that society, who can be depended on to know their own business best. The proposals to erect a horti-cultural lustitute is intinately connected with the provision of a hall in which to hold exhibitions. provision of a half in which to hold exhibitions. Supposing a half of the dimensions of the Drill Half at Westminster could be provided, necessary offices would be required, especially if they are to afford the facilities suggested by Mr. Wood, and the cost would be enormous. I should estimate the provision of a freehold-for such a building should be freehold, and the erection of the necessary buildings and furnishing the same, would cost not less than £60,000. How is this sum to be obtained! sidering such a proposal, the experience of those who have had to do with large horticultural exhibitions in London is of service in correcting the easy flights of imagination of those who have not enjoyed this advantage. In my last communication I stated that 1200 plates were required to stage the fruit, &c., at the recent Jubilee exhibition. Allowing I foot square for each plate, they would require for staging 400 feet run of 3-feet tabling, or eight tables of 50 feet lengths. Now let anyone cal-culate the space they would have remaining for other exhibits after they had arranged in the Drill Hall. eight tables of 50 feet by 3 feet; saying nothing about

alleys for locomotion. It is by such a practical illustration as this that the requirements of a hall to accommodate an ordinary exhibition, can be approximately estimated; and then, if the show were well attended, such attendances, for instance, as we experienced at the Royal Aquarium, the strictest police regulations would be required to keep the company moving and always in one direction. What that means is well known to hose who have had such experiences. When we get a well-thought-out plan before us, such as that Mr. Wood appears to have in his pocket, then we shall be in a position to estimate its value and practicability. I shall be very much surprised if even the enthusiasm that the celebration of the sixtieth year of Her Majesty's reign will evoke on the part of horticulturists, and those in sympathy with its progress, will possess sufficient vitality and force to provide a Hortfeultural Institute. R. Dean.

- I have carefully considered the suggestion advanced in the Gardeners' Chronicle and elsewhere of making an Institute for the Horticulture of the United Kingdom, a memorial of the Queen's reign; and also the plan of inviting the Royal Botanical and Horticultural Societies of London to make a combined effort to earry this scheme into practical effect; and would like to add here and now, that I approve of the place selected, and of the means proposed to establish it. As to the place, during last summer I paid two visits to the Botanic Gardens in the Regent's Park, and was most favourably impressed with the beauty and resources of the site, merit of the trees, shrubs, &c. The semi-private area and resources of the Botamcal Society might prove ample for a Horticultural Institute worthy of its dual aspect, the lasting memorial of the benignant reign of the Queen, and of the national appreciation of horticulture. Were it even necessary in pursuit of these objects to deal with yet larger areas, part of the Regent's Park, without ceasing to be public, might be made to constitute to the beauty or resources of the Royal Memorial Home. Such a home might give forcible expression to the loyalty, as well as enhance the pleasures and comforts of all classes and conditions of men, and become a powerful instrument in the growth of culture and the advancement of science. D. T. F.

- I fear where so eminent a financier as Baron Schroder failed, even the enthusiasm of Mr. Wood may not succeed. Sentiment, however desirable and pleasing, hardly enters into such a subject, which is absolutely one of ways and means. Even if the fullest wealth were at disposal, sites are so few and so eostly that there would be little chance of any scheme, however humble it might be, being carried out. Any institute such as is suggested, and even needed, to serve its purpose, must be central. It is of little use to discuss sites or positions difficult of access, or that are not near the centre of London. The finest site in London now is that covered by the Royal Aquarium, and if a Horticultural Hall Company, with a capital of some £300,000, could be floated to purchase this building and site, convert it into what it was originally intended to be—a great winter garden, replace the present roof with one of glass, remove all centre obstructions and side shows, let the sides for horticultural purposes, and the galleries for similar purposes, and convert the whole of the remaining area into a grand floral promenade, with good music, we should then have such a horticultural hall and home as is needed; but no one would for one moment suppose that such a place would pay. We could not have Temple and Chrysanthemum shows, or even Rose and Dahlia shows always on, and by far the greater portion of the year the place would be unused. Any smaller place would be useless. That being so, where can be found better accommodation for the Royal Horticultural Society than it at present enjoys, and which it is singularly fortunate to possess. To creek a hall, even of the dimensions of the Drill Hall, on any central site, would be enormously costly, and when built would be useless for big exhibitions. A. D.

— Will you kindly allow me space for a few remarks upon the matter of celebrating the sixticth year of Her Majesty's reign. Mr. Wood, of Oakleigh Park, Whetstone, has hit upon a capital idea in suggesting a "home" of horticulture. It gives all lovers of flowers an opportunity of contributing towards a matter of such national importance. When we look at the magnitude of horticultural exhibitions (the National Chrysanthemum Jubilee Show for instance), cramped up in such an unsuitable building as the Aquarium, naturally one thinks it must be to the great disadvantage of flowers, judges, and exhibitors. We want a building with various

halls, where exhibitions could be seen at their best. Now, in connection with such shows and exhibitions, we know that hundreds of gardeners come from long distances, who, if they want to see a two or three days' show, must put up in hotels or similar expensive quarters; and such outlay can be ill afforded by most gardeners, whose salaries, I may say, are not at all in keeping with the amount of responsibility placed upon them. I throw out the suggestion that in connection with such an institute there should be a sort of temperance hotel or boarding-house, where gardeners visiting London shows, gardens, &c., could be lodged and fed at reasonable charges. I will gladly give my help towards the matter. J. D. Robertson, F.R.H.S.

THE DEODAR AS A TIMBER-TREE.- According to a contemporary this week, Mr. Nicholson of Kew describes the Deodar (Cedrus Deodara) to be "a failure generally" in this country. I consider this a very extraordinary statement, from such a source, and a very incorrect one as well, because 1 never heard of the tree failing anywhere on a dry bottom; while I feel sure, from certain characteristies of the tree, that it would make a first-class timber-tree in this country under plantation-culture. How, moreover, does Mr. Nicholson reconcile his present statement with the description in his own Dictionary, where, by an asterisk, the Deodar is Veitch places it in the highest rank, "its value," he says, "being greatly enhanced by the readiness with which it accommodates itself to almost all situations. What do your readers say! The question involved in your contemporary, and upon which Mr. Nicholson's opinion is cited, is the value of the Deodar as a timber-tree. Will Mr. Nicholson, or anyone else, state where it has failed under plantation culture, or where it has been tried? or if he knows of any timber-tree in this country that will live as an isolated specimen and not succeed as a plantation timber-I do know species that will succeed inside of a plantation that will not thrive where individually xposed to the winds. Here we have some of the oldest Deodars in the country in situations ranging from about 350 feet above the sea, to nearly 200 feet, and on very exposed north-eastern positions. J. Simpson, Wortley.

OLEARIA HAASTII. - This is likely to prove is useful and attractive in the summer, as the Laurustinus has so long been in winter and spring. The plants so recoutly illustrated and well described, grown in the Botanic Gardens, Edinburgh, were amongst the most attractive features of that popular resort for culture and pleasure, and I was glad to note that the nurserymen are getting up a nice stock of this charming hardy shrub. It was therefore all the more gratifying to have "W. H. A." assure all the readers of the Gardeners' Chronicle lately that this is likely to prove one of the most valuable as well as bright and beautiful shrubs, for growing in crowded towns, as it seems unsuitable to the soot and the dust. Certain it is that no plants can look healthier than those seen about Edinburgh, though Leith fogs are added to the other impurities and drawbacks named. It is a good idea of "W. H. A." to associate the Olearia with such useful and striking hardy plants as the Japanese Enonymuses, the best silver and golden species and varieties, such as Silver Gem, latifolia aureo-marginate, l. a. pieta, and argenteo-marginata, &e., would contrast mildly, and go well with the verdure of the foliage, and whiteness of the bloom of the Olearia Haasti. P. T. F.

LIQUID MANURE FOR FRUIT TREES. - In summer time manure in a liquid form applied to the roots of fruit-bearing trees, when given in sufficient quantities to thoroughly moisten the land to a good depth, is a very effective means of affording help to the trees, and the results are soon observable. it may happen in a dry season that the coil is very dry, consequently impervious to water to any great depth, and in this case the manure-water would do little or no good. The ground should first be well moistened by repeated applications of water, the entrance of which into the soil should be helped by the use of the crowbar or pick, and when it is found that the soil has been moistened to a good depth, the manure-water may be applied. In the winter this preparation is searcely ever needed, and manure may be afforded without it. It may also be used at that season at thrice the strength of summer waterings. If farmyard liquid-manure cannot be obtained, then use the contents of cesspools, the drainings from hotbeds, dung-heaps, as all these forms of plant-food do good. Only a few years ago I had the ground round several aged fruit trees standing in the gardens saturated in late autumn, with very great benefit to the trees, the fruits the next year being larger, and the leaves and wood considerably stronger than for some years previously. The land where trees have been recently planted absorbs water readily, and no preparation of the soil is called for. Apple, Pear, Plum, and Cherry trees should all be served alike where it is believed the soil has become exhausted, and unless the trees are afforded some stimulus to growth they fail to do much good, and the lighter the soil, the sooner the mischief becomes apparent. H. Murkham, Mreworth Castle.

VICTORIA REGIA.—It may perhaps interest some of your readers to hear that my Victoria Regia here is still in full bloom, and with every prospect of continuing to flower (as in some favourable previous years) till the middle of December. It has now two fine buds ready to open as soon as the flower in bloom, with its bright rose-coloured centre, fades away and sinks under water. We have had an uninterrupted series of bloom since the end of May 1. Dixon, Cherkley Court, Leatherhead.

SPORT FROM CHRYSANTHEMUM MADAME CARNOT.—I herewith beg to send you a yellow bloom from a plant of the variety Madame Carnot. About a week ago it was perfect.—I notice Mr. Wells has shown one of the same colour, and I hope we may be able to fix the sport, for I should consider it one of the best in its class. Kindly tell me what you think of it. Frank Lowe, Easthampstead Park, Wokingham.—A large characteristic bloom of this fine variety, but the colour, instead of white, is eanary-yellow. Eo.

NEW CHRYSANTHEMUMS.—The paper by Mr. C. E. Pearson on the above subject on p. 666 of the Gordoners' Chronicle, is interesting, if only because it goes to prove the different behaviour of certain varieties in various localities. Very high praise is bestowed on Australian Gold and Modestum. the group of plants referred to at the Drill Hall of Australian Gold, and I certainly did not receive the same impression respecting it as did Mr. Pearson. Nor am I alone in this, as two leading Chrysanthemum specialists at the same moment declared " they did not care for it." From a cultural point of view, the 5-inch pot plants were satisfactory, but Australian Gold is disappointing in colour. Indeed, it is difficult at night to know whether it is yellow or dirty white. |The plants shown by Mr. Wells had been hurried by an increased temperature, and the flowers were not characteristic in colour. Instead of the pale lemon there seen, the blooms should be light golden-yellow.] Modestum is grand in colonr. if not absolutely unique, though, so far as I have seen, the blooms are rather small. Then on the other side, it is curious to note, among others, that Mr. Slogrove has "disappointed most buyers. Those who have been disappointed with it, I would like to ask whether they have trusted to the "crown" bud / if so, I am not surprised, as my experience is that it, the terminal bud, is decidedly better; at any rate, this variety was exhibited in splendid condition November, 1895, and I have had at the end of splendid blooms from terminal buds this year. In respect of such new varieties, however, more experience is required, for doubtless the stock was hard-Many varieties, I feel sure, are discarded before their merits have been fully tested, because they possess some requirements not readily understood by the cultivator, or it may be that one particular season is unfavourable to them. Then, of course, the ever-increasing number of novelties tends to induce a too hasty decision. One word more-ls it not time that some special classes were created by all leading societies for blooms to be shown with 18 inches of stem, without support of any kind, in order to discourage weak-necked varieties? What is wanted are flowers on a self-supporting pedestalflowers of the Lord Brooke type, that hold their heads erect unaided. Unfortunately, the majority of the best flowers of to-day are useless without these

LAPAGERIAS FRUITING.—The fruiting of the Lapageria at Straffan House, co. Kildare, so graphically described and illustrated on p. 657 of last week's Gardeners' Chronicle by Mr. F. W. Burbidge, is, as you there remark, "not very uncommon;" still, it is very interesting to hear that it is fruiting so freely at Straffan, and there is every probability that the seeds will prove fertile, if they were fully ripe when gathered. It is exactly forty years since that I had

the care of a large old plant of Lapageria rosea at Porter's Park, Shenley, Herts, which bore several fruits that season (1856-57), and the same plant was said to have fruited in previous years. That plant was also reputed to be the first Lapageria introduced to Britain, and had been in possession of the owner of the place, "Squire" Myers, for "many years." The account of it was this:—Mr. Myers was a Liverpool ship-owner, whose vessels traded to the west coast of South America, and being a lover of rare plants, his captains were instructed to bring home live specimens of any rare or fine plants they met with in the countries they visited. One of them brought the fine plant referred to from southern Chili to Liverpool, where it was grown for some years in Mr. Myers' garden before it was removed, early in the fifties, to Porter's Park, on Mr. Myers acquiring that estate and making a new garden. The plant grew in a tub about 20 inches in diameter, and although it had not received the best of treatment, according to our present knowledge, it flowered freely, and set the few froit mentioned without any artificial aid. The fruits swelled to their full size, but were not ripe when I gave up charge of the plant early in 1857, and what Somewhat fabulous sums were said to have been offered for the plant, but the "Squire" preferred to keep it. Since that time I have often seen its fruit, and have raised plants from the seeds. Some of the seedlings have better flowers than the parent, while others are worse; a result that may be looked for in a subject so ready to break into variety as the The white variety, Lapageria rosea alba, introduced also from Chili in 1851, fruits as freely as the type. At Valleyfield House, Midlothian, both varieties have been very successfully cultivated for many years by W. Cowan, Esq. Some years ago he raised a batch of seedlings of the white variety, which have produced as fine pure white flowers as their parent. The raising of plants from seed is, however, rather a slow process; and those who desire immediate results, should begin with strong well-rooted plants with several stout shoots. I believe it was Bill Lobb, not Tom, as stated on p. 657, who collected plants on the west coast of South America in the forties and fifties for Messrs. Veitch & Sons, and introduced the Lapagerias, as well as Philesia buxifolia, and numerous other fine things from those regions to our gardens through that eminent firm. M. D.

Referring to Mr. Burbidge's remarks in the thurdency's Chronicle for Saturday last anent the fruiting of the Lapageria, I may say that between the year 1882 and Jubilee year a plant of L. rosea in the Botanic Gardens, Manchester, fruited and perfected seeds on three occasions. Some of these seeds were sown in pans of sandy peat, which was kept moist, and in due time nearly every seed germinated. It is important that the seeds be sown as soon as ripe, as I have found if kept dry for any length of time they lose their vitality. I am told that plants of Lapagerias raised from seed produce blossoms inferior to those borne on the same plant from which the seed was taken; and that the only way to perpetuate a good variety is by raising young plants from layers. Whether this is so or not, I am, from my own experience, unable to say, but it would be interesting to have the opinion of those who have raised and flowered seedlings of this excellent coolhouse twiner. T. N. R.

— The fruiting of this plant, as mentioned in last week's issue of Gardeners' Chroniele by Mr. Burbidge, is by no means uncommon where grown extensively under glass. When living at Nash Court, Faversham, some years ago, the home of the Nash Court variety of Lapageria rosea, and where I suppose the plants are grown as well as they are anywhere, I can well remember when pruning the plants finding quite a quantity of well-seeded fruits, some of which had ripened to perfection. I suppose there is no flower which bees and wasps visit more frequently than that of Lapageria rosea, which affords a reason for the fertilisation of the flower. I have quite recently raised some plants from seed, but propagation by means of seed is not so rapid as by means of layers; neither do seedlings flower so well as layers. G. Burrows, Berwick Gardens, Shrewsbury.

CETERACH OFFICINARUM.—As an addendum to the extraordinary vitality of this Fern, so skilfully depicted by Mr. Chas. L. Druery in your issue of last week, it may be of interest to give an instance as supplied to me by that well-known gardener of Viola faine, Mr. Baxter, Daldowie House, Broomhouse, N.B., when paying him a visit a few weeks ago. Mr. B. is now sixty-five years old, and has been

gardener at Daldowie for thirty-seven years. In a cool frame was shown me a small plant of this variety, growing from the sides of the frame between the brickwork, presumably having seeded from a plant that was growing in a pot alongside some thirty-five years ago. This pot, in due course, was removed, and about ten years ago a tiny s-edling was observed protruding from the interstices of the aforesaid brickwork. Mr. Baxter supplies a very feasible explanation (which in no way can discount the great vitality of the seed) in this wise:—The sides of the frame have been pointed with lime from time to time, until of late years it has been allowed to moulder away—jocularly adding: "In order that the very frames might be in keeping with its surroundings, as Daldowie House has been in existence 200 years." Albert Upstone.

WOLVERHAMPTON CHRYSANTHEMUM SHOW.—In your report of this show on p. 604, it is stated that a Certificate of Merit was awarded to Messrs. T. B. Dobbs & Co., nnrserymen, Wolverhampton. The committee, while indebted for the otherwise good report, wish me to state that no Certificate of Merit was awarded to any exhibitor at this show. Geo. A. Bishop, Chairman. [Our correspondent appears to have described as a "Certificate of Merit" merely a complimentary award made to several honorary exhibitors. Eo.]

ASPARAGUS DECUMBENS.—As a plant to grow in a basket for the embellishment of a warm conservatory, Asparagus deembbens is peculiarly adapted, with its very long and gracefully drooping growths of a rich green colour. I find its long growths very useful for a variety of purposes, including bouquets. The plant thrives in light sandy loam, and a plentiful supply of moisture at the roots during the growing season. To make an effective display in a short space of time, several roots or plants should be planted if the basket is a large one. H. May, Markree Castle tiaxidens, Collomey, co. Slipa.

CEPHALOTAXUS PEDUNCULATA.—From Weston Park, Steyning, the Rev. L. Goring has forwarded to me fruiting branches from several specimens of the above, which conclusively prove that as regards shape of fruit this is a very variable species. with round or spherical berries, C. pedunculata spheralis, Masters (see Gardenevs' Chronicle, January 26, 1884 p. 117, fig. 23), is one of the most distinct and remarkable, and is justly entitled to the name that has been bestowed upon it. In northern Ireland I have seen a tree bearing fruit in every respect similar to that of the Weston Park specimens, thus proving that the variety is constant and widely distributed. There are, however, intermediate forms, in so far as shape of fruit is concerned between the typical species, in which the berries are decidedly of oval shape, and the variety spheralis which bears round or spherical fruit. Another very curious form has just been sent to me in which the unusually small berries are of a clear yellow when ripe, at which stage thoy greatly resemble the small Californian Grapes that have been sent into this country in such quantities during the past summer. A. D. Webster.

HOME-GROWN AND AMERICAN FRUIT.—Vour correspondent, "A. D.," p. 654, does well to call attention to the rough manner in which English fruit is often sent to market, but in so doing there is no need, I think, to throw cold water upon Lord Winchilsea's scheme for giving a lift to the depression in British agriculture, for, if the movement be carried out on the lines laid down by the promoters, and is sup-ported by producers and consumers alike in a manner worthy of a national movement, it ought to benefit the agricultural community, and through them the country generally. As it seems that the small byproducts of the farm are the most neglected, such as eggs and poultry, dairy produce, fruit, flowers, and vegetables, the creation of a good ready-money market, where goods can be sold at a fair price, is something worth striving for, and in time the farmer will find out that careful sorting and good packing pay, and that London only wants the best of everything, and will pay for it. The extract from the Westminster Ga_cttc hardly reads like a communication from Winehilsea House; they have too practical a staff to despise the contributions of our American and Canadian cousins; and on the subject of patriotism, it is well to provide for our own household honestly. I think the Liucolu Board of Guardians were doing their duty in getting the best value for public money; but there is also another kind of patriotism, which teaches our own countrymen to meet their own requirements. R. M., Newbury.

CYCLAMENS NOT OPENING THEIR FLOWERS -As my Cyclamens which will not expand their blooms appeared to have called out the interest of some readers, I send you herewith a sample of the plants. I have one hundred and twenty-five, of which the specimens sent are fair samples. I have also five or six smaller plants which are behindhand; they are one-year-old plants in 48-pots, as you see. Seed was sown in November last in a temperature of about 73°, and after being closely examined by mice, and finally rejected by them, it germinated, and the seedlings were potted into "thumbs," and placed in cold Tomato-houses, with plenty of shade and air. They were repotted on August 8, in the following kind of mixture, carefully mixed and sifted :-One part new yellow turfy loam, one of peat, one of decayed mannre, and one soil from the rubbish heap, which consisted of decayed vegetable refuse, old potting-soil, with Spircea, Fern, and other sandy soil, and exhausted mannre mulching materials, which formed a rich friable compost. The plants grew well after potting, but if any mistake has been made it has been through keeping them not moist enough. They had no artificial heat till October 12, when they were put into a house at about 60. As the soil was rich and fertile, we have not supplied any further feeding. Acting on the advice received through your journal, I have removed the plants from off inverted pots to a moist ash-hed, with a temperature of 54°; and as I had no farm-yard manure handy, they were watered on Monday, November 16, with sulphate of ammenia in the proportion of 1 oz. of sulphate to 3 gallons of rain-water. This has certainly helped the plants, but the buds have not opened so fast as I expected, only one or two having expanded. Since reading the letter in the Gardeners' Chronicle from "J.," I have had another good look at the plants, and find that the buils of one plant are certainly deformed, but, strange to say, that plant was the first to open its flowers, and has continued to be pioneer in that The others do not appear to me to be at all irregular, but are all well-shaped, and properly folded in their calyce. No doubt you will be able to cannot coneent to consider the bloom lost for this There may be some treatment which will bring the buls out. I am of opinion that whatever check they may have received through faulty watering or heating, it has not irreparably damaged them, and I await an expression of your opinion; meanwhile I shall endeavour to encourage the buds to open by stimulating periodically with weak liquid-manure, adding soot as recommended by "J." C. B. W. [The blooms, which are numerous on the two plants sent, and the foliage, are to all appearance normal, the former numerous, but disinclined to rise above the leaves, deformed here and there, but as a whole perfect; the latter is fleshy, robust, fully deve-loped, and well-marbled. The compost in which loped, and well-marbled. The compost in which they have been potted seemed abnormally light and spongy, holding water like a sponge, rich in feeding matter, but very liable to become water-logged, or rather to hold more water amongst its particles than is good for the plants, unless afforded water with the utmost care. A plant kept afforded water with the utmost care. A plant kept in the dry air of our office for a week, and then transferred to a window in a kitchen always in use, is not as yet ten days after it was sent from nursery) in need of water, although the weight of the pot and its contents has got sensibly lighter. Ep.J

CATTLEYA LABIATA VENOSA.—In reference to the note on this variety, in Gardeners' Chronicle of the 14th ult., I beg to say that I have a Cattleya labiata which has bloomed three seasons, and it has always had the striping all over it. The plant is now in bud, and when it comes into bloom, I will let you know whether the striping has become constant. Hans Brochner, Hessle, East Yorkshire.

CHRYSANTHEMUM BEAUTY OF TEIGNMOUTH AND C. PRIDE OF MADFORD.—On p. 632 of Gardeners' Chronicle Mr. Wells makes an attempt to set us right in respect to these varieties, but 1 fail to find that he has thrown much light on the subject. Mr. Wells says he would like to give the history of Pride of Madford and James Lynch, and then informs us these two varieties were sent to Mr. Salter "both named Pride of Madford, but were found to be dead on arrival." This does not take us very far; but how does Mr. Wells know that both were Pride of Madford, though one was named J. Lynch, if both were dead! Mr. Wells then says of Beauty of Teignmonth, "I know its history. I introduced it, and was awarded the First-class Certificate on Oct. 21 for

Pride of Madford syn. Beauty of Teignmouth." Now this is hardly correct. Mr. Wells did not introduce it, for it was exhibited several times in the year 1894, and certificated by the Royal Horticultural Society in October, 1895, the same variety having been certificated by this Society a fortnight previously as Pride of Madford. Mr. Wells informs us that he can tell us the history of Beauty of Teignmouth, also that this and Pride of Madford are the same; yet in his Catalogue of last year only the former is mentioned, and in that of this season's it is described as "rich purple, lilac reverse:" whilst Pride of Madford is described as "crimson-cerise, white reverse," quite a different colour, all must admit. Messrs. Hannaford now inform me that when they first received the plants, the writing on the labels was not legible. They therefore called the best of the batch Beauty of Teignmouth, which should have been Pride of Madford, and for Pride of Madford sent out the variety now grown as Jas. Lynch. Mr. Wells says Messrs. Hannaford must be credited with Oceana and Australie. These were introduced by Messrs. Cannell. Whilst I have the pen in my hand, I would like to ask the readers of the Gardeners' Chronicle what is their opinien of Win. Slogrove? It was certificated by the National Chrysanthemum Society last season as a new variety; with myself and many others, it is identical with Thos. Sellwood, an improved Lincoln. IV. J. Godfrey, Exmouth.

TRAPS in GARDEN WALKS, ETC.—No one who has used the pot-trap or gully would go to the expense of building brick ones, which are now obsolete, as all the principal road contractors use the pot-gully, which has several advantages: it is easily fixed, easily cleaned, and cheaper, and they are to be obtained in snitable sizes. In laying drains near large trees, and especially Elms, it is always advisable to use socket-pipes with cement joints, in order to prevent the roots getting into the pipes and blocking them. It is much better to incur a little extra expense when doing the work than to put down ordinary pipes near trees, which are sure to be always a source of trouble; a good system of draining roads and paths is very essential, whereas a deficient one causes frequent trouble and annoyance, as nothing spoils the appearance of a place more than to be continually pulling up the drains. W. B. G.

THE AGRICULTURAL RATES ACT. 1896 .- I have read with much interest your notes on this Act. In the Worthing Case (18 Q. B. D. 818) it was held that land occupied by a market gardeuer, and covered by glasshouses built on brick foundations, came within the words "market gardens," as used in sectiou 211 of the Public Health Act, 1875, and that the glass-houses were to be assessed under the section in onefourth only of the net annual value. The Agricultural Rates Act, 1896, defines agricultural land having the benefit of the Act is meaning, amongst other things, "market gardens." The Queen's Bench has said glasshouses for trade are "market gardens" under the Act of 1875. When the legislature, in the Act of 1896, exempted "market gardeus" from half the rates, it had knowledge that "glasshouses" had been judicially interpreted as "market gardens," and, therefore, the presumption is that Parliament intended that glasshouses for trade purposes should come within the scope of the Act. Surveyors of taxes are contending that these glasshouses are buildings within the meaning of the Act, and should therefore be treated as buildings on farms, and liable to full rates. But is there not this distinction? Glass-houses are for the purpose of producing or growing the crops, farm buildings for the purpose of storing, &c., after production. Stables, potting-houses, packing-sheds, and chambers for storing fruit in market-gardens are more of this nature, and no doubt liable to full rates; but not so the glass-houses. It seems that a grave responsibility lies on overseers of the poor. No one can appeal against the decision of the Assessment Committee except the surveyor of taxes and the overseers (sec. 6). Now, in districts where the Assessment Committees hold that "glass-houses" are not market-gardens within the Act, and overseers do not appeal, will not this be the possible result? Under sec. 4 of the Act, the Local Government Board shall ascertain at once the amount of the annual grant. If the Assessment Committee's list sent to the Local Government Board excludes glasshouses from the Act, the Treasury will not make any grant in respect of them. In April next, when the first rate is made, the overseers will demand from the occupier of glass-houses the full rate. He will refuse to pay, on the ground that they are market-gardens. The Court may (pro-

bably will) decide in his favour. The overseers will only receive half the rates from the occupier. They will be too late to obtain the grant in respect of them from the treasury. What will be the result? The parish will lose it. Does it not seem that overseers will do well to consider this position? A Fruit Grower and Member of an Assessment Committee. [See p. 692.]

ODONTOGLOSSUM × HALLI ? CRISPUM COOKSONIANUM &.—Long though it is, that is the name of the plant whose whole spike is before me, through the kindness of Norman C. Cookson, Esq., the lucky owner of the first "crispum" hybrid. He and his energetic gardener, Wm. Murray, have beaten all competitors and bloomed their plant. The plant has but two bulbs, and bore a three-flowered raceme, and, as already announced, it was awarded a First-class Certificate at the Royal Horticultural Society on Nov. 24, 1896. With a dried (1896) bloom of its father, and another of a good Od. Halli leucoglossum before me, it is easy to see how very intermediate is the "child." except that its lip is not white. The ground colour is white, slightly yellowish in the petals, more so in the sepals, and the yellow of Od. Halli has run into the lip, the deep crimson-brown blotches and spots have a shading of the dull blackish shade that characterises Od, Halli. The arrangement of the blotches agrees to it also, especially in the lip, which is oblong, $1\frac{1}{4} \times \frac{7}{4}$, a very massive feature, and less fimbriate than Halli, having larger rich rows of spots than a "crispun"

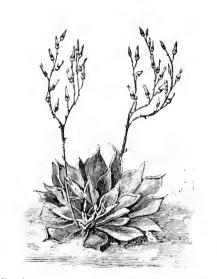

Fig. 123 - Coheverty purpusi: leaves snow white, Mealy? Flowers grange, (Much reduced)

usually has. The crest is that of a true Halli, except that the two large "teeth" are less fimbriated than in that species. The anther, cup, and rings are brown, here also inclining to the "mother" parent. Size at present is that of a good Od. Halli, broader in all its parts. Size and length of cornu will be much improved. The plant in all ways was an elongated crispum, plainly showing that "sheeny" and alternated shape of Halli. In fine, Mr. Cookson is to be heartily congratulated. No doubt his success will greatly stimulate others. dc R. Crawshay.

by post a short time ago a few Eucharis leaves for your inspection, the bulbs of which were planted out three years ago all round the sides of the paths against the back wall of the stove at Hewitt Grange, Bromsgrove. The border is 1 foot wide and the same depth, with plenty of drainage, and the two ends and front under the stage where they grow in only 3 inches of soil on the surface of the brick bottom, and they seem as happy as those growing in the foot of soil in the border. When Mr. Pettigrew planted those bulbs out three years ago they were leafless. They were washed thoroughly to kill the Encharis-mite, and after starting into growth they very soon sent up a quantity of flowers, between seventy and eighty strong spikes being in flower at onco, and they flower several times a year. Last March they had some mealy-bug on the foliage, and to clear it out all the foliage was cut off; and the leaves sent are those produced since then. D.

CONTINENTAL NOVELTIES.

ECHEVERIA PURPUSI, SCHUMANN.

This fine new succilent was discovered by the botanist, Mr. Purpus, whose name it bears, at a height of 7500 to 8000 feet on Mount Whitney, in the Sierra Nevada of California. The plant suggests at first sight E. pulverulenta. It produces handsome white-powdered foliage, surmounted by deep red orange-tipped flowers. There is no doubt this is a valuable introduction, the more so as its habitat being at a considerable elevation, will enable the plant to be grown here in the open. The plant has been introduced into comunerce by Mr. Ernst Benary, of Erfurt, to whom we are indebted for the illustration (fig. 123).

THE WINTER SHOW OF THE ROYAL HORTICULTURAL SOCIETY OF IRELAND, 1896.

I LEFT London by the 6.30 r.m. Irish mail from Euston, after having previously had a look in at the splendid exhibition of Chrysanthemuns in the Royal Aquarium, Westninster, where, what with the crowd of people and the dense, dusty atmosphere, the wonder is that the writer escaped suffocation. However, a punctual start was made. North Wall, and that part of the river Liftey on which it is

North Wall, and that part of the river Liftey on which it is situated, are not calculated by appearance or associations to impress the visitor favourably, especially in the early grey of a cold winter's morning. However, we went on our way to our destination, the Fruit and Chrysanthenum Show of the Royal Horticultural Society of Ireland, held in the splendid grounds of the Royal Society of Ireland, at Ball's Bridge, a distance of about 2 miles from North Wall, and to reach which place we had to traverse nearly the whole length of Sackville Street, a street of historic interest, and still worthy of its history. On the way we passed the promises where the luge eastings were made for the farfamed and magnifieent Palm-house at Kew. In those days Ireland evidently competed successfully with England in matters of this kind, and the name of one of the citizens of Dublinvillfor ever be associated with the erection of one of the finest horticultural buildings in this or any other country. Close by on the same side of the road, we pass the gates of Trinity College Gardens, and as I hadafterwards the pleasure of paying a visit to this interesting garden accompanied by its courteous and well-known Curator, I hope to revert to it again by-and-by. A very short distance beyond Trinity Gardens my jaunting car "jarvey" put me down at Ball's Bridge grounds, and when asked how much he wanted for doing so, he very cheerily suswered, "Tin pund, noble sir, and as much more as yer honour likes to give!"

The grounds and buildings at Ball's Bridge, where the great annual Irish horse show is held, are said to be the funct and most complete of their kind in existence and I

The grounds and buildings at Ball's Bridge, where the great annual Irish horse show is held, are said to be the finest and most complete of their kind in existence, and I can easily believe the statement, as anything finer in the way of buildings and grounds for the purpose of holding large exhibitions and sports in, it would be impossible to conceive. It was in one of the large halls in the grounds kindly lent by the Royal Dublin Society, that the Fruit and Chrysanthemun Show of the Royal Horticultural Society of Iroland was to be held, and when this was pointed out to me, I could not help exclaiming that if the society could fill this hall, its exhibition would be worth coming a long way to see, so that my curiosity in entering the show hall again some hours later—when all the exhibition bad been placed, and the show complete, may be imagined. To give a candid opinion, I must say I was somewhat disappointed at the cold and generally unfurnished appearance of the hall. Familiarity with the large London and provincial exhibitions being to some extent accountable, no doubt, for this feeling. Indeed, so large is this hall that it would tax the resources of our best English exhibitions to furnish and fill it effectively. Having said this much, I must now give my mead of praise to the show. Too Chrysanthemum classes are the first to claim attention. The Japanese, in the cut-bloom section, by their variety, extent, and quality, easily led the way, and of these, I can say without qualification, that the best of them would have held their own on any show-boards that I have seen in England, and I can only hope that next year some of our friends from Ireland may be tempted to cross the water in order to cross swords with the best of our growrs. They would be heartily welcomed, and it would surprise ms if they returned home empty-handed, or without lonour. The incurved section of the Chrysanthemum was not so well represented, and was much weaker proportionately, both in size and quality, than were the Japanese. The group

Birmingham, and London specimens.

Concluding my remarks on this section of the show, I should say there are as great, if not greater, possibilities as regards the future growth of this plant in Ireland than in

England, and once this conviction is driven home and acted upon by our Irish ronfrères, Ireland will become as famous for its Chrysanthemums as it now is for its horses and its whiskey.

The groups of miscellancous plants arranged for effect were There were three of these which were beyond excellent. praise, both in the quality of the plants and in their artistic arrangement. Many smaller groups dotted about the show were much admired, but the arrangement which seemed to were much admired, but the arrangement which seemed to be admired the most was an exhibition of autumn-tinted foliage, fruit, berries, &c., and beautiful cones of choice coniferous trees from Powerscourt. The table on which they were arranged was furnished chiefly with berries, fruit, and cones, and out of this rose tall majestic vases, filled with beautifully arranged, reminding one somewhat of the charming table of a similar description put up by the Messrs. Veiteh at the late Crystal Palace show, and which, in the opinion of many, was one of the prettiest features there.

Coming now to that important part of the exhibition in which hardy and other Irish fruit were represented, I have the which hardy and other hash the recent an equal success in this, as in the Chrysanthemums. One has been so long accustomed to on ysantiemans. On his decrease a substitute of the monster bunches of Grapes exhibited by the late Mr. Roberts, of "Charleville," that one may be excused for having a slight feeling of disappointment at the quality of the Irish Grapes—but altogether the exhibits of these was ereditable. There were splendid and numerous collections of Apples, as well as single and other dishes; and certainly, for size, many of the samples were quite equal to the largest seen in England; but in colour and good quality arpearance they cannot be compared to the best samples grown in Kent, Sussex, Herefordshire, or Worcestershire, owing, no doubt, to the moister and less sunny atmosphere of Ireland. The same remarks apply equally to Pears; many of the samples were quite as large and fine-looking as those bailing from Jersey or France—pointing out in a forcible way that the soil and climate of treland are well adapted to the growth of this important fruit.

One of the chief attractions of the show on this occasion was a collection of nearly 200 dishes of distinct varieties of fruit sent by Her Majesty the Queen from the Royal Gardens, Windser, arranged as a trophy with Chrysanthemums and windset, and to which exhibit was awarded the Gold Medal of the Society.

Medal of the Society.

Among the many miscellaneous exhibits, one of the most interesting was an exhibition of winter garden and house furniture (such as chairs, tables, plant-stands, blinds, &c.), made out of Gorse wood, in the same way that such articles are made of Bamboo. This is an industry that Mr. Parnell, M.P., brother to the late M.P. of the same name, is trying to establish in Ireland. The samples exhibited were beautifully wrought and more artistic in appear ace, in my opinion, than the same made from Bamboo; and as the supply of Gorse wood is practically unlimited in Ireland, 1 hope much success will attend Mr. Parnell's efforts to

establish a new industry for his countrymen.

I was disappointed to find that the show was not better atronised and supported by the public of Dublin, a city with upwards of 300,000 inhabitants. It may be that the show grounds are too far from the city, although there are electric train-cars running by the gates every few minutes; or it may be that the public of the city are indifferent to such exhibitions. One thing t noticed particularly with much regret, and that was the almost entire absence of the labouring classes from the show. This, I think, is much to be de-plored, and it is to be hoped that the Royal Horticultural Society of Ireland, in conjunction with other educational agencies may be able in time to come to enlist the sympathy and the co-operation of the working-classes in multiplying flower-shows to a very large extent in the villages and parishes of Ircland, with, I am sure, the most

happy results. I must conclude this note by gratefully acknowledging he courtesy and kindness of some members of the council, and also of the excellent secretary, Mr. Ross, during a hurried but pleasant visit to an trish Horticultural Exhibition.

SOCIETIES.

THE CHESTER PAXTON.

NOVEMBER 17, 18.-The seventh annual show of this Society was held in the Town Hall, Chester, on the above dates, and was in every way one of the best the Society has yet held. The competition in the various classes for Apples and Pears was keen throughout; and though the size among the kitchen varieties was not equal to that of last year, the quality was uniformly good.

For a collection of dessert Apples : 1st, Rev. L. Garnett ; and Lord Trevor and Mr. E. Severn equal 2nd.

For a collection of kitchen Apples: Mr. E. SEVERN 1st, Rev. L. GARNETT 2nd. For a collection of dessert Pears: Mr. Logan, Unton

Lawn, 1st; 2nd, Mr. E. SEVERN.

In both classes for Black and White Grapes, Mr. Gray, gr. to Sir G. A. MEYRICK, Bart., was 1st, having fine clusters of Museat and black Barbarossa.

There were five exhibitors in the class for the best-arranged group of Chrysanthemums. J. WYNN FFOULKF-, Esq., was 1st with a well-grown and fresh-looking group; and Mr. Taylon, Hoole Hall, 2nd. All of the groups consisted of well-grown plants, and formed a most creditable exhibit.

A pleasing feature consisted of boxes of single-flowered and naturally-grown Chrysanthenums, the 1st prize for single-flowered vases going to Mrs. Townsend; and the 1st for natural-grown trusses to Lord Trevor. In the large class for cut blooms, T. BROCKLEBANK, Esq., was 1st, and C. THRELFALL 2nd.

Among the non-competitive classes there was a collection of 100 dishes of Apples and Pears from Eaton Gardens; and Messrs, Dicksons were represented by an excellent group occupying the entire end of the hall, and consisting of trained Chrysanthemums, various foliage plants, and dishes of fruit, all set up most tastefully.

ABERDEEN.

NOVEMBER 20, 21.-After the lapse of eleven years Aberdonians were treated to a fine exhibition of Chrysanthemums on the above dates. The promoters feeling that the jubilee of the National Society should not be allowed to pass unnoticed, some time ago approached the directors of the Royal Horticultural Society of Aberdeen, and asked them to start such an exhibition, but want of funds stood In the way. Nothing daunted, however, the promoters set to work independently, with the result that they got together a display which proved highly successful. The prizes were, of course, few, but herticulturists came forward in good numbers, and were content to compete for places in order that the show might have a chaoce of becoming an established institution. The show was held in the Art Gallery, the flowers being laid out among the works of art, which added not a little to the effect of the whole. The great feature was the cut blooms, while those in pots being searcely so attractive.

The Hon Mrs Pirie presented the special prizes as follows: For twenty-four Japanese Chrysanthemums, Mr. James Grant, gr. to Lady Carnelle, Crimonmogate. Chrysanthemmu (any variety) Mr. E. Norman. Stoneywood. corative Chrysanthe mums, Mr. A. Gregor, gr., Fairfield.

LEEDS PAXTON.

November 24.—The seventh annual Chrysanthemum show was opened on the above date in the Town Hall. The display was one of the best yet held in Leeds. There were nearly 500 entries, and comparatively few defauters. On entering the large hall the effect was charming, and great credit is due to the curators for the very effective manner in which they arranged the large specimens, Palms, and other stove and greenhouse plants. The groups of Chrysanthemums were arranged on one side, and the groups of miscellaneous plants on the other side of the hall, while the cut blooms and table plants were upon tables running across the centre. The vegetables were staged in an adjoining room.

Groups.—In the open class for a miscellaneous group of lants, E. B. Faber, Esq., J.P., Belvedere, Harrogate (gr., Mr. Townsend), showed a well-arranged group. In the centre of this square group, raised on a piece of rustic corkwork, was a well grown Palm surrounded by Crotons and Orchids. Mr. Taylon, nurseryman, Potternewton, near Leeds, was awarded the 2nd prize.

Leeds, was awarded the 2nd puze.

There was a much keener competition in the local class for miscellaneous groups of plants. These were arranged to form a semicircle. L. CLAYTON, ESq., Oak Hill, Moortown (gr., Mr. Fleet), gained the 1st prize with a neat group lightly put up.

In the Chrysanthemum groups, the quality of the blo was superior to that of former years, but it is hoped that in future the exhibitors may break away from the stiff wall-like groups, and that the committee will allow foliage-Plants to be interspersed with the Chrysantheniums. Mrs. Terley, Fox Hill, Weetwood, was 1st; and Mr. Petuisgen, nurseryman, Harrogate, 2nd.

Cut Blooms.—In most of these there was keen competition. the Right Hoo, the Earl of HARRINGTON, Elvaston Castle, Derby (gr., Mr. Goodsere), was the most successful competitor, having gained the Challenge Cup in the class for eighteen Japanese; and also in the class for eighteen in-curveds. In the former class there were nine entries, and all the blooms staged were of excellent quality. The Earl of HARRINGTON staged magnificent blooms of the following of Harrington staged magnificent blooms of the following varieties:—Mrs. W. H. Lees, two blooms of Edith Tabor, two blooms of Madame Caract, one of which g-ined the prize as being the best Japanese in the show; Mutual Friend, John Seward, Golden Gate, Duke of York, Mrs. H. Weeks, Etoile de Lyon, Jules Chretien, Mrs. C. H. Payne, International, Niveum, Rose Wynne, Silver King, and Miss Rita Schroeter. This being the second time in succession the Ear of Harrington has won this cup, it now becomes his property. C. H. Wright, Esq., J.P., Halston Hall, Oswestry (gr., Mr. Roberts), was a good 2nd, with excellent blooms.

In the class for eighteen incurveds, the Earl of HARRING-Ton again took 1st place with two blooms of C. H. Curtis, one of which was the best incurved in the show; two of J. Agate, J. Fulford, W. Tunnington, Empress of India, Golden Empress; two of Princess Teck, Hero of Stoke Newington, Charles Gibson, Mrs. J. Gardener, Mrs. S. Colman, Miss Haggas, Major Bonnaffon, Lord Alcester, and Mrs. W. Carpenter; Messrs, Pearson & Sons of Chilwell, Notts, were

In the class for twelve incurved, distinct, the winner of the two former classes was again 1st; and the Marquis ef Ripon, Studley Royal, Ripon (gr., Mr. Kneller), 2nd. The class for twelve Japanese, distinct, was also won by the Earl of HARRINGTON.

Loral Classes .- In the local classes for cut blooms, the marked improvement in the quality, and also in the number of exhibits, was a great encouragement to the committee. The principal prize-winners in these classes were—Mrs. Bowering, Allerton Hall, Gledhow (gr., Mr. Moore), who gains the Challenge Cup for twelve incurveds, distinct; Mrs. Tetley, Fox Hill, Weetwood, who wins the Challenge Cup for twelve Japanese, distinct; Sir James Kitson, Bart. (gr., Mr. Grix); and A. T. Walker, Esq., The Elms, Weetwood (gr., Mr. Norman).

Missellaneous Plants.—In the classes for foliage and table plants, E. B. Faber, Esq., J.P.; Mrs. Bowering, Sir James Kitson, Bert.; and A. T. Walker, Esq., were the principal prize-wioners.

Freit.—Grapes, Apples, and Pears were well shown. In the open class for Black Grapes, two bunches, the Earl of Harewood, Harewood House, Leeds (gr., Mr. Jeffrey), was lst; the Earl of Fiversham, Dancombe Park (gr., Mr. Willi ms', 2nd. For two bun ches of White Grapes, 1st, the Earl of Harrington, and Sir James Kitson 2nd.

In both six baking and six dessert Apples and stewing Pears, the Earl of HARRINGTON was 1st. There were also local classes for fruits.

Vegetable Classes.—The only exhibit worthy of special note vas a splendid tray of eight varieties, exhibited by Mrs. BOWERING.

Messrs. Cannell & Sons offered a Championship Sash for a collection of fruit, vegetables, and a stand of Chrysonthemums, open to all gardening societies of Yorkshire. Having been won at Bingley last year by the Leeds Paxton Society, it was competed for this year at this show. The result was that it had to be handed over to the Horsforth Society.

Honoraga Rehibits - Messes Cannell, & Sons had a table of sprays of Pelargoniums.

Messrs, Clibran & Sons had a fine display of Chrysan-

thenums, and miscellaneous plants and fruits.

J. W. Oxley, Esq., J.P., of Spenfield, Headingly, en a
Sago Palm in flower, and by attaching the common name to it, the plant drew a number of people to the show. [But what was it? Ep.)

Mrs. Hodgskins, of Manchester, had a splendid exhibit of her skeleton leaves and Ferns.

SOUTH SHIELDS.

NOVEMBER 25, 20 - The annual show of the South Shields and Northern Cou ities Chrysanthemum Society was held in the Royal Assembly Room on the above dates. In comparison with the exhibition held last year, the display was rather less in extent, but the quality of the exhibits was higher than then.

Cut blooms - There were six connections in the class for Cut blooms,—There were six competitors in the class for twenty-four Japanese, and the premier award was won by Mr. J. Corbett, gr. to the Marquis of Normanby, Mulgrave Castle, Whitby, who had a very creditable collection. The hest blooms were Mrs. W. H. Lees, C. Davis, Mons. Pankoucke, Mutual Friend, Etoile de Lyon, Madaine Carnot; 2nd, Mr. G. Shotton, gr. to H. Andrews, Esq., Swarland Hall, Felton, Northumberland. The 3rd collection was not very far behind, but the flowers were a little coarse in the florets

The contest for the best eighteen Japanese was also won by Mr. Corbett, and Mr. G. Shorton was almost equal.

The class for twenty-four incurveds was won by Mr. G. Shorron with a good collection; the blooms were of good shape and size. C. H. Curtis, Empress of India, Violet Tom-In. J. Fieldford, Lord Alcester, Princess of Wales, Golden Empress, Robert Petfield, Lady Dorothy, Queen of England, Princess of Teck, J. Lambert, Baron Hirseh, and Mrs. Coleman were the principal blooms. Mr. J. McKenzie, gr. to the Rev. R. Burdon, Heddon Hall, Heddon-on-the-Wall, was and showed well.

For eighteen incurve ds, Mr. G. Shotton was 1st, and Mr. J. McIntyre, gr. to Mrs. Gurney Pease, Woodside, 2nd

The best twelve Japanese came from Mr. Thomas Wheeler, gr. to Mrs. Mitchell, Jesmond Towers, Newcastle-on-Tyne; and, Mr R. Pettifore, gr. to Jno. WHITE, Esq., The Cedars,

Mr. G. Suoiton was 1st for twelve incurved blooms; and Mr. J. Coultas, gr. to Alderman Hardino, Darlington, 2nd,

who had very fine blooms.

The classes for twelve Anemone-flowered and twelve reflexed varieties were won by Mr. G. Shotton and Mr. J. WHEELER respectively.

Floral Decocations were quite a feature, Mr. J. Sullivan of Sunderland being very successful in these classes.

The epergoes, sprays, and button-holes were of exceptional merit, Mr. G. Webster of Sunderland obtained two or three prizes in these classes.

Grouns and Plants.-The contest in the class for a group miscellaneous plants and Chrysanthemums was won by Mr. McINTYEE, gardener at Woodside. Primulas were of high merit, and table-plants were good. Toe bush-plants shown by residents of South Shields were very good. Mr. Wm. Partridge, gr. to Henny Franco, Esq. Cleadon Meadows, was 1st for three plants of Japanese varieties. The other bush plants, such as Pompons, incurved, reflexed, and Anemones, were of poorer quality than the Japanese, and fewer in number.

Miscellineous.—A very fine stand of Apples was shown by Messrs. Crassfor & Co., Limited, King's Acre Nurseries, Hereford. The platform was decorated by Messrs. Fell & Co., Heyham, with some very fine plants.

Hexham, with some very fine plants.

There was much attention shown to an Orange tree exhibited by Ald. Malam of South Shields, the President of the Society, which had some two dozen fruits upon it, well coloured.

DARLINGTON GARDENERS.

November 27.—Eocouraged by the success of last year's exhibition, the committee of the Darlington Gardeners' Institute held another exhibition of fruit and Chrysanthemum blooms in the Mechanics Institute on the above date. There was a very fine collection of fruit shown, but only three exhibits of Chrysanthemums were staged. A special medai was awarded to Lord Byrnard for five magnificent bunches of Grapes—Sir Joseph Pease was awarded a prize for a collect on of truit, specially noticeable among which were Marie Louise Pears and Emperor Alexander and Elizabeth Apples. The 1st prize for a dish of Pears went to Lord Derrimore of Heslington Hall, York, for a dish of Beurre Diel, and for dessert Apples to Sir Joseph Pease, who had Cox's Orange Pippin. Lady Cowell of Clifton Castle was 1st for culinary Apples, with a dish of Blenheim Orange Pippin. An extensive collection of fruit from Messrs. Jas Backhouse Sons, The Nurscries, York, and some fine specimens of Primula obcome and double Primulas from Mr. J. B. Hodesan of Elm Ridge, were much admired. Apples and Potatos, &c. were shown by Messrs, Kent & Bryton. The lat prize for Japanese Chrysanthemum blooms was awarded to Mrs. Barclay of Richmond; and a prize for anateurs was won by Mr. Percual Andrews. A very fine collection of twelve incurved Chrysanthemum blooms was shown by Aldernan Hardding.

ELGIN.

NOVEMBER 28,-As the outcome of a movement inaugurated some time ago by Mr. John Thomeson, Bishopmill, to establish a Chrysanthemum show in Elgin, a very successful show was held on the above date, of Chrysauthennums, fruit, and vegetables in the Corn Market Hall. Much greater competition might have been looked for, however, for in many of the classes there were only one, two, or three entries, so that the resources of the district were not nearly made available. This discrepancy, however, was partly compensated for by the fine quality of the exhibits, many of which, especially in the Chrysanthemum department, excited the admiration of all who saw them. The show was well patronised during the day, and the promoters have reason to feel gratified at the success which has attended their first effort. The walls of the whole interior were nicely decorated with evergreens. The arrangements were carried out by Mr. Thompson, who acts as secretary and treasurer, assisted by the members of the committee.

The principal competition was that for the best eighteen Japanese blooms, and the prize was won by Mr. Shitti, Maryhill, with a very creditable collection. His best blooms were the famous Mons, Bernard, Amos Perry, and Hairy Wonder. From the Maryhill Gardens also came the best single Japanese bloom. There was not a great display of pot plants, but such as were forward were very creditable for the season. Fruit and veget these were a large, and excellent display. In this section, Mr. Deliarro, Pitgaveny, curried almost everything before him; while Mr. Shitti, Innes House, was 1st for a magnificent basket of vegetables of six varieties.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 26.—THE DINNER. There was a numerous gathering of the members and supporters of this Society on the occasion of the annual dinner at Anderton's Hotel, Fleet Stroet, on the above date, under the chairmanship of W. Fowler, Esq.

In proposing the teast of the evening, "The National Chrysanthemum Society," the Chairman bore testimony to the efficient and admirable manner in which the Floral Committee have classified the new varieties of Chrysanthemums, a work of much difficulty, which was deserving of the best thanks of the Society, and of cultivators of the flower in general. He said that at one time the term "National" was scarcely suitable or deserved, but this was not the case now, for the Society makes steady progress. Since January 1 this year it had received an accession of 182 new members, and twenty six provincial societies had become affiliated, making eighty in all, and the members numbered 800.

The financial condition of the society, he said, was most flourishing; but he and many others would like their shows to be held in some building which is better suited for exhibitions than the Royal Aquirium; at the same time he acknowledged that the managing body of that place of public entertainment had met the society in a liberal man or. He then gave the toast of the evening, which was enthusiastically received.

The torst of the 1:36 affiliated societies was given by Mr. P. Wyferer, who, in the course of his remarks, alluded to the advantages, reciprocal in their nature, which accured from the stillation of provincial secleties one with another

and with the National Chrysanthemum Society. The head society, he said, was much indebted to them, and to none more so than the Bromley Society. In illustration of the strides made by some of the Chrysanthemum societies in this ecountry, it was mentioned that the show this year of the Scottish Horticultural Society, held in Edinburgh, was visited by 30,000 persons, and a very large sum of money was taken at the doors. Mr. W. Weeks, in returning thanks for this toast, spoke in terms of enlogy of Mr. Harman Payne and his unwearied efforts in forwarding the interests and welfare of the parent society; of Messrs, Molyneux, Measc, Lees, and others who have been instrumental in spreading a love of the Chrysanthemum in the country, and in indicating improved methods of culture. He said that he would prefer Japanese and incurved varieties being shown on different days, for as now shown together the interest taken in the Japanese was so overwhelming, that the incurved section became undeservedly neglected; and what the public looked askance at, cultivators very soon neglected altogether.

At this part of the proceedings the various trophies, cups,

At this part of the proceedings the various trophies, cups, medals, &c., were distributed by the Chairman to the rather numerous recipients, including the Portsmouth Society, whose delegate, Mr. Barry, took the Chailenge Trophy. He said that the Society intended to "come up to the Aquarium, and walk the Trophy (a shield) home again." Among the recipients of honours was Mr. Donald of Leyton Green, one of the fathers of the Society, and who received two awards, including the Gold Jubilee Medal; Mr. H. J. Johns, who took a Gold Jubilee Medal for one of the best groups of Chrysanthemums ever shown; Mr. Mease of Leatherhead, who also was awarded a Gold Medal for his stand of sixty incurved, and the same number of Japanese varieties.

Amongst the gentlemen present was M. Martinet, as representing the Nation d Chrysanthemum Society of France, and editor of Le Jacelon, who in good English, gave a brief account of the Chrysanthemum in France as an object for exhibition. In regard to this matter his countrymen are not quite on a level with the English growers, having only been engaged in it for a period of ten years, but they hoped shortly to compete on terms of equality. Mr. Harman Payne, he said, was very well known in France, where they were very glad of the co-operation of any one who could a lyance the aims of the French societies; and he had been appointed a Knight of Le Merite Agricole.

A rather large toast list was duly got through, the proceedings being enlivened with instrumental and vocal music.

DECEMBER 1, 2, 3.—The last of the series of exhibitions by the National Chrys urthernum Society, for the present year, was opened on Tuesday last in the Royal Aquarium, Westminster. It was undoubtedly a very fine show, and a capital close to the Jubilee season. As will be seen from the report which follows, the number of exhibits was unusually high in many of the classes, and the quality of the Japanese and incurved flowers alike was satisfactory. The entire show was held in the golleries, this arrangement being necessary on account of the whole of the floor space being devoted to the ladies' bicycle races! At this late exhibition there are no classes for groups of Chrysunthemum plants or for specimen trained plants.

CUT BLOOMS (OFFN CLASSES).

Japanese.—When it is stated that there were eighteen competitors in the principal class, viz., that for twenty-four Japinese blooms, in not fewer than eighteen varieties, it will be expected that the flowers in the first prize collection were of more than ordinary merit. Such was the case, and the winner was Mr. W. Messenger, gr. to C. H. Bernirs, Esq., Woolverstone Park, Ipswich. The varieties were: Back Rose, Machame Carnot (especially good), Interactional, Golden Gite, Waban, Mille, C. Molin, Elmer D. Smith, Etode de Lyon; Gatze, Mons, Chenon de Leché (very fine colour), Rose Wynne, Graphic, Duchess of York, Niveum, Etode de Lyon, Molle M. A. de Galbert, Elmer D. Smith: Front, Golden Gate, Silver King, Rose Wynne, Geauty of Castlewood, Violetta, Le Primee du Bois, Miss M. Blenkiron, and Silver Cloud. The exhibitor who was awarded 2rd place was Mr. W. Slogrove, gr. to Mrs. Crawrond, Gatton, Reigate. The most noticeable of the blooms in this stand were Madame Carnot, Madame A. Chatin, Primyose League, Golden Gate, and Madame E. Capitant. 3rd, Mr. G. Hunt, gr. to Pastia Ralli, Esq., Ashstead Park, Fipson. An extra prize was awarded to Mrs. James Striedwick, Silverhill, St. Leonards on-Sea.

The second class was one for twenty-four bunches of any world.

The second class was one for twenty-four bunches of any varieties of Chrysanthenums. Six competed, and there were scarcely two exhibitors who had similar ideas of the kind of arrangement most desired. The 1st prize was well taken by Mr. Norman Davis, The Vineries, Framfield, Sussex, who had good bold bunches of fine blooms, exhibited with considerable stem and foliage, in glass and earthenware bottles. 2nd, Mr. R. C. Normar, Broughton Road Nursery, Ipswich. In the case of one exhibit, the blooms were haddled upon the tops of the bottles, and in such manner that many of them might have been mistaken for single blooms.

The best twelve Lipanese blooms were exhibited by Mr. H. Perkins, gr. to the flon. W. F. D. Smith, Greenlands, Henleythe Thames.

Of the seventeen other collections, the best was that from Mr. W. MESSPAGER, who had a good lot indeed; find, Mr. J. Sandford, gr. to G. W. WRIGHT INDEE, ESQ., Wood House, North Finchley.

North Financy.

Mr. Henry Perrins won for the best six Japanese (distinct)
There were sixten collections.

The best twelve bunches of Japanese flowers came from Mr. R. C. Notcut, who was followed by Mr. Norman Davis and Mr. W. Howe, gr. to H. Tate, Esq. Park Hill, Streatham,

The 1st prize for six bunches of Japanese blooms was awarded to Mr. W. Slogrove, gr. to Mrs. Crawford, Gatton Park, Reigate. Mr. N. Davis who was placed 2nd, exhibited to good advantage.

Tacurred.—The best collection of twelve incurved in six varieties, was one from Mr. W. Neville, whose blooms were of good quality and even. The varieties were R. C. Kingston, Major Bonnaffon, J. Agate, C. Curtis, W. Tunnington, Bonnie Dundee, and King of Orange. 2nd, Mr. H. Butcher, gr. to C. J. Bass, Esq., Lodge House, Smeeth, Ashford. Mr. Jas. Agate was a fairly good 3rd, and there were nine other exhibitors.

The best six blooms (distinct) were from Mr. W. Neville, gr. to F W. Flig htt, Esq., Cornstiles, Twyford, Winchester.

Single Flowered Varieties.—The best nine bunches of largeflowered varieties were shown by Mr. G. W. Forbes, gr. to D. Nicots, Esq. This class made a very fine display, and Mr. W. C. Pagram, gr. to J. Courtenax, Esq., The Whim, Weybridge, and Mr. A. Feldate, jr., The Norseries, Hersham, Walton-on-Thames, who were 2nd and 3rd respectively, had creditable collections.

Mr. G. W Forbes was again 1st in a competition for the best twelve bunches of small-flowered varieties, followed by Mr. W. C. Pagbam, and Mr. A. Felgate. The last named exhibitor was successful for six bunches of large-flowered varieties, followed by Mr. Jas. Agate, Havant Nurseries, who, however, w on the class for six bunches of small-flowered varieties.

AMATEURS.

The best six Japanese blooms in not fewer than three varieties were from H. A. Needs, Esq., Heath View, Woking, The varieties were Mutual Friend, very large, Phoebus, and Niveum. 2nd, Mr. F. Durrant, 4, New Road, Ware, Herts.

The vases of Chrysanthemums arranged with coloured foliage, a.c., were upon the whole tasteful and pretty. The 1st prize was taken by Mr. D. B. Crane, Woodview Terrace, Archway Road, Highgate; 2nd, Mrs. W. Green, jr., Harold Wood, Essex.

MISCELLANEOUS PLANTS.

There were excellent exhibits of Cyclamens and Primulas. The best collection of Primulas (open) was shown by Mr. J. Gibson, gr. to E. H. Warris, Esq., The Avenne, Chiswick. These were tastefully exhibited upon a table and interspersed with small Palus, Codiacums, Ferns, and other plants for effect. 2nd, Mr. T. P. McGregor, gr. to the Dowager Lanv H vy, North House, Putney Hill.

Mr. Girson was also the best exhibitor of twelve plants in flower of Primula sinensis, being followed by Mr. R. Bassil, gr. to P. H. Evans, Esq., Shooter's Hill House, Pangbourne,

The best dozen plants of double-flowering Primulas was from Mr. J. Samlford, gr. to G. WRIGHT INOLE, Esq., Wood House, North Finchley.

Cyclumens as a collection were best shown by Mr. W. Orrwood, Cowley Mill Road, Uxbridge, who filled one of the tables with extremely satisfactory plants in several varieties. No miscellameous plants were used by this exhibitor, but in the collection from the Church Road Nursery Company, II mwell, which was awarded 2nd prize, a few were included to advantage.

to advantage.

Mr. W. Frost, gr. to G. Ashley Dodd, Esq., Godington,
Ashford, Kent, exhibited capitally in the class for 12 plants
of Cyclamens (nurserymen excluded), but there was no
competition.

There were two exhibits of a collection of berried foliage and flowering plants, and the one that obtained for Sir Ed. Salnders, Fairlawn, Wimbledon (gr., Mr. Newell) the 1st prize was a highly creditable one. Poinsettias, Crotons, Peros, Primulas, Cyclamens, Bouvardias, Roman Hyacinths, Arc., were arranged in excellent taste, and if there was fault at all it was in the plants being placed a little too thickly. and, Mr. W. Howe, whose plants were too large for the size of the table upon which they were arranged

The best basket of berries and foliage was shown by Mrs. W. Green, jr., Harold Wood

HONORARY EXHIBITS.

These were made by most of the Chrys inthemum specialists, and there were some fruits and vegetables shown. Mr. Norman Davis had a few blooms of varieties useful for decorative purposes, of which Frantield Pink may be mentioned as the most promising.

the most promising.

Mr. W. J. Godfrey, Exmouth, showed a good number of gut blooms, including several novelties.

ent blooms, including several novelties.

Messrs. Donnie & Co., Rothesay, had a collection of about eight dozen large blooms, and at the back were pretty braches of single-flowering, pompon, and decorative varieties.

From Mr. Robt. Owen came two dozen very fine incurved blooms, in a few varieties, and a similar number of Japanese blooms.

Vases and glasses of Chrysantheniums were shown by Miss Easterbrooke, and Mr. T. Tullett, gr. to G. Alexander, Esq., Brentwood.

From the Earlswood Nurseries, Mr. Wells contributed about four dozen fine blooms, principally Japanese varieties, and also a display of decorative and single flowers.

Messrs, H. Cannell & Sons, Swanley, made their usual exhibit of exceedingly bright Pelargonium flowers in sprays, and likewise exhibited some Chrysanthemum blooms.

and likewise exhibited some Chrysanthemum blooms.

A pretty table of fruits in dishes, relieved by very well borried plants of Solanums, and other decorative plants, was shown by Messrs JNO. LAINO & SON, Forest Hill Nurseries, London, S E

Mr. H J Jones, of the Ryccroft Nursery, Hither Green, Lewisham, had a very large group of Chrys inthemum plants. about 35 feet long and 12 feet wide. The side of the building to which these abutted was draped in shades of green. Foliage plants were used to increase the effect, which was most satisfactory.

most sausacrory.

Mr. J. Williams, Oxford Road, Eding, had a stand of "Rustic" table-decorative appliances, and the Averci in Eal and Horizottural Association, Lib., were represented.

Mr. C. J. Waites, gr. to the Hon. W. P. Talbor, Glenburst, Esher, exhibited a collection of first class vegetables.

Messrs J. PEED & Sons, Roupell Park Nurseries, Norwood Road, London, S.E , showed Pears and Apples.

FLORAL COMMITTEE.

A meeting of the Floral Committee was held, but there were few subjects submitted for consideration. Two First-class Certificates of Merit were awarded, one to Mr. Wright, a large deep Japanese variety, with petals of medium breadth, drooping, full substance, and highly promising, a seedling raised by Mr. H. J. Jones, Ryecroft Nursery, Lewisham; and to Japanese Commodore, blush tinted with lilac, a large to Japanese Commodore, blush tinted with like, a large broad-petalled variety, and like many others incurving first and reflexing afterwards, from Mr. H FEATHERBY, Gillingham. The question of doubtful incurved varieties was warmly debated, and Egyptian, a variety shown numerously in Mr. H. J. JONES group of plants, where some of the bluoms were as perfectly incurved as Prime Alfeet the committee of the state of the second state. curved as Prince Alfred; the committee again decided to place it among the incurved Japanese. Duchess of Fife was sent by Mr. C. Bellis, Ludlow, with the request that the committee would pronounce whether it was an incurved or not; but there was much difference of opinion among the committee on this point. The matter is to be threshed out by a special sub-committee, shortly to be appointed. Miss Louise D. Black, an incurved, was shown by Mr. Goperky, but the committee declined to acknowledge it as such. Mr. H. J. JONES had a yellow sport from Madanic Carnot, which he proposed to call Mis. F. A. Beyan. It was thought to be darker than the sport shown by Mr. Wells, and the committee wished to see it again. Mr. W. HARVIV. Chishchurst, had Mrs. R. B. Martin, which will probably be seen in better condition on a future day.

THE ORIGIN OF GARDEN GLADIOLI.

THE praise given to Gladiolus Nanceianus by your London correspondent in Garden and Forest for October 7, is well deserved, and I think it may interest your readers to hear something more about the origin of this and other remarkable garden races of this noble genus.

The Gladioli of gardens may be distinguished in an early-flowering and an autumn flowering group. The large group of early Gladioli embraces innu merable forms of species and hybrids, where, amongthe most common types, are the Cape species Gladinlus blandus, G. cardinalis, and G. tristis; and the hybrids G. ramosus (cardinalis oppositiflorus), G. Colvillei (tristis x cardinalis), &c. I cannot treat this section in detail now, and will only say that one of the most useful new additions to it is the soft rosypink cardinalis variety, Queen Wilhelmina, which has been highly spoken of in various gardening papers.

The late-flowering Gladioli have so improved of late, that the original species have become very insignificant, compared with the gardon hybrids of their progeny. Five distinct races of autumnflowering hybrid Gladioli have been sent out up to the prosent, an abbreviated description of which may follow here:-

1. Gladiolus hybr. Ganduvensis.-This section is well knowu, although there is still some doubt as to its exact origin. The first announcement of the original hybrid appeared in Van Houtte's Catalogue, No. 6, which was published on August 31, 1841. There are two opinious as regards the origin of this hybrid. In the Flore des Serres, published by Van Houtte himself, it is stated to be the result of a cross between G. cardinalis and G. psittacinus. On the other hand, we have Dean Herbert's opinion, who found that the indicated cross, "if not absolutely impossible, is so difficult, that repeated attempts made during successive years (by himself and others) have all proved abor-Ou the contrary, the Natal species, G. psittaeinus and the Caffracian G. oppositiflorus, have been freely crossed by Herbert and several others, and the result was exactly the same Gladiolus figured in the Flore des Serres as Gandavensis. The hybrid created a sensation, but was, of course, soon

surpassed. The most successful raiser of new varieties was Mons. Souchet of Fontainebleau; and after his death, in 1872, his successors, Messis. Socullard and Brunelet.

2. Gladiolus hubr. Lemoinci. - Some twenty-five years ago a new species of Gladiolus was introduced from the Cape, which proved to be hardy, or, at least, more hardy than the Gandavensis varieties. It was crossed by the skilful hybridiser, Mons. Lemoine, with the best Gandavensis varieties, and so be obtained the first hybrids of a new race which he called Lemoiner, and which made its appearance at the Paris International Exhibition of 1878. Being pretty well known at present, it does not need description. Every year the colours of the new varieties become more brilliant and effective. It is a pity, however, that the more beautiful the varieties become, the more they lose their hardy qualities, a natural consequence of the little purpureo-auratus blood remaining in the progeny.

3. tiladiolus hybr. Taricensis and Childse. Both of these sections originated in the same unmernamely, by crossing Gladiolus Sanndersi, another Cape species, introduced some twenty years ago, with Gandavensis varieties. G. Turicensis originated in Mr. Froebel's nursery at Zurich; it is probably lost to cultivation now. The history of G. Childsi is rather confused. Many years ago Herr Max Leichtlin made a similar cross as Mr. Froebel, and sold the hybrids obtained to a French nurseryman, from whom they were purchased by an American firm, the stock of which weut afterwards to Mr. Childs of Floral Park, who gave them his name and pushed them Aureessfully

4. Gladiolus leght. Non comus. - This race, referred to by Mr. Watson, is of quite different origin from Gladiolus Childsi, and the two races must not be confounded. G. Nauceianus was the first hybrid of a series now comprising some lifty varieties, raised by Mous. Lemoine, and first presented to the horticultural public at the Paris Exhibition of 1889. It originated from a cross between G Saunderst and Lemoinei varieties, and this origin at once shows that the Nanceianus race is an advance on Tucicensis and Childsi, as one of the parents, namely, Lemoinci hybrid, was an advance on one of the parents in the other case (Gaudavensis hybrids. A few varieties of the Nancelanus race are not so vigorous as could be desired, but the newer ones especially are strong growers, throwing up spikes 6 feet tall, carrying large-sized flowers, often measuring more than 7 mches across between the tips of the two lateral segments of the corolla, which are developed in the form of two large triangular, fully-expanded wings, and the colours are simply marvellous. All the trade varieties hitherto introduced were obtained by Mons. Lemoine, and we have not seen any hybrids from other origins surpassing them.

5, tiladiolus hybr, Massiliansis.-Although this is one of the newest races offered, it is in no way an a lyance, which is not surprising when we remember that one of the parents is the very old and ugly Gladiolus psittacious, which has been improved by hybridising for fifty years already. We only refer to it here for completeness.

Concluding, I beg to give a little pedigree showing the affinity and origin of the principal races of Gladiolus hybrids referred to above : ~

PROPOSED VINE CULTIVATION IN SOUTH IRELAND .- An Italian, Signor Egidio Vitali, who is concerned with Vine-growing in northern Italy, having been recently through those portions of southern Kerry and Cork, the climate of which is so largely modified by the influence of the Guli Stream has written to the Earl of Kenmare suggesting th a trial should be given to the culture of the Vine in those districts. He has pointed out to his lordship that several trees and shrubs which grow in mild climates thrive in Killarnoy and other places in the south, which, in this respect, have the advantage of northern Italy, where the Viue flourishes; and he has offered to provide hardy Vines for those regions for experimental planting in Kerry. It is worthy of note that the Marquis of Bute has tried a similar experiment in the neighbourhood of Cardiff, where the climatic conditions are not as favourable to its success as those found in South Kerry. Western Morning News.

re term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr, for the period named: and this combined result is expressed in Daydegrees—a "Daydegree" signifying 1° continued for twenty four hours, or any other number of degrees for interesting and period of the period of the control of an inversely proportional number of hours.)

7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending November 28, is

the British Islands for the week ending Sovember 25, is furnished from the Meteorological Office:—

"The nather was cloudy or dull during the greater part of the week, but mostly very dry. Much fog prevailed over limital during the cather days of the period, but towards as close both the cloud and for dispersed, and Saturday was ary fine and bright

"The 'emporter was considerably in excess of the mean in Scotland, 'England, N.E.,' and 'Ireland N.' and just equal to it in the 'Midland Counties,' England, N.W., and Ireland, S.;' in the other districts there was again a deficit. repull to it in the annual counters. Loganos, a.e., and be breamly, S.; in the other districts there was again a deficit. The highest of the maxima, which were recorded on the 22nd, ranged from 59 in 'Scotland N.,' and 'o in Scotland, E.' and 'Ireland, S.' to 49' in 'England, I.' and the 'Midland Counties,' The lowest of the minima were registered either on the 27th or 28th, and ranged from 25' in Scotland, W.,' and 27' in 'England, S., to 3' in 'Scotland, E.,' and 37' in 'Product N.E.' England, N E '
The rainfull was much less than the mean in all distric's,

but heavy, locally, it Stormowty

The bright sanshine was very deficient generally, but just equalled the normal in 'England, S.' and slightly exceeded it in the 'Channel Islands'. The percentage of the possible amount of duration ranged from 18 in 'England, S.', and 15 in the 'Channel Islands' and 'Ireland, S.' to 5 in 'Scotland, N.', 'England, N. W.' and to 3 in Scotland, E.'

COVENT GARDEN, DECEMBER 3.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

Potatos.

Arrivals have considerably increased during the week, and less money is being taken to clear, especially for middle-class stuff. Present prices. Dumbar Main Grops, 95s. to 199s.; Lincoln do., 75s. to 85s.; other varieties, 59s. to 65s.; Blackands, 40s. J. B. Thomas.

SEEDS.

LONDON: The. 2 - Messrs. John Shaw & Sons, Seed LONDON: The: 2 — Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., describe to-day's market as poorly attended, with but few transactions passing. Indeed, as regards Clover-seeds, business seems tightly postponed until the New Year, meantime value generally keeps steady. For Canary and Hemp-seed the sale is slow. Niger seed appears almost unobtainable There is no change in either Mustard or Kape-seed. The evently arrived Californian Butter Beans being cheap and

good, have proved an acceptable novelty. The severe weather tends to harden values for Peas and Haricots. Freights for Wisconsins owing to the closing of the American labes have advanced.

FRUIT AND VEGETABLES.

GLASGOW: December 2.—The following are the averages of the prices current at market during the past week :- Fruit : First: Pears, 6d per lb.; Apples, 1s. to 2s. 6d. per stone; Tomatos, Guernsey, 5d. per lb.; do., Scotch, 64d. do.; Grapes, home, 1s. to 2s. do.; do., foreign, 4d. to 6t do. Vegetables: Turnips, white, 2s. to 2s. 6d. per dozen bunches; Swedes, 1s. to 1s. do., and the state of th Turnips, white, 2s. to 2s. 6d. per dozen bunches; Swedes, 1s. to 1s. 2d. per cwt.; Saroys, 1s. to 1s. 3d. per dozen; Cabhages, 8d. to 9d. do.; do, late, 1s. to 1s. 6d. do; do., Red, 2s. 6d. to 3s. do.; Cauliflowers, Dublin, 2s. to 2s. 6d. per dozen; Parsnips, 4s. 6d. per cwt.; Herbs, assorted, 1d. to 2d. per bunch; Leeks, 1s. 3d. to 2s. 6d. per dozen bunches; Mint, 6d. per bunch; Onions, Dutch, 3s. per bag; do., Portugal, 1s. per stone; do., Globe, 3s. to 3s. 6d. per cwt.; Parsley, 5s. to 6s. do.; Greens, 4d. per bunch; Celery, table, 2s. per bundle; do., common, 9d. to 1s. do.; Potitos, best 8d. per stone; Carrots, 2s. 6d. to 3s. 6d. to 3s. 6d. bunch; Celery, table, 2s. per bundle; do, common, 90. to 1s. do.; Potatos, best, 8d. per stone; Carrots, 2s. 6d. to 3s. 6d. per cwt.; Artichokes, 10s. to 14s. do.; Cucumbers, 4s. to 4s. 6d. per dozen; Lettuees, 6d. to 9d. per dozen; do., French, 9d. to 1s. do.; do., Cos. 9d. do.; Radishes, 9d. to 1s. per doz. bunches; Horseradush, 2s. to 3s. per bundle; Mushrooms, 1s. to 1s. 3d per lb.; Bectroot, 6d. per doz.; Cress, 3d. per basket; Brussels Sprouts, 1s. 6d. to 1s. 9d. per

LIVERPOOL: December 2.—The following are the averages of the prices current at the undermentioned markets: St. John's: Potatos, vl. to 10d, per peck; Grapes, English, 2s. to 3s. per pound; do., foreign, 6d, to 8d, do.; Pines, English, 4s. to ss. each. Birkenhead:—Potatos, 6d, to 8d, per posk; Grapes, English, 2s. 6d, to 3s. 6d, per pound; do., foreign, 6d, to 8d, do.; Pines, English, 4s. to 8s. each.; North Hay: Turnips, 1ss. to 1ss. 6d, per ton; Potatos, Glants, 1s. 9d, to 2s. per cwt.; Main Crop. 2s. to 3s. 3d, do.; Champions, 1s. 10d, to 2s. 4d, do.; Sutton's Abundance, 1s. do.; Bruces, 1s. 10d, to 2s. 4d, do.; Sutton's Abundance, 1s. do.; Bruces, 1s. 10d, to 2s. 4d, do.; Carter's, 1s. 9d to 2s. 2d, do.; Turnips, 6d, to 4d, do, do. do. Carter's, 1s. 9d to 2s. 2d, do.; foreign, 2s. 4d, to 3s. 6d, per cwt.; Carrots, 6d, to 8d, per lozen bunches; do., do. do.; Oreign, 2s. 4d, to 3s. do.; Parsley, 6d to 8s. 6d, of do., foreign, 2s. 4d, to 3s. do.; Parsley, 6d to sd. per dozen bunches; Cauliflowers, 1s. to 2s. per dozen; Cabbages, 8d, to 1s. 6d, do.; Celery, 8d, to 1s. do. LIVERPOOL: December 2.—The following are the averages of

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending November 25, and for the corresponding period in 1895, together with the difference in the quotations. These figures are based on the Official Weekly Return :-

ENQUIRIES.

"He that questioneth much shall learn much,"-BACON.

LANDLORD AND TENANT .- Can any of your readers inform me where the fullest details can be obtained as to the relative position of landlord and tenant with respect to the market gardening and nursery business, details giving also an outline of a fair agreement in a lease of not less than twenty-five years, especially with regard to greenhouses, packing sheds, boilers, tanks, and other necessary buildings for the earrying on a business as market nurseryman and greatly oblige A Subscriber.

COUCH-GRASS .-- E. CADMAN would be glad if any of our readers who have had experience in ridding farm-land of Couch-grass, would inform him if it will pay him best to have 90 acres of heavy top and bottom land cleared by day-work or piece-work.

BOOK ON FRUIT TREES: P. C. P. It is not clear from your note whether a Manual on market fruit culture is required, or one descriptive of methods of pruning and training garden fruit trees. If the first, you should obtain Fruit Farming for Profit, by G. Bunyard, published at Maidstone, 29, Week Street, by Frederick Bunyard, or, Fruit Culture for Small Holdings, by J. Cranston, published by

Jakeman & Carver, Hereford. If the second is required, The Scientific and Profitable Culture of Fruit Trees, from the French of M. Du Breuil, published by Lockwood & Co., 7, Stationers' Hall Court, will be found a very useful book.

CATTLEYA-FLY: A. B. You might try the effect of fumigation with Richards' XL All on the fly, but the surest way is to cut off and burn all pseudobulbs which have been pierced by the grubs.

CHRYSANTHEMUM SPORTS: T. L. From the specimens sent, we should be very rash did we estimate the value of your sports, but is not that from Golden Empress of India, merely a reversion!

Chrysanthemums: A. B. We cannot undertake to name varieties of florists' flowers. Send it to some specialist.

CRICKET BATS: C. R. Salix caprea, common Sallow or Willow, one of the earliest Willows to flower.

CYPRIPEDIUMS. G. K., Cheshire. It is not an uncommon occurrence for Cypripediums to produce twin-flowered inflorescences. Some growers think that some varieties do so more readily than others, and consequently yours may again produce two flowers on a spike, if such be the case. It is, however, more likely that the strength of the plant is the reason for the extra flower.

MARKET GARDEN ACT OF 1896: P. & S. If you mean the Rating Act passed by the present Government. Yes. Certainly, it applies to Market Gardens and Holdings, but it is being variously construed by the rating authorities, and test cases will have to be taken before the Courts for a judicial interpretation of these confused Rating Acts. See also present issue, pp 692, 698.

MELONS IN THE MIDDLE OF APRIL, AND CUCUMBERS IN MARCH: S. G. K. By sowing two seeds of a small quick-ripening variety, or singly in 60's, say one of Davenham Early, Beauty of Sion, or Hero of Lockinge, about the end of the present month in a well-prepared hotbed, having top-heat of 70°, and bottom-heat of 80°, nice strong plants may be obtained fit for planting out at the end of January. They must be once or twice reported during that time, and always low down in the pots. Use as soil -loam three-quarters, leaf-monld one-quarter, and a small quantity of sand if the loam be very stiff. Cucumber plants may be raised similarly, and if they can be placed in a slightly lower temperature after the first pair of true leaves have grown to 3 inches in diameter, it will improve them. You ought to obtain a manual on the subject, and one may be purchased at the Baraar office, 170, Strand, W.C., entitled "Cucumber Culture for Amateurs," by W. J. May; price 1s.

Names of Fruits: J. Il'. Apples: 1, Besspool; 2, Cox's Orange Pippin; 3, Braddick's Nonpareil; 4, Dumelow's Seedling. Pears: 2, Hacon's Incomparable; 3, Easter Beurré; 4, Not recognised. — A. L. T. 72, Cox's Orange Pippin; 89, Minshall Crab; 99, King of the Pippins; 70, Bedfordshire Foundling; 13, Braddick's Nonpareil; one other without a number, Golden Reinette.—A. L. T. Lot 3: 19, Tom Putt; 37, King of the Pippins; 64, Coe's Golden Drop; 63, Fearn's Pippin; 58, Northern Spy'; 62, Not known.—Drummond & Sons. Pear: Gilogil.—Captain II. Rogers. The Apple you send as Cornish Gilliflower is not that variety at all. We do not know what it is. That named London Pippin is more probably Baumann's Red Winter. Gansell's Bergamot is Beurré Red Winter. Gansell's Bergamot is Sterckmans. The large Pear is unknown.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—J. S., Bohemia. 1, Pteris longifolia; 2, not found nuder number, but a piece of Stenotaphrum americanum unnumbered; 3, Lastrea (Pycnopteris) Sieboldii; 4, Pteris hastata macrophylla; 5, Nephrolepis pectinata; 6, Poly-Cypripedium vernixium (villosum Argos).—
T. E. 1, Nephrodium molle 2, Nephrolepis tuberosa; 3, Polypodium subauriculatum; 4. Davallia (Microlepia) platyphylla .- Constant Reader. Pancratium illyrieum, a tolerably common half-hardy bulb.— Oshorac. 1, Quereus glabra; 2,

Cryptomeria japonica; 3, Cryptomeria elegans.— E. C. F. The bloom is not sufficiently good to indicate its true character. We prefer not to attempt to name florists' varieties.

OLD PASSION-FLOWER IN A COLD VINERY: T. F. Having selected the main shoots which are to remain, spur in the laterals closely on these, and remove all other shoots. The operation will require to be severely carried out, and if plants in pots or shorters are grown beneath the plant, the main shoots of the latter should not be nearer together than 2 feet. The plant does not flower because the tangle of shoots do not get ripened for lack of air and sunlight. The border in which the plant is growing may need partial renewing, and the present is a suitable time to do this.

SOFT TENNIS LAWN: A. Put in a few cross drains—say three at 3 feet in depth; take away the surface soil to a depth of 5 or 6 inches, then put on a layer of coal-ashes 3 inches thick, and above this another of learny soil, make all firm and level, and relay with the best of the old turf, completing the turing with new turf free from weeds; beat and roll it well, and leave it to settle, not using it for play before the spring.

PARIS SHOW: Daval et Fils. We thank you for your letter calling attention to our report of the Paris Chrysanthemum show. At this season of the year there is an enormous pressure on our space, and we are compelled to limit the number and the length of our reports. You will see by the last paragraph in the report complained of that we shall refer to the Paris show again shortly, but we can in no ease undertake to name all the successful exhibiters.

VINES: T. F. The Vines may be pruned at any time whilst they are at rest, and then no styptic will be required, there being no "bleeding" to fear. If the Vines are to be grown without fire-heat, they must be allowed to break in April, keeping the house as cool as you can till then. On purpose to push on the growth at that season, you may, after the lapse of a fortnight, use enough fire-heat to keep the house at 55° by day, 45° by night; or you may obtain as good results and a sufficiently high degree of warmth by building up a heap of fer-menting stable dung and tree-leaves on a platform of boards placed on the border, being careful not to have too much of the pungent ammoniacal fumes from the same confined in the vinery, but afford a few small openings for its escape day and afford a few small openings for its escape day and night. If fire-heat is employed, the syringe may be employed twice a day, and if dung and leaves, once on bright days will suffice for two or three weeks, or till the Vines are well broken. Pay attention to our calendarial articles. If the border should need to be partially or wholly renewed, now is a good time to attend to this matter, although entire renewal is better done in September. Get Vines and Vine Culture, a useful manual, by Mr. A. F. Barron.

WHITE FLOCCOSE SUBSTANCE ON BARK OF BEECH Tree-Lover. See answer to "Mrs. B." in our issue of November 21, p. 639.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE.

IMPORTANT TO ADVERTISERS. - The Publisher has the satisfaction of announcing that the circulation of the "Gardeners" Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of more than 90 per cent., and that it continues to increase weekly

Advertisers are reminded that the "Chronicle" circulates among COUNTRY OENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertise-ments must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position .- Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

Notice to Advertisers.—In many instances Remittances in Payment of Repeat Adver-tisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remit-ting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. Cove, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.

Subscribers who experience any difficulty in chtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint.)

Gardeners' Chronicle.

SATURDAY, DECEMBER 12, 1896.

SCOTTISH GARDENING.

() N the evening of December 1 au interesting and instructive lecture was given before a crowded meeting of the Scottish Horticultural Association in their rooms, 5, St. Audrew Square, Edinburgh, under the presidency of Mr. R. W. E. Murray, by Mr. Robertson Monro, Langside, Glasgow, a well-known veteran in horticulture. Before the main business of the evening was entered upon, the treasurer, Mr. Alexander Mackenzie, stated that the total cash taken at the great Chrysauthemum Show amounted to £1100, which, after the payment of all expenses, and of donations to several charitable institutions, will leave a handsome balance.

Mr. Monro started with the formation of the Royal Caledonian Horticultural Society in 1809, followed by the opening of Europe to British travellers-through all the Powers making common cause against Napoleou. Deputations were sent by the Caledonian Society to the continent in search of information, and travellers such as David Douglas, Jeffery, Brown, Hooker, McNab, Fortune, and Darwin, added to our stores of material and of knowledge. Botanic Gardens were also formed in most of our British possessions, and these sent such enormous quantities of plants to the Edinburgh and Glasgow Botanie Gardens as to tax to the utmost the resources of Hooker, Graham, Balfour, McNab, and others. The plants were liberally distributed among the Edinburgh nurserymen. Many good things were, however, lost through the rapid influx of novelties.

The new plants, with their unfamiliar names, furnished new stimulants to the higher scholarship of journeymen and approntices, and it was under such influences that not a few of those who now hold the highest rank in the profession. have rendered the name of Scottish gardeners famous throughout the world. The introduction of evergreeu trees also did much to alter and abolish the topiary style of torturing and clipping Yews and other shrubs. One can hardly conceive of anything more sad than to picture a Scottish gardener who is said to imbibe metaphysics with his mother's milk, torturing plants, and especially the Yew, into gawky imaginary images of Adam and Eve, or whistling "Scots wha ha'e," &c., while slashing it into the form of Cleopatra's needle.

The annuals of Douglas and others also greatly curtailed the areas devoted to florists' flowers. For a time annuals became the rage, and forty years ago pilgrimages were make to Drummond Castle to admire the broad and brilliant massing of annuals and other bedding-plants. Had the annuals proved as persistent as they were fresh and sbeautiful, Scottish as well as British horticulture might have escaped, or had a milder attack of the perhaps inevitable scarlet-fever.

J. C. LOUDON.

But Mr. Monro hastened to note the lasting service rendered to horticulture by J. C. Loudon. Before his day the knowledge of the science and practice of the gentle craft of horticulture was handed on from sire to son. Loudon gave horticulture a literature. His Encyclopadia of Gardening and his Arboretum, which is said to have cost him £10,000 to print, besides employing six artists for years on the illustrations, proclaim him the greatest of garden writers.

And then Loudon was also the father of our periodical literature. His Gardeners' Magazine (a monthly) was the first, and a pold and successful attempt to link together practice and science in horticulture. Andrew Knight's valuable experiments, communicated through the London Horticultural Society, would have been years in reaching the masses of horticulturists but for the existence of Loudon's Gurdeners' Magazine, which brought them directly to bear on the progress of Scottish horticulture. Loudon was of the greatest force in collecting and distributing horticultural information in his day and since; and Mr. Monro suggests the perpetuation of his name and his influence by the awarding of a Loudon Medal to noteworthy horticultural productions.

HOT-WAIER HEATING, ETC.

The introduction of hot-water heating in 1826, though it was not generally used until thirty years later, combined with the removal of the duty on glass in 1845, gave a marvellous stimulus to Scottish and to general horticulture. Duty was also paid upon coal up to 1830. Referring briefly to old and new styles of building glass-houses, the introduction of the mowing-machine was alluded to, this also was everal years coming into general use.

DR. LINDLEY.

Mr. Monro noted, as one of the most notable events of his early days in Aberdeenshire, the advent of Dr. Lindley and the appearance of the Gardeners' Chronicle. If Loudon gave gardening a literature, Lindley gave it a philosophy, as illustrated in every page of his Theory and Practice of Horticulture, and his incisive leaders in the Gardeners' Chronicle. The Scottish Gardener, then, had a rather short, though useful, career. Mr. Monro consoled his audience for the absence at present of special Scotch organs, by recalling the fact that Dr. Hogg, the editor and proprietor of the Journal of Horticulture, is a Scotsman and a true gardener, having served his apprenticeship with the Messis, Liwson, George IV, Bridge; and that Mr. Fraser, of the tairdening World, is also a Scotsman.

CHANGES OF TASTE.

Mr. Monro proceeded to describe the bedding-out system mainly in connection with two of its most noted representatives, the late Mr. Donald Beaton, then of Shrubland Park, and Mr. David Thomson, still with us at Drumlanrig. Among those that did not catch the fever, nor get severely bitten with the rage for bicolor and tricolor Pelargoniums, was Mr. James McNab, of the Botanic Gardens, Edinburgh, who thus saved many valuable hardy plants from destruction in the general rush after popular fa-hion.

As to other changes, Heaths and New Holland plants are now seldom seen; and even Pelargoniums, once the glory of July shows, are replaced by Begonias and Fuchsias. Cinerarias and Calceolarias are now raised from seeds instead of from cuttings, as they were forty years ago; and plants such as Palms, hardly seen or known outside botanic gardens, are now generally cultivated, though none was found in any nursery in Scotland prior to 1860. Aspidistra, now so common, was then rare; Ferns also were little cultivated, and glasshouses could hardly be said to be decorated with plants until that period [4]. A few flyacinth, a put or two of Luly of the Valley, or a Tulip new and then, were all that were required.

Edinburgh was supplied from Carstairs; fruit-shops in Castle Street, and the Warriston Nursery contained in these days about a third of the glass it does to-day.

Thirty years or so ago no bouquet was expected to exceed 6 inches across; and this, at a cost of half-a-crown, was expected to satisfy the fairest maid in modern Athens. Twenty-six years ago no flowers were imported into Scotland. The Edinburgh markets were supplied with a few Wallflowers and bunches of Snowdrops in the spring, and a few bouquets during summer, with some pot-plants of Fuchsias, Jasmines, and Musks, with one notable exception—some very fine bushy plants of Myrtle, from 12 to 18 inches high, got up in eighteen months by being grown in tan-beds, by the head of the firm of Dickson & Sons, Edinburgh. Now more cut flowers are sold by Mrs. Todd in a week than were sold in twelvemonths throughout the whole of Scotland thirty years ago.

And yet the cut flower trade in Edinburgh is small in comparison with the same trade in Glasgow, where tons of cut flowers are sold every week throughout the year in the fruit shops and bazaars; different flowers in season, Narcissus, Carnations, Gardenias, Callas, Daffodils Roses, are piled on glass-shelves

Fig. 124.— Howellin Lowerna (Soft creamy-yellow, with minute magenta and purplecoloured spots.)

without a drop of water, until purchasers pity, purchase and give them a drink. The old florists' flowers, Dahlias Carnations, Hollyhocks, Phloxes, Pentstemons, Delphiniums, &c., hold their own, and are still improving. Pansies, Violas, have been greatly multiplied, and are much improved, and some hybrid races have been developed and established by Scotch growers; Mr. Monro himself having a hand in such work, his record being found in the pages of the Gardeners' thronicle and elsewhere. The lecturer naturally expressed some indignation that a Viola Conference in the South should have wholly ignored the Scottish growers, and exclaims that a Viola Conference without Mr. James Grieve, is like attending the recital of our great national drama in the Theatre Royal, Edinburgh, without getting a glimpse of the characteristic face and red whiskers of Rob Roy himself!

Mr. Monro went on to say that the less said of landscape gardening the better. Crowded cities are getting more breathing room in larger parks. Originality of design is lardly to be expected. We may have some mute inglorious Loudon among us, but there are now no more Blair Drummonds nor Castle Kennedys to lay out; or if we did require now and then to lay out a park, or cut a star in the grass, we can copy from Loudon's drawings already to hand.

FRUITS.

With regard to fruit-culture, no drastic change can be noticed, for the obvious reason that all our cultivated fruits have been selected and improved from remote ages. It seems that fruits were cultivated in Switzerland in the Stone period; and Dr. Livingstone noticed some of the wild tribes of Africa cultivating fruits. Pliny mentions many Pears, though none equal to our present luscious fruits. The Vine is perhaps the oldest and most numerous of all fruits. Count Odart says there may be 1000 varieties throughout the world. describes twenty-four in the Crimea, and Burnes twenty in Cabul; ninety-nine varieties were cultivated in the gardens of the London Horticultural Society at Chiswick in 1842. Lindley enumerated 164 varieties of Peaches and Nectarines grewn in England thirty years ago. Of Apples, 877 varieties are named in the catalogue of the London Horticultural Society published in 1842; seventeen varieties of Apricots were described by Thomson in 1835. The varieties of Plums are endless. Gooseberries are not mentioned by writers of the classical period; Parkinson, in 1629, names eight varieties. The catalogue of the London Horticultural Society in 1842 mentions 149 sorts; most of them new varieties, which can be traced to one original species. Strawberries, however, form a notable exception, at least six species being supposed to have been at work in moulding our present races of edible Strawberries, and hence, in part, the explanation of the many new ones.

As to Teehnical Education, the humblest member of this association does not require to he told of the necessity for acquiring specific knowledge in the science as well in the practice of horticulture. This association might also approach County Councils, and others in authority, so as to provide competent horticultural lecturers to young members who are placed beyond its direct influence, and by this means enable them to acquire sound principles without burning the midnight-oil, which too many of the older members had to do in earlier times.

NEW OR NOTEWORTHY PLANTS.

TRICHOMANES RORAIMENSE, Jenm., n. sp.

Root-Stock repent, as thick as stont cord, densely elothed with fine subulate castaneous scales; fronds, 4 to 5 inches in length, 1 to $1\frac{1}{4}$ inch in width, pinnate, dark green, naked, most deusely pellucid, dotted; petioles scattered, $\frac{3}{4}$ to $1\frac{1}{4}$ inch long; rachis flattened, and narrowly winged above; pinnæ numerous, near, horizontal, oblong, rounded, the base cuncate, $\frac{1}{2}$ to $\frac{3}{4}$ inch long, $\frac{1}{4}$ inch wide, margins bidentate and slightly incised, teeth obtuse; veins prominent, forked, striating the surface, reaching the edge; sori confined to the upper half of the frond, one or two terminal on each pinnæ, involucres large, 2-horned, gaping widely; receptacles strong, conspicuously excerted.

Guiana, Mount Roraima; a very characteristic species owing to its peculiar root-stock, large wide-gaping involucres, and long projected filiform receptacles spread in serial order along the sides of the fronds. Gathered by Messrs. Fred. McConnell and J. J. Quelch in 1894, and purchased by me from their assistant, C. A. Lloyd. It has much the largest involucres of any species known to me. G. S. Jenman, Demerara, Nov. 1.

HOULLETIA LOWIANA, (Rehb. f.).

TWENTY-TWO years come last October (as story-tellers would say) will have elapsed since this remarkable species was described by the late Professor Reichenbach in the pages of the Gardeners' Chronicle (1874, p. 484), and very little has been heard of it since. Messrs. H. Low & Co. of Claptoo, who apparently introduced it to cultivation, although Reichonbach believed he "obtained it first in 1870-71—it appeared with Messrs. Veitch, and in the Royal Gardens, Kew"—have retained specimens of it all these

years, and have exhibited it on two or three occasions recently at the Royal Horticultural Society's meetings in the Drill Hall, Westminster. The flowers, as will be seen from the illustration (fig. 124, p. 716), are larger than they appeared to Reichenbach, who stated that a crown-piece would cover one. The prevailing celonr is a soft creamy-yellow, the inner surface being covered with minute purple dots. The petals will be noticed for the sinus on the upper edge, which looks very much as if a bite had been taken clean out of it. The lip is remarkably conspicuous, being pure ivory-white with magenta blotches on the oblong hypochile, and a few dots of similar colour on the bicornute spade-shaped epichile. Unfortunately, but one flower seems to be borne on the short scape, and

ef food to the natives of the East Indies, both when green as well as when ripe. It is closely allied to the Bread-fruit of the Pacific Islands, but usually is not so palatable. Enropeans seldem touch it. The oily seeds, when roasted, are eaten, and are said to resemble Chestauts.

The leaves of the Jack-tree, as the specific name implies, are usually entire. In exceptional cases they are three-lobed; this is specially a characteristic of seedling plants. The lobing of the leaves shows the affinity of the Jack to the Bread-fruit. They both belong to the tribe Artocarper of the N. O. Urticacere, as also do the Figs, which yield a similar milky juice. The flowers of the Lick, produced on the stem and older branches, are monocious-that is,

FIG. 125. - HASSAN JACK - FRUIT: A, DRY PERIANTH OR PERICARD; B, SEED. (From a drawing received from Mr. J. Cumeron, F.L.S., Lid Bagh Gardens, Bang dore.)

this may account for the species not being so well patronised as some of its brethren. I am sorry that it has not found a place in the recent edition of Messrs, Williams' excellent Orchid Growers' Manual. John Weathers, R.H.S., London.

HASSAN JACK FRUIT.

THE Jack-tree of the East Indies (Artocarpus integrifolia) is a handsome evergreen tree about 60 feet high, the trunk having a diameter of 30 to 40 inches. Its dome of dark foliage, with the stem burdened with monster fruits, is perhaps one of the most characteristic features of East Indian village surroundings. The yellow timber is highly valued for carpentry and furniture, and takes a fine polish; it becomes beautifully mottled with time, and then resembles Mahogany. It also yields a yellow dye, little inferior to fustic. The fruit yields a very important article

they appear on different parts of the same plant, They have a somewhat sweet smell. This is in marked contrast to the strong, unpleasant odour of the ripe truit. The male flowers are densely crowded on the outside of a fleshy born like central receptacle, about 2 to 3 inches long. The individual flowers are very minute, and consist of a single stamen and a two-lobed yellow anther. In a section across the receptacle the male flowers are to be seen radiating in a very regular manner from the circumference of the spongy centre. The female flowers are similarly arranged, but on a much larger receptacle, and are so numerous and thicklycrowded as to form an oblong, tuberculated mass of flowers several inches long. Each female flower consists of an oblong, tubular perianth, green and contracted at the mouth. The ovary is provided at the base with a lateral white style passing through the aperture of the perianth. After the ovary is fertilised the mass (or spadix as it might be

called) swells in all directions, and forms a tuberculated, compound fleshy fruit, sometimes weighing from 40 to 60 lbs., probably the largest that is known. The central part is the soft, fleshy receptacle; surrounding this, and radiating towards the circumference, are -(1) the succulent parts of the very numerous, linear, abortive florets; and (2) the enlarged perianths of the fertile florets much swollen, and appearing as brownish-yellow succulent masses, 2 or 3 inches long. These two sets of bodies constitute the catable part of the Jack-fruit. Each seed is completely buried in pulp, and enclosed in a leathery testa. It is usually as large as a Nutmeg: it is destitute of albumen, and composed of two unequal cotyledons.

Good figures of the flowers and fruit are given in the Botanical Magazine, tt. 2833 and 2834, from specimens grown in the Botanic Garden at St. Vincent, in the West Indies. A plant is mentioned to have flowered in 1827 in the stove of the Edinburgh

Potanic Garden

The ordinary Jack-fruit above described is familiar in many parts of the tropics, and is widely enlitvated in the East, from the Punjab to China, and from the Himalaya to the Molnecas. There are numerous varieties recognised by the natives of India and Ceylon. Although common in the latter country, it has probably been introduced at a remote period from India. It was introduced to Jamaica and St. Vincent by Admiral Rodney in 1782, and thence distributed to other countries in tropical America. The fruit is not esteemed anywhere in the New World; probably the single variety there known is an inferior one.

This year a drawing of a very remarkable Jack fruit was sent to me by Mr. J. Cameron, F.L.S., Superintendent of the Lal Pagh Gardens, Bangalore, in Mysore. In a letter dated August 29 last he gave the

following description of it:-

"About a month ago I sent you a photograph and a water-colour drawing of a remarkable Jack fruitat least remarkable to me, as it is the first of its kind I have ever seen , , , . The front and photograph were sent to me from Hassan, one of our hill districts by Mr. A. Watkinson, a coffee planter. His own letters, with two of my replies enclosed, will afford all the information at my disposal. Would you do me the great favour to say what you think of this fruit . . . With your eastern and western experiences you are, of course, well acquainted with the usual form of this fruit, and can offer a valuable opinion."

Mr. Watkinson's account of the tree is as follows: -"There is a peculiar Jack-tree here, the shell which holds the kernel grows on the outside of the fruit . . . Both planters and natives declare it to be unknown in any other part of the district. The native idea is, it was brought hither by a cobra when young ! On March 23, 1896, Mr. Watkinson sent a specimen of the fruit to Mr. Cameron with the following note: "In October last I wrote you about a curious Jackfruit, a specimen of which I am sending by bearer. I think you will find that the pericarp is intermixed with the tubercles or spines, and that the peculiarity is not caused by enlarged spines. I am sending a fruit weighing 91 lb to Mr. Graham Anderson. 1 should have sent the larger one to you, but it is already over ripe, and would be in a state of decomposition by the time it reached you . . . I could send you another later on, as there are five others on the tree only half grown." Mr. Watkinson adds, "I can see no difference in the tree itself from the rest of the trees of the wild Jack." The woodcut (fig. 125) represents the Hassan Jack-fruit one-half the natural size. Its most striking characteristic is the position of the seeds on the outside, instead of being buried, as usual, in capious pulp. There is evidently no swelling either of the receptacle or of the perianth, as in the ordinary lack fruit. Hence the Hassan fruit is probably uneatable. The spine-like processes occupying the area between the seeds are the abortive florets.

Sir Joseph Hooker, who has recently completed his great work, The Flora of British India, has been good enough to examine the drawing of the Hassanfruit, and he is of opinion that it is either an abnormal form, or a new species.

Colonel Beddome, F.L.S., who is credited with

having found the Jack-tree in a wild state in Southern India, expresses a similar opinion in the following words

"The Jack-tree is very common in a wild state in all the moist forests on the western ghats of the Madras presidency. . . . Its fruit does not differ from that of the cultivated tree. Your drawing must, I think, represent a quite abnormal form, unless it be a new species. I can only say I never saw anything like it."

Apparently it is not an abnormal form, as the seeds I learn from Mr. Cameron) are fully developed, and give rise to normally healthy plants. These are now growing in the Bangalore Garden. The matter cannot be carried any further at present, but material is promised of both the leaves and of flowers, the latter in different stages of development. When these arrive it may be possible to come at a more definite conclusion respecting this interesting plant. D. Morcis, Kew. December 5.

MEXICAN ECONOMIC PLANTS.

THE reports of Her Majesty's Consuls and Diplomatic Officers abroad addressed to the Foreign Office, and published from time to time, often contain, as our columns have shown, some interesting facts connected with the vegetation or with the vegetable products of the countries in which the several officers reside, but the reports of Sir Henry Dering on the vegetable products of Mexico which have recently been issued, are the most complete and interesting that have ever appeared in these series. Previous reports have dealt with the cultivation of Caeao, Vanilla, India-rubber, Indigo, Bananas, and Coffee, but the last one is devoted to the Yuca, or Cassava, Pine-apple, Ginger, Chicle or Chewing-gum, Sarsaparilla, Jalap, Liquorice, Canaigre, and Ramie. It is on account of the importance of these plants, and the interest attached to their culture, and because the reports themselves do not come into the hands of many of our readers, that we devote a considerable space to place on record information that would not otherwise be available to our readers.

In introducing the subject of the cultivation of useful plants, Sir Henry Dering says:—"The fault generally committed by Mexican planters is the confining their attention to one kind of cultivation on their land. If several different crops were taken off alternately, as in a system of rotation, or grown in different parts of the land, where soil and climate prove suitable, the planter would find himself in even a better financial position than he generally does now. There is searcely a spot on any estate, whether large or small, in Mexico that is not capable of giving remanerative returns from some plant or another."

Cassava,—The Yuca or Cassava plant is to the peon in the tropical section of the Republic what Potatos are to the poor and working people of Ireland. Yuca is a native of the country, and its rise dates back before the compuest by Hernan Cortes, and it has always formed a great portion of the food of the ancient and present Mexicans, especially those living in Vera Cruz, Daxaca, Tabasco, and Yucatan.

The writer says he has not found the plant growing wild throughout his travels in the Republic, but is of the opinion that if left by itself without attention it will in time entirely die out; hence, one of the reasons for tropical hacendados and peons witching and caving for the plant with so much zeal as they generally do. The people use the plant extensively in their households; the leaves are used as food for the chickens, pigs, cattle, and horses; the root tuber is cooked like the sweet Potato, and made into sweetmeats and preserves. A meal is made from the tuber, which often takes the place of corn and Wheat-flower. It is first peeled, then grated, pressed, sifted, and lastly, dried rapidly in large, shallow, flat iron pans. The heat must be moderate, so as to merely desiccate the meal. Bread can be made from it by wetting the med, forming it into round cakes, and baking them on "comales," or flat, shillow pans, made of red clay. Moreover, a starch of a very superior nature can be made from the tuber by stirring up the grated meal with water, and then passing it through sieves. This is done several times, and the mesh of the sieves is decreased in size after each washing; the reason of this operation is to wash the starch clean, and leave it free from any foreign substance. After the last washing, the water is allowed to rest until the starch settles at the bottom of the vessel, when the clear fluid is decanted, and the starch dried in the sun. After grating and pressing the tuber in making the meal, a juice is forced out; by allowing this to settle, a considerable quantity of fine starch is deposited. The liquid is poured off, and the starch is heated on tin plates, and when the grains swell up and burst, and become agglutinated together, they must be taken off the fire. This is Tapioca, and it is used in debility, impaired digestion, and low forms of disease. It is prepared for use by boiling, wine, nutmeg, and other aromatics being added.

The plant (Manihot ntilissima is known as Yuca in Mexico, and generally as Bitter Cassava. It is of shrubby habit with knotty stems, growing to a height of from 5 to 7 feet, and the roots have large tubers, something like those of the Sweet Potato, six to ten to every plant, and each weighing from 1 lb. to 2 lb. white or of a yellowish colour. The Sweet Cassava (Manihot Aipi, is also grown, but the bitter is mostly cultivated. The best soil for its cultivation is a sandy loam or a loose friable clay, either well drained; the temperature should be not less than 55° Fahr, even in winter. The plant will thrive at elevations from sea-level to 3300 feet south of the city of Vera Cruz (19 N. latitude), and north of this place 500 feet for every degree of latitude should be deducted for the maximum height suitable for its cultivation. The plant needs no shade. If the land selected is covered with timber, it should be entirely cleared in the month of December. The whole of the rubbish is burnt in January, and immediately after the plot is sown with corn in rows. Trenches are made with mattocks or spades, if a plough cannot be used, on both sides of the corn rows. Full-grown woody stems are cut up into pieces having two or three eyes, and 4 to 6 inches long; they are strewed along 12 inches apart between the rows or treuches, and covered with about an inch of loose earth from the trenches, forming ridges between the rows of corn. This must be done before the rains. The leaves of the cuttings will come up in a fortoight, when both corn and cuttings must be weeded with a sharp hoe. When the corn is harvested in May or June the corn-stalks are cleared away, the land weeded again and turned over. In a month corn and beans are sown between the Yucarows, to be harvested in October or November. From the months of November or December the tubers can be dug out for use. They must be excefully removed from the earth and dibrous roots, and then washed. A slip with a tuber may be left on the place for future reproduction, and the stems out to pieces for replanting, or to be used as food for the pigs.

The returns of Yuca cultivation are immense. The yield of an acre contains more nutritive matter than six times the same area under Wheat. The yield can be estimated at 10 tons per acre; 5 tons can be utilised in the household and in food for animals around the house, the balance for manufacturing starch. Extracting the starch will cost 5 dols, for 4000 lb., the product of 5 tous of tubers; so it can be safely asserted that the Yuca starch costs from one-fifth to half a cent per lb. This is sold at the plantations at from 4 to 5 cents per lb., and at the principal cities at 1 dol. 50 cents to 2 dols. an arroba of 25 lb. As eorn brings a net prefit of 3 dols, to 5 dols, per earga of 300 lb., an acre gives a return of 36 dols. from the corn crop, and 140 dols. from the starch, hence, a 10-aere patch will give a cultivator an income of 1760 dols, a year.

Pinc-apple: -With regard to the Pine-apple: Ananas sativa), it is well known that its culture in Mexico dates from time immemorial. Besides the actual fruit itself, a fine wine and vinegar are made from the jnice, and the fine and strong fibre from the leaves is even more valuable than the fruit, as ropes, cables,

twine, thread, mats, bagging, hammocks, and a remarkably fine textile, as beautiful as silk itself, are manufactured from it. It is believed that the fine cloth of various colours used by the upper classes among the Aztees was made of the Pine-apple fibre. The modern Mexicans do not manufacture it much now, except in the Isthmus, where the Zapotic Indians still make a cloth from it and from wild silk. One eause for its disuse is the slow and wasteful manner in which it is separated. It is suggested that the introduction of proper machinery for cleaning and preparing it, would be a source of fortune both to the introducer and to the country itself. It is estimated that one ton of leaves would give from 50 to 60 lb. of good fibre. The report gives careful details on the cultivation of the plant, and the cutting and packing of the fruits, which it is not necessary to repeat here.

timper (Zingiber officinale) is described as being found wild in the Huasteea Vera Cruzana, District of Huachinange, Puebla, and in parts of the States of Guerrero and Chiapas. It is said to have been introduced into America by Francisco de Mendoza, who took it from the East Indies to New Spain about the year 1540. Still, so early as 1547, considerable quantities were sent from the West Indies to Spain. The uses of the dried rhizome, both as a spice and in medicine, are well known, as well as the fresh or green rhizomes, carefully washed, scraped, and preserved in syrup, or cut up in pieces and candied with sugar, are well known as a sweetmeat.

The plant is propagated entirely by division of the rhizomes, which are known as races or hands, each of which is carefully divided into small pieces, care being taken to leave at least one shoot-bud on the eutting; each piece is then planted in the holes at a depth of not more than 3 inches. The cultivation is similar to that of the Potato. Moreover, the holes are filled with well-rotted mannre, and when possible, a thick layer of leaves should be placed over the heles to keep the cuttings cool and moist, besides which, when the leaves rot they will give extra nourishment to the young growing plant. The land must be kept weeded, and as ginger is a very exhausting crop, manure should be dug into the land if the cultivation be kept up for successive years in the same fields. The plant flowers in September and October, and afterwards the shoots will wither (in warm climates soon after), and the rhizones will increase in vigour and size. By January, according to elevation and elimate, the rhizomes will be ready to gather, the process being simply to fork the plant out of the soil, eare being taken not to injure the races or hands. These, of course, vary in size according to soil, climate, and care in caltivation, but they generally average 2 to 3 oz. each in weight. The hands having been raised from the ground, are divested of the fibrous roots, and cleaned of all adhering mould and dirt. They are then plunged for some minutes in boiling water, so as to destroy their vitality, and afterwards dried in the sun, when they become the ginger of commerce.

Ginger is known in two distinct forms, termed coated and uncoated, as having or wanting the epidermis; for in the first the pieces are washed, and simply dried in the snn, when they present a brown, more or less irregularly wrinkled or striated surface, and upon being broken, show a dark-brownish fracture, hard, and sometimes horny and resinous. To produce uncoated ginger, the rhizomes are washed, scraped, and sun-dried, and are often subjected to a system of bleaching either from the fumes of burning sulphur or by immersion in chlorinated lime. The white-washed appearance that much of the commercial ginger has is due to the fact of its having been washed in whiting-and-water or even coated with sulphate of lime. This is by some considered to give the ginger a better appearance. It often, however, covers an inferior quality, and can readily be detected by the ease with which it rubs off. Good ginger when not white-washed is of a pale buff colour, somewhat rough or fibrous, breaking with a short mealy fracture, and presenting on the surface of the broken parts, numerous short, bristly fibres. For ordinary purposes, uncoated ginger is considered the best, the largest and fibest pieces of a pale buff colour both outside and inside, and cutting softly and evenly, are the most valuable.

The returns from an acre of land vary considerably, but when cultivated under favourable circumstances, the crop ought to be 4000 lb. and upwards.

(To be continued).

TREES AND SHRUBS.

PINUS BALFOURIANA VAR. ARISTATA.

In no other Pine of my acquaintance are the needles so thickly produced, so persistent, and so closely appressed to the stem and branches, as in the present species. It is thus rendered very distinct from every other, which is still further enhanced by the open habit, long snake-like branches, and conspicuous light-brown coloured cones, which usually stand erect and near to the tips of the branches.

owing both to the longer leaves, and to the not being so closely appressed to the stem.

The species and its variety succeed in loamy soils that are retentive, if the subsoit is porous, and the exposure to the sun is good. They suffer somewhat from hlight, and the attacks of insects. Bud- are frequently formed in the centre of the tufts of leaves. A. D. Webster.

EASTWOOD HOUSE.

Those of my readers who are acquainted with Rotherham and its neighbourhood, where the atmosphere is at this time of the year usually charged with snoke and sulphur, may well ask tat any rate with regard to horticulture, and more especially floriculture, can anything good be found here? What doubts I might have on this point were effectually dispelled recently by a visit to the well-kept gardens of Alderman G. Neill, J.P., at Eastwood House. My visit was made for the purpose of viewing the fine collection of Chrysauthennums

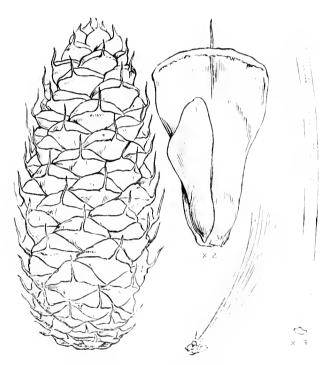

Fig. 126,—Pinus bai fouriana var aristata eones cruam coloured.

The tree is hardy, but of rather slow growth, the annual increase in height of half-a dozen specimens I have examined, and which were favourably situated, being rather more than 6 inches. The leaves, which number five in a sheath, greatly resemble those of l'. Cembra, are more or less appressed to the branches, from 11 to 12 inch loug, dark green on the outer and distinctly silvery on the inner surfaces. The cones are nearly cylindrical in form, 3 inches long by fully I inch in diameter, and consist of obliquely diamondshaped light-brown scales, each terminating in a stiff, upward-pointing dull purple sharp point, nearly a quarter of an inch long. The cones are invariably produced singly, are very uniform in shape and size, and give forth resin in great abundance. The seeds are small, with a wing three eighths of an inch long. Pollen catkins are plentifully produced, they being dull purple of colour, ovate in shape, and frequently 1½ inch long.

P. Balfouriana aristata has the same sort of arrangement of the needles, but these are usually longer, and to a great extent wanting in the silvery sheen for which the inner sides of the leaves of the species are so justly remarkable. The appearance of the tree is more shaggy, less refined, if I may use the expression.

grown here: and used as I am to seeing such collections I was not a little surprised at the excellence of the plants and quality of the individual blooms, and at the admirable and effective blending of colours in the arrangement of the plants; which is a point of the overlooked in setting applarge collections. Here let me say that the greenhouses throughout give evilence of the skill and zeal of Mr. A. White, Alderman Neill's able gardener.

The houses at Eastwool are conveniently arranged so that the owner and his friends can pass at once from the breakfast-room and go round the whole range without once going out into the open air. On leaving the room we passed along a corridor which leads into the large show-house, at present filled with Chrysanthemums. The corridor, too, was furnished with these plants, whilst trained to the roof and down one side was a fine specimen of Lapageria rosea, with its bright campanulate flowers.

Chief amongst the Chrysanthemums I was attracted by several fine blooms of Niveum, with its ivory-white petals. This variety Mr. White tells me is very useful on account of its lasting powers, and it is not so easily affected by the fogs as most of the whites. Mutual Friend, too, was in fine form, thus,

I think, is a variety come to stay it is universally good this year. That cause of dispute, Beauty of Teignmouth, was also very noticeable, as were President Borel, Mrs. Dr. Ward, Lady E. Sanders. Madame Charles Molin, very fine; and Director Tisserand. Also worthy of particular mention as varieties that ought to be found in every collection were Miss Rita Schroeter, Eva Knowles, and King of Chrysanthemums, besides many other well-known varieties. In addition to the Chrysinthemiums grown for specimen blooms, there was a bank of the same plants naturally grown, and let me say here, I have please excuse me, you fanciers of large blooms) still a sucaking love for the Chrysanthemums naturally grown, and think they are far prettier and more useful than the large monstrosities so much the rage now-a days. After leaving the large show house, we passed into a cool-house, just now bright with one or two varieties of winter flowering Begonias, and that always useful and bright double flowered Pelargonium F. P. Raspail, intermixed with Ferns and foliage plants. Next we came to the stove in which is a fine lot of cleanly-grown healthy plants well arranged, consisting principally of Crotons and Dracenas, well colourel; also that fine variety of Rex Begonia, Arthur Mallett, interspersed with Eulalia, Cocos Weddelliana, and Ferns, with here and there Cattleya labiata, evidently at home in this mixed company, as shown by the strong, healthy flower-sheaths, now well advanced.

The arrangement of the fernery is very effective the walls being covered with virgin cork, from which spring fine fronds of Nephrolepis and other kindred Ferns, with here and there the varied foliage of the Rex Begonia showing up well in its green setting; whilst from the top of the house long graceful shoots of Ficus repeas hang in festoons, making the house appear a real bit of Nature such as Ruskin would delight in under glass. Turning sharply to the right, the Peach-cases are reached. From these we pass on into the vinories, both of which ranges give the same evidence of a master-hand that is noticed throughout the whole range of glass.

Before closing this short notice, I should like to mention that Ald. Neill, who has just been for the fourth time elected Mayor of Rotherham, shows his public spirit in no mean way, and during the Chrysanthemum season threw open his greenhouses to all and everyone; and to eater for those who could not go in the daytime, he had the houses illuminated with Chinese lanterns and other lights each night. Sirely there are many large establishments in our manufacturing towns where Alderman Neill's example might be followed with benefit to the public, and without in any way lowering the social standing and respect of the gentleman oxining the place. A. Coleman, Scaler on March Phone, Ratherbar.

FLORISTS' FLOWERS.

NEW CHRYSANTHEMUMS.

Now that the Chrysanthemum season is almost over, the thoughts of growers in general, and of exhibitors in particular, are turned towards making preparations for next year. Those preparations vary according to the different circumstances of the grower, but on one point all are agreed, that is, that a few new sorts are necessary. Now, the difficulty is to pick out the few amongst the many offered by nurserymen who make a specialty of Chrysanthennims. Those of us who are a distance from London, and therefore unable to see the varieties enumerated, look out for those names that are dignified by the mystic capitals F.C.C. Sometimes we pick out a variety that has gained some notoriety, such as Beauty of Exmouth, or we are dazzled by a big price, and buy a Mrs. C. E. Shea, or a Lago Maggiore. Now I think these varieties have never figured very prominently on the exhibition board, and probably they never will. In tances such as these cause the average country exhibitor to look down the long lists of new Chrysanthemums with doubtful eyes, and while admitting to the fullest extent the usefulness of the National Chrysanthemum Society, to wonder whether

something more could not be done to prove the full character of the variety before it is offered to the public.

Trials of vegetables and similar subjects at the gardens of the Royal Horticultural Society at Chiswick are always watched with a certain amount of interest, and if new varieties of Chrysanthemms were sent there to be tested before being offered for sale we might be prevented experiencing disappointment similar to those I have just stated. Besides doing this, I doubt not but that it would increase the popularity of the gardens amongst gardeners in general. In Mr. Wright, the new superintendent, we have one who can grow Chrysanthemums well, and if this suggestion were acted on, I think it would prove to be to the mutual advantage of both buyer and seller. A Country Echibitor.

CHRYSANTHEMUMS.

In order to ensure success in the cultivation of these plauts, preparation should be made for the next year's display forthwith; a period of at least eleven months being required to obtain the finest blooms, and the remaining month for obtaining and preparing the cuttings.

Some cultivators would have us believe that cuttings struck in April will produce good results; but I am convinced by long experience in growing these plants that success is only to be obtained when the plants have a long season of steady and uninterrupted growth. There are, however, various reasons for early propagation, and one of these is the large amount of space required by the old plants during the next three months, to say nothing of affording water, ventilation, &c., all of which entail some amount of labour. On the other hand, the space occupied by a quantity of cuttings is small, by comparison.

The present month and onwards till the middle of the next, forms the best period for the propagation of the cutting of such plants as are intended to produce large flowers. Where plants are required for purely decorative purposes in the glasshouse, or when not very large blooms are sought for, the cuttings need not be struck so soon, a quantity of bloom being usually of more consequence in such plants than very fine quality; and the end of the month of January, or early in the following month, is sufficiently early for these. It is important that each cutting be about 3 inches in length, not very succellent, nor on the other hand weak or wiry, as such seldom make fine growth; and shoots which grow out of the bard stems should not be taken, these being apt to flower prematurely, sometimes as soon as the young plants begin to grow-still, if a variety be new, scarce, or rare, such improper shoots must be taken. As soon as the flowers have passed, enttings should be taken of any variety that produces shoots plentifully, taking them down to within a few inches of the soil. The stems of shy-growing, new, or scarce varieties, should be cut back not lower than 1 foot from the soil, more space being thus afforded for the production of lateral shoots, some of which may serve as cuttings, although stem-shoots are not so good as those which push up from the roots, or come from the collar. When a plant has done flowering, and is cut down, place it in a cool greenhouse, or other structure from which frost is excluded, standing it so that it gets plenty of direct sunlight. Some varieties throw up shoots very freely, that it becomes necessary to thin out the weaker ones to prevent drawing. A very wet soil causes a sickly appearance, and should be avoided, affording no more water at this season than a plant whose work is over for the present requires. In the case of any new or scarce variety which breaks indifferently, place them, after seeing that the drainage is right, on a gentle bottom-heat, in a house having a temperature of 60°, and syringe oceasionally with tepid water. Aphides are very troublesome at times, causing the curling up of tender leaves, and, as a consequence, checking growth. The best means of ridding the plants of these pests, is to dust the affected parts with tobacco-powder, or to fumigato with tobacco on two consecutive nights.

The propagation of Chrysanthemums from cuttings

is an easy matter if a few simple rules are observed : and one of the most important of them is a coolhouse or pit from which frost is excluded, which has a temperature at night of 40°, and by day of 50°, and in which may be placed on one of the stages a close garden-frame. In preparing this frame, let the bottom be covered with slates, and on these place a layer of fine coal-ashes to make it air tight, and afford a cool, moist medium, on which the cutting-pots may stand. In making the cuttings, trim the leaves from the base, and cut the shoot square across below a joint. Some gardeners remove the buds from the lower part of the cuttings, thinking they thereby prevent the growth of suckers. This is, however, not advisable, as suckers can be readily removed when they appear, if thought objectionable, and they become shoots fit for cuttings. Some growers strike the cuttings in a cold-frame in the open air, but my reason for prefering a cool-house is, that much valuable time is sometimes lost if the winter be a severe one. I have seen cuttings frozen hard in the pots for a fortnight; this does not kill them, but they make no roots, and therefore time is being lost. Others strike the cuttings on a shelf in a cool-house. Here the leaves flag very much, and rooting is greatly retarded; they ought not to flag in the least degree. It is a common practice to put five or six cuttings round the edge of a 41-inch pot, and they strike readily enough in this way, but when the plants are potted off, a check is given by disentangling the roots, which is very undesirable. If one cutting is placed in a small pot, no such check occurs in repotting. This, I consider, is good reason for putting cuttings singly into deep pots, narrow in proportion to their depth, in which the roots naturally go downwards, and a larger number of the pots can be placed in a given space than others of the same capacity, i.e., wider, but not so deep. The kind of pot indicated, measures 2½ inches inside, and they are called, in garden par-lance, "thumbs." A cutting pot should be either new or well cleaned, and one crock in each pot affords sufficient drainage, if it be covered with the rougher siftings of leaf-mould. The pots should be filled with a compost consisting of about equal parts of loam and leaf-mould, with one-eighth of the whole of coarse silver-sand, all being thoroughly mixed together. Make the holes for the cuttings with a blunt ended dibber; now be sure that the base of the cutting rests upon the soil; afford a gentle watering with a fine rose can to settle the soil, and place on one side in a place where there is no draught to dry the leaves somewhat before placing in the frame. Having put the pots in the frame, keep the lights close till roots are formed, with the exception of airing the frame for an hour every morning, so as to get rid of the moisture in the air. In the evening if the glass on the inside has much moisture condensed upon it, it should be wiped dry in order to prevent loss of cuttings by damping off. No shading should be afforded. In about one month some of the cuttings will be rooted, the varieties which grow the stronger being the earliest to form roots. A small quantity of air should then be admitted by tilting the lights slightly at first, then increasing the amount till they are removed entirely. Those which are rooted should be placed by themselves, their requirements, in the matter of ventilation, not suiting the slower-rooting varieties. To deprive a rooted outting of air, and confine it similarly to those that are unnooted, is to cause a loss of stockiness, and induce lankiness, which no after-treatment will quite But little water is required in closed frames; still, the soil in the cutting-pots must be kept sufficiently moist to prevent the flagging of the cuttings, and to induce the forming of roots. E. Molyneur.

CASTLEWELLAN.

Concluded from page 684).

The Conferes.—These trees form the more conspicuous glories of the place, and examples of rare and commoner species are to be found of a size and symmetry not to be surpassed, and seldom equalled, excepting perhaps at Fota, see p. 363. It must suffice to note only the finest or the rarer examples under each section. Of Picea, a perfect specimen of Morinda was noted; Abies magnifica, 30 feet high, is fine in every respect.

This tree stands in a bay on sloping ground, with dense shelter from trees at the back of it. Of Tsuga Mertensiana (Albertiana), a fine specimen 40 feet high was noted; also another planted years ago, which has made excellent progress; one of Abies bracteat: is doing very well, which is rarely the case elsewhere. A. concolor violacea, 15 years old, is now a perfect specimen 20 feet in height; the blue-green of the peedles is very striking in big plants. An Abies Hookeriana, said by the late Andrew Murray to be "an alpine tree with a spreading irregular habit," is here of a nice, fairly compact habit, the needles blue-green instead of grassy-green, as stated by some authorities; the tree is 25 feet high. Abies Webbiana was noted, a tree 25 feet high; Picea polita, planted in 1884 by Lord Annesley's eldest son, is a tree now measuring 24 feet in circumference and 15 feet in height-a good specimen. Abies Veitchii, a young tree, is making good progress; Picea pungens var. argentea is a pretty type of lawn tree, with bluish-green needles. Of the handsome Fir Abies Nordmanniana, an example 50 feet high, a perfect specimen in every point, was remarked. The Sequoia (Wellingtonia) which is the subject of our illustration (fig. 128, p. 725), was planted in 1856, and it now has a girth of 24 feet at the ground-level, and at 3 feet high, of 19 feet; the height being 69 feet.

In clearings in the wools we noted the following: Abies Lowiana, of perfect form, is 45 feet high, and like all of these Conifers, clothed to the ground; 100 feet high, than which few larger are to be found a grand example of Pinus insignis, here perfectly hardy; a Pseudotsuga Douglasii, perfect as regards shape, in the country; a good Pinus Muglio, au example of great dimensions of Araucaria imbricata in cone. Two Abies nobilis were remarked, one of which was 40 feet high, and bearing cones at the top. Thuias and Retinosporas, Juniperus and Cupressus abound, and there are numerous fine examples on the lawns. A tree of Thuia gigantea (Lobbi) is, we should imagine, almost unequalled for height, it being 40 feet, and large in proportion; T. g. atrovirens, a dark green foliaged form, makes a beautiful symmetrical specimen 35 ft. in height. A specimen of Thuia Vervaeneana was 15 ft, high - a beautiful example; one of Thuia dolabrata measures 20 ft. in height by 15 in breadth. The pretty-looking T. Lawsoniana lutea (fig. 127, p. 721) forms a plant 15 feet high, a perfect specimen, the soft yellow variegation of which, unlike that of some others, is bright at all seasons; Cupressus Nootkatensis allo variegata is a good-sized plant. Another coniferous plant with constant yellow variegation is C. Nootkatensis var. lutea; the specimen bad a height of 6 feet. A handsome specimen of Podocarpusandina was also remarked. Cupressus Lawsoniana gracilis aurea is a plant with foliage of a deep yellow tinge, quite unique, and of Irish origin, having been bought of Mr. Davis, nurseryman at Hillsborough; the plant possesses three main stems. A specimen of C. erecta viridis was noted 25 feet high. Of Juniperusthere are several, including d. sinensis albo-variegatus, a nice specimen of the Nepalese J. recurva, a very pretty, distinct-looking species, with drooping foliage, 30 feet high, and 36 feet in diameter; and J. Eurgeoni, a plant raised here from seed sent from New Zealand. Retinosporas are found in great variety of forms, and they are kept under distinctive names, although it is a well-known circumstance that all of them may, at times, be found on one and the same specimen. A specimen of R. plumosa aurea measured 10 feet in height, and 12 feet in diameter of the branches; R. filifera is of the same dimensions; R. f. variety anrea is a smaller plant; R. tetragona var. aurea is a small plant, with pleasing yellow-tinted foliage. The Larch, not lending itself generally to garden decoration, was seen only in the Japan species, L. Kempferi, a tree of 6 yards in diameter and 6 feet in height, and in perfect health. The Irish Yew, as is quite belitting, makes extremely fine trees, and good use is made of them.

THE WALLS.

Before leaving this arboretum, we cannot omit to notice the wall of the kitchen garden, which on the side next to the pleasure-ground is profusely covered with a number of creeping plants, and those which enjoy the protection afforded by a wall. There is here no formal training, and most of the plants are allowed to grow out to a distance from the face of the wall with but little appearance of the restraining hand of the gardener.

Dahlias, and some herbaceous perennials; and separating it from the wide walk, a broad strip of turf, on which large round-headed standard Portugal Laurels are arranged in a straight line, at a sufficiently wide distance apart as not to greatly shade the border or the wall overmuch. Some might condemn the use of

Fig. 127.—Cupressus lawsoniana var. lutea, at castlewellan. (sie p. 720.) (From a photograph by the Earl of Annesley.)

A sort of floral connection is made from one to the other for a great part of the length, by the glowing scarlet-flowering growths of Tropacolum speciosum. Any flatness of the facing of climbers is obviated by the use of Garrya elliptica. Crategus pyracautha, and C. p. Lalandei, &c., as outstanding buttresses, at regular distances apart. In the front of this wall is a wide border for flowering plants, mostly Gladiolus.

these objects of the topiarist's art in this part of the grounds, but they appeared to us in perfect keeping with the stately-looking Comfers, and the straight wall and walk alongside which they ranged. The latter connects the gardeners' cottage with a terrace on which the numerous glasshouses are built, and from which fine views over the arboretum are obtained.

Within the boundaries of the kitchen garden borders

are set apart for testing rare trees, shrubs, and climbing plants, and here are Sciadopitys verticillata, Cupressus macrocarpa lutea, Diplopappus filicifolia, Coprosma Cunninghami, Urtica nivea, the Fern-like Libocedrus Donniana; L. chilenensis atro-virens, whose young growths have a yellow hue; a species of Myoporum; Pinus Montezumæ, which seems likely to do well; Quercus cuspidata, a distinct, evergreen species; Widdringtonia Whytei, from the Kilimanjaro Mountains, a two year-old seedling, 2 feet in height, from seed sent from Kow. There is apparently, said Mr. Ryan, a dwarf form of this species, a plant of the same age as the rest being only 6 inches high. Quercus bambusæfolia is here a hardy tree, although in England and the colder parts of Ireland and Scotland it is tender

We might greatly extend our notes of plants in these borders, but enough has been said to show the interest felt by Lord Annesley in the introduction of plants capable of imparting greater interest to gardens in the milder districts of these islands. His lordship's energies are by no means confined to the garden, for we found in Drumbuck Wood, an old plantation of Holly and Oak, a short distance from the latter, a variety of experiments are being carried out in planting half-hardy things, but in truth, it must be said, not all of them successfully. The Oaks are stagheaded in great part, showing the effect of excess of water in the soil, and therefore not likely to improve; whilst the Hollies are gigantic specimens, the girth of one being 3 feet 6 inches at 3 feet from the ground.

Bamboos have been planted in groups, and they are doing well. A pond has been made for Water Lilies, and as a collecting place for surface water. In this pond, some plants of Nymphora Marliacea were in bloom. Some Conifers were also noted here, but not in the low moist ground. Amongst them are Cryptomeria inponica spiralis, with very dark green foliage; C. j. Lobbi, a variety of an upright habit, and on that account less pleasing than spiralis; Thuja gigantea a rovinces, which trees, when growing in proximity, show great differences in foliage; the so-called Pinus radiata, a garden name, we take it, for a form of P. insignis out of a batch of seedlings of which it was obtained; the needles radiate all round the shoots, and their colour is greyish-green.

In the Scots Pine Spruce Fir and Oak woods, which exists on the hilly land skirting the lake, and much further, many choice Conifers are found in clearings made for them. Their height in many instances reach 70 to 90 feet, and having been afforded an ample space from the time they were planted, their proportions and contour are perfect.

GLASS-HOUSES.

The gardens are well provided with glass-houses of modern construction, which are mostly collected together on a terrace. A Water-Lily-house contained plants of Nymphicas chromatella, Leydeckeri rosea, Marliacea rosea, dentata alba, and carnea. Along the roof trail the stems of two plants of Gloriosa superba, which flowers freely in its season; an Aristolochia sacenta was in bloom. Other plants not often seen in gardens were the yellow-flowered Stigmaphyllum ciliatum, very free, and useful for cutting; Brownea bybrida, from the East Indies; and Ecaumontia grandiflora.

A small stove contained plants of Phyllanthus nivosus, the useful Phrynium variegatum, Codiæums in variety, Dracæna Youngii, and others; Pandanus Veitchi, Aglaonema versicolor, with very distinct leaf variegation; the beautiful green-leaved Begonia smaragdina; Marantas with handsome foliage, Sonerila Silver King, Caladiums, &c.

An intermediate-house contained a plant of the handsome Schubertia grandiflora in bloom; Pellionea Daveaueana, nice panfuls; Banbusa Fortunei, B. Tai-chiku, Ficus lanceolata, with long leaves 2 inches wide; the seldom-seeu Doryanthes Palmeri, Codicum discolor, whose leaves on the under-side are of a red colonr and green above; C. ancubæfolium, Bentinckia nicobarensis, landsome and distinct; Heliconia metallica, Maraota Warscewiczii, a variety which stands employment in the mansion without suffering.

In a house devoted to the cultivation of Codiæums, of which there is a great variety, were plants of Leea amabilis, and one of Gmelina hystrix; also Heliconia illustris var. rubricaulis, which has a handsome leaf 6 inches wide and leaf-stalk 3 feet high, colour dark reddish-green; Aglaonema costatum, with dwarf, clean growth; Co-tus igneus, a species that is nearly always in flower, the colour of the flowers being bright orange; Maranta Veitchi in quantity, it being useful in house decoration; M. Lietzii is a species of dwarf habit, and oseful for furnishing vases; and M. leopardinum is somewhat similar. Numerous Alocasias in variety, Ericenema Sandersi, the fine-habited Dracena recurva; Adiantum macrophyllum striatum, a very handsome Fern, which every one should possess; Tapeinotes, Caroline, Curmeria Wallisii, Draceuas argentea, striatı. & c.

The cool Orchil-house showed a number of species and varieties, which form the beginnings of a collection, and the plants being mostly new importations, some pleasant surprises may be in store for the owner. Trachelospermum jasmin ides variegation, although hardy outside, is employed as a climber on the roof of this house. Another rare plant here is Quisqualis indicas. The Cattleya-house contained plants of C. Percivalliana, C. Trianei, C. Mendeli, Ladia purpurata, Renanthera coccinea, Cymbidium Lowinium, Vanda Amesiana, V. Roxburghi, numbers of species of Dendrobium, Oncidium Forbes i, C. Trianei albi, &c. The collection is a good one, and much discrimination is shown in making additions.

The "Rock-house" deviates in its management and plunting from those usually seen. The central stage or bank is covered with a bold looking rockwork, which in the spring is mule gay with the flowers of Daffodil Countess of Annesley, 6000 of which are forced, besile large numbers of other varieties. In this house we remarked Begonias Rex, Countess of Annesley, and Thomas Ryan; Passiflora Constance Elliott, P. edulis, Lapageria rosea, L. r. alba, Mutisia decurrent, and Bomarea Carderi.

A vinery was visited, in which was a collection of Bamboos which had come from Japan, and 700 plants of Maidenhair Ferns. In a Melon-house we found Gardenia grandiflora planted out in a heated bed; and in the same house were numbers of Gloxinias and Streptocarpus hybrils. Other plants and forcinghouses exist, twenty three in all, we believe, but our time was short, and we were obliged to bid adien to Castlewellan, and Lord Annesley's tircless and enthusiastic gudener, Mr. Thomas Ryan, without having seen their contents.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

The Scakale Quarter.—If the decayed leaves have been cleared off the crowns, there is no alvantage in allowing the roots which are to be lifted for forcing to remain any louger in the ground, and by lifting them forthwith the land may be manured and dug for another crop. The roots, when lifted, should be got out of the soil as entire as possible, for the reason that any bit of root left in will grow into a plant. The roots which possess crowns strong enough for being forced should have every rootlet removed about half an inch from the base, and be then had in, closely together, with the crowns level with the soil, in a border or heap of soil, affording them a slight covering of litter in trooty weather. This sort of protection permits of the roots being easily lifted when required. The thongs or small roots should be placed in a heap and covered with soil or leaves for the time being, outling them into 6 inch lengths for planting in March. The thickest or crown end in making the sets should be cut squarely across, and the lower end in a sloring direction, so as to afford an indication to the planter which endhe is to keep uppermost. When made pack them in shallow boxes in any kind of sandy soil,

Jeru alem Articloke.—The tubers me, this year, source'y so large as usual, owing to the summers drought. If the crop, for certain reasons, has to be lifted, this may be done forthwith without detrinent to the tubers, if they are stored on a damp floor or maclamp out of doors, the last-named being best for

keeping them fresh and firm. If the land be not in need of trenching for some ether crop, the tubers should be allowed to remain in the ground for a period of ene or two months longer, covering a portion of it with litter to facilitate digging out in frosty weather. The medium-sized, well-shaped tubers make the most suitable sets, and a sufficient quantity of these should be selected and pitted. The Artichoke with a white tuber is of better shape than the purple, and having less deep eyes, may be prepared for tuble with less waste.

Chinese Artichoke, or Crosnes (Starbys tuberifera) may be treated similarly to the above. The crop, with us, is a very light one this year. These little tubers, it may be here stated, should not be washed until just previous to cooking them; and when sint to a distance, they should go just as they are dug up, or the colour will change from white to a dirty brown, which colour is retained when cooked.

Brocoli.—The recent nip of frost, and the biting cast winds, although only of short duration, have injured the heads of those Broccolis which had not been protected in some manuer. At Dropmore the self-protecting autumn varieties are still coming into use, and should the weather keep fairly open; Snow's Winter White will soon be fit for use. The Broccoli quarters should be examined every third or fourth day, and any plants which have developed small heads should be lifted, as previously advised, and replanted closely together in cold pits or other place that can be easily made seeme against frost.

Materials for Hoteleds --Where large quantities of fallen tree leaves are collected, it is an easy matter, if some stable litter be obtained, to make het-leds for a variety of uses, which will retain a good degree of heat for a long period of time. Heaps should be made of these commensurate with the requirements of the garden in the matter of bels, and linings for the same; preparing them by mixing and turning several times. The leaves should usually form two-thirds of the mixture, and they should conest of those of the Oak, Beech, Hornbeam, and Chestnut.

Manuring.—When the ground is sufficiently frozen to carry a cart or whoel-barrow, manure of various kinds should be heaped upon all vacant plots of land, covering the heaps with a small quantity of soil if it cannot be dug-in in a short space of time.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinto 1, Tring.

Burder Curnations.—These which were planted out some few weeks ago are new on the move; in fact, in some instances to much so, and it may be advisable, in consequence of this untimely growth, to afford them a mulching, it being preferable to do this betimes, and not to wait until the ground becomes frest-bound. The best mulch consists of a mixture of rotten stable-manure and leaf-mould, taking care not to use so much as will choke the plants.

Bedding Plants should not be afforded much water, Bedding Plants should not be afforded finish water, it being safer to maintain a dryish condition of the soil for a few weeks longer. Those Pelargeniums that were lifted and potted, having now fairly started into growth should be cleared of decaying leaves or flower stems, &c., and afforded a temperature of 60, in order that shoots fit for furnishing cuttings may develop. Keep cuttings of Pelargoniums struck in the autumn months in a house having a warmth of 50' till the time arrives for patting them singly, when a rise of 10° to 15° may be afforded them. The stock of tender carpet-bedding plants, viz., Co'eus, Iresine, and Alternanthera, should be kept in a temperature of not less than 60° to 65, otherwise many failures may yet occur, which will mean a considerable addition to the work of propagation later on. Belding Lob-lias are still frequently propagated by cuttings or by divisions of the plants in the autumn: cuttings or by divisions of the plants in the autumn; but it so use times happens that, for some reason or the other, these fail to make satisfactory progress, so that it is wise at about this time of the year to examine the stock of plants, and if any doubt exists as to the supply for the forthcoming season, no time should be lost in making a sowing of seed. The plants raised in this manner are strong and far preferable to those raised from seel sown in the spring of the year. Those who find a difficulty in obtaining a good strain of Lib has, will find in Sutton's Dwarf Royal Purple one that is good in every respect, it being distinct, and in colour of a rich purplish-blue, with a conspicuous white eye, and of compact habit; and notwithstanding the dry season, it retained its foliage and continued to bloom throughout the summer. Labelia seed being exceedingly small, requires careful sowing on an even surface of light, rich soil, which should be watered prior to the sowing of the seed, or many of the seeds may be buried too deeply. After sowing the seed and pressing them with a smooth piece of wood, a light sprinkling of fine sand or very finely sifted soil may be given, and the pan or box cevered with a sheet of glass, and removed to a temperature of 50° to 55°, where germination will soon take place.

The Hardy Fernery is a capital place in which to plant surplus bulbs. In fact, in many gardens this place s usually included in the ground to be planted, and it is certainly worth considering, when fer a small outlay this otherwise bare spot in the pleasure-grounds in the early part of the year may be made bright and cheerful-looking by detting about of some of the many early flowering bulbs; and although it may not be desirable to make a spring garden of the fernery, yet the planting of a few of the various spring-flowering plants, also such as Alyssum maritimum, Arabis in variety, Aubrietia, and similar plants among the Ferns will enliven the place until such times as the latter have made new frends. Where the planting or construction of a hardy fernery is contemplated shortly, advantage should be taken of natural slopes, banks, or gleus, where not only a far better effect will result, but may be obtained at a minimum entlay of labour and materials.

General Hock.—When gravel-walks and drives are not rendered hard by frest, they are always in need of rolling in the winter. If mess-grewa, the surface most be scraped with the hoe, and scrubbed with a stubby broom; or if in a very bad state from this cause, the substance of the walk should be turned or pricked up with a fork, and some small quantity of fresh gravel spread over it, after which it should be rolled down to a hard, smooth surface. The bare spots often observed under trees with dense heads should be re-turfed in mild weather, beating and rolling the newly-laid sods. The raking-up of tree leaves, and collection of refuse generally, should be finished, and the flower-garden and pleasure-grounds made tidy as far as circumstances will allow.

THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorking.

Dendrobiums .- Attention should now be given to the decidnous and semi-decidnous species of Dendro-binurs. The handsome golden-flowered D. chrys-anthum now starting into growth should be forthwith place I well up to the roof in the East Indian-house, in the lightest available position. Although the young growths may appear to be starting strongly, the cultivator should not be tempted thereby to afford it much water, or the young green shoets will quickly decay. Before the new growths begin to send forth roots, much of the eld compost should be picked out and replaced with peat and chopped sphagnum-moss in equal quantities, and until such time as the young roots have made some amount of progress, merely the surface of the compost should be kept moist, but afterwards as the growths lengthen the quantity of water may be gradually increased. It is new advisable to examine the placts of D. Wardianum, D. erassinode, D. moniliforme, D. anreum, D. heterocarpum, D. nebile and its varieties, also the garden hybrids D. micans, D. Wardiane-japenieum, D. Aspasia, D. Cassiope, D. Aiusworthii, D. Demiuianum, D. Schroderiauum, D. Cybele, D. splendidissimum, D. Dulee, D. June. D. melanodiscus, and D. chrysodiscus, the greater number of which will be showing their flower buds, and may be brought frem their quarters in which they have been resting into the intermediate-house, where the night temperature is usually at this season kept about 55°, there to remain till the flowers are about to expand, when, if then removed to a light position in the East Indianhouse the flowers will open in their proper tints. From the present time water should be applied at the root at rather long intervals of time, any undue excitement at this season sometimes causing the growths now visible at the base of the pseudo belbs to break, and thus prevent the flower from arriving at perfection; too great a degree of wetness in the compost also causes the old roots to decay prematurely. In houses having a moderately moist at no-phere, the plants may make good progress without affording them any water. It is prudent for beginners in Orchideulture to examine each p'ant daily, and as soon as shrivelling of the skin of the pseudo-bulbs is noticed, to afford that plant a mo lerate amount of water. Plants which are placed in the warmest house may have a slight overhead syringing with tepid soft-water on sunny days, and if this be

judiciously afforded, it will tend to the more free expansion of the flewers. The species D. Wardiauum, D. crassinode, D. Wardiano-japonicum, D. micans, and others that push up new breaks from the base of the current season's flowering growth before the flowers open, require very careful treatment, or these breaks will grow toe rapidly; but if the plants are kept in a moderately dry condition, and cool as well, the new breaks will remain almost stationary till the spring, when they will develop vigorously. Where many D. nobile are grown, flowers may be obtained during several mouths by placing those plants earliest matured in a cool house as soon as the growths are fully made up, bringing them into gentle warmth as flowers are required. Species which make late growth, viz., D. Parishii, D. rhodopterygerum, D. Bensoniæ, D. superbum (macrophyllum). D. albo-sanguineum, D. secundum, having completed their growths, should be kept in the Catt leya-house or the cooler part of the East Indian-house during their season of rest; and all of them should be kept as dry as possible at the root. Plauts of the beautiful D. Phalenopsis, D. bigibbum, D. Statterianum, which may have passed out of flower, should likewise be at rest in a house the temperature of which rarely falls below 60°. The plants will need just as much water at the roots as will avert undue shrivelling. D. Falconerii, and the splondid hybrid D. Venus which was obtained from that species, should not be subjected to a severe drying when at rest, as, although such a kind of treatment results in abundance of flowers, the after-growths usually develop thin and weak—at least, at the first.

Angreeums.—The West African A. pellucidum, now showing its pendulous flower-spikes, should be carefully examined every day, and water afforded accordingly as the surface of the sphagnum-moss towards the sides of the pot or basket is wet or otherwise, for if ueglected in the matter of moisture they always push their roots downwards into the compost, and in some cases the plant dies rapidly. The plant named requires plenty of water at all times, and a warm, moist atmosphere, like that of the East India-house to grow in, where it should be carefully protected always from direct sunshine. The winter-flowering Angræcum sesquipedale, now showing its flower-spikes, should be closely examined every day for a small species of yellow thrips; these tiny insects are very partial to the flower-bads, and if not eradicated as soon as observed, they quickly spoil them. The best means to employ against this pest is to vaporise the house with XL All every week from the time the spikes show till the flowers fade.

Sophronitis.—The small and charming Sophronitis grandifiera is growing in the cool-house freely, and will soen unfold it glowing flowers. The plants should have plenty of water at the root at this time, but care taken not to fill the young growths with it or the bloom-buds perchance will decay. The plant does best in shallow pans, suspended close to the roof, very necessary at this season, the young growths requiring all the light possible, but in summer the plant is kept in a healthy state when placed upon a stage with plants of Odontoglossum crispum. the flewers are open, do not touch these with water, and they will retain their freshness for a very long period of time. Repotting may be done when growth commences, or immediately after the flowers fade, and a small quantity of peat and sphagnum-moss is all that the plant requires to root in. Sophronitis cernua is now in bloom; it is a plant like S. violacea, appearing to thrive in a trifle warmer temperature than S. grandiflora.

THE HARDY FRUIT GARDEN.

By G. Woodgate, Gardener, Rolleston Hall, Burton-on-Trent.

The Pruning of Wall-trees.—The pruning, cleaning, and training of most kinds of wall-trees will need to be continued on every favourable opportunity until the work is completed. Release all the branches from the walls, and where nails and shreds are used, all those that are fit for use again should be selected and cleaned. The shreds may first be soaked for a short time in boiling water, to destroy any insects or their eggs that they may contain. The old nails should be placed on a shovel and held over a fire until they are red hot, and when partially cooled plunge them in linseed oil, and dry them before using. The practice of removing the whole of the branches from the walls every season greatly facilitates the work of pruning and cleaning, and there is less risk of loss of main branches, by their being cut through by ligatures. Such injury usually occurs when the branches are secured with tarred string, which is not r-moved annually. If the trees were

disbudded and pruned during the summer, pruning as was advised in former calendars, there will be no need for much cutting. Any unhealthy branches however must be removed, and in their stead a sufficient number of clean and well-placed young growths laid in. Old trees have a tendency to acquire more spurs upon the branches than there is room for, and the worst placed and longest of these should be removed with a sharp pruning-saw; afterwards paring the wounds smoothly with the kuife, and pruning back the current season's growth upon the remaining spurs to two or three eyes. This, however, does not apply to the Morello Cherry. As soen as the pruning completed, let all the main branches be well brushed over with Gishurst compound, or soft soapywater, at a temperature of about 120°; when finished, tie the branches loosely into bundles, to allow the wall to be brushed with a stiff brush; all holes made by the withdrawing of the nails should be stepped up, and the walls syringed with soft-soap and petroleum—one pint of petroleum to four gallons of water. If red-spider was observed during the summer on any of the trees, ald a good handful of flowers-of-sulphur to each bucketful, and keep the whole well agitated during use. In refixing the branches to the walls, whether by shreds or raffia, take care to leave sufficient room for the swelling of the branches during the next year; and when driving in the nails, be careful not to let the hammer strike the wood. By whatever method the trees are trained, endeavour to fix the branches in as straight a line as possible, and sufficiently distant from each other that the future crop of foliage and fruit may have ample space for development. When training is completed, spray the whole of the trees with an insecticide, to destroy insects or their eggs, which may have escaped the application of soap-suds.

Marella Cherries produce their fruit on the wood of the preceding season's growth, and on spurs on the older wood; therefore the young wood must be laid in at its full length, and much closer together than is advisable for those of other fruit-trees, with the exception of Peaches and Nectarines. Remove the old fruiting-wood where necessary, to make space for young shoots; thin out the spurs where they are too numerous, and shorten back those remaining as much as may be necessary.

PLANTS UNDER GLASS.

By JNO. McINTURE, Gurdener, Woodside, Darlington.

Ciloxinias.—If a large quantity of Gloxinias be grown, a few of the tubers which ripened and were rested early may now be removed to a warm pit, and allowed to start into growth, so that they may bloom about February. These had better not be potted, but just grown-on in the pots in which they bloomed last season, for if the tubers are shaken out at this season, and a brisk heat is not available, they are apt to rot before new roots are made. Remove all the loose soil, howover, and top-dress with fresh compost. After the plants are well started, a sprinkling of Clay's Fertiliser or Thomson's Manure may be given occasionally.

Store Pleats.—All specimens of stove plants that have done service during the summer will now require a season of rest, but a mistake is made by withholding water suddenly from any plants that it is wished to see entirely at rest. The practice of depriving plants entirely of water during a certain period of the year has been proved to be an erroneous one. Often are specimens of Clerodeudrons, Bougainvilleas, Allamandas, Ixoras, and other species, as soon as they have served their immediate purpose, placed in vineries, Peach-houses, and other cold structures, where little or no attention is paid them until they are again required to be started into growth. In most instances this practice is ruinous to the health of the plants. The amount of water given should be gradually reduced before removing the plants to a cooler house, and at no time should they be subjected to a lower temperature than 50° at night, nor should water be absolutely withheld. Sufficient is required to keep the wood from shrivelling, and theroots from perishing.

Eucharis.— Remove some of the potfuls of Eucharis to the warmest house with a view to obtaining blooms at Christmas or soon afterwards. Bulbs which flowered in the summer and have since made strong growth, bloom very readily at this scason if afforded sufficient heat and moisture. Experience tells me that Eucharis are better if not plunged in bettom-heat. When the plants are started, a little good fertiliser may be afforded them with advantage.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

Peaches and Necturines in the Eurly-house. As the buds advance, air in moderate quantity should be afforded at all times by means of the upper ventilator. Under this sort of treatment, the blossoms will develop strongly, which is an essential for a good Endeavour to maintain a temperature of 50 in the daytime by artificial means, with an advance of 10° during suushine. Do not exceed 45° at night excepting in very mild weather; when cold, it may fall to 40°. If fermenting material be used on the borders, turu this occasionally, and supply additional fresh material as the warmth declines. The surface-roots will be stimulated into growth by the warmth afforded by the bed of fermenting substance, and the warmth of the house maintained without fire-heat for When the blooms open, cease syringing the trees, sufficient acrial moisture being provided by damping the paths, borders, &c., twice a day. Should the flowering-wood be thickly set with buds, a portion may be removed by drawing the hand the reverse way to the growth along the back of the shoots next to wall or trellis; the remaining flowers will be sure to benefit by such timely thinning, and time be saved in thinning fruit later on.

Succession-house.—If this is to be started, at or about the New Year, it will probably be the earliest house in many gardens, and should have the pruning and cleansing completed as soon as possible, the shoots, &c., laid in sufficiently thin to allow of the full development of the foliage later on, as upon this will depend, in a great measure, the flavour and proper ripening of the crop of fruit. Keep the house as cool as possible for the present, with plenty of air admitted night and day. Examine the border if in the house, and supply water, if needed. To old or weakly trees a good soaking of rather strong liquid-manure will be of immense benefit.

Making or Renewing Vine Borders.—Where new Vines are to be planted in the spring, this is a suitable time to prepare the border for them, so that the soil will have time to settle previously. A great point in successful Grape-growing is to have perfect brainage, more particularly in gardens that are lowlying, or where the subsoil is wet. In such cases it may be advisable to put a layer of concrete over the bottom, or even to form the border above the level of the surrounding soil, so as to ensure satisfactory drainage of the border, and its resulting warmth. concrete be decided upon, a thick layer of brickbats should be put in and rammed firmly and level, and above this a layer 3 inches thick of fine washed gravel two parts, and cement one part, mixed to the consistency of soft mortar, spread evenly over the brick rubble with a sharp fall to the front, where a row of 3-inch drain-pipes must be laid with a sufficient fall to the outlet -this will make a good and permanent bottom. The next consideration is the drainage: this may be from 9 inches to a foot in thickness, and may be formed of brick-rubble, or any clean, rough material at hand, placing the roughest at the bottom, and finishing off with the finer particles, to prevent the soil entering and elegging the drainage. Above this place a thin layer of fresh-cut turves evenly, grass-side downwards, before putting in the bulk of the soil, which must not be in a wet, sticky state when used. The best material for this is the top-spit, cut 3 inches thick, of an old pasture or deer-park, well mixed with the usual ingredients of lime-rubbish, crushed boues, &c.; but this is seldom to be obtained. nary good garden soil may be relied upon to produce tine crops of fruit if the following substances are added to it:—One bushel of crushed bones, a bushel of charcoal to each cartload of soil, with a barrowload of lime and mortar-rubbish, if the staple soil is of a heavy texture; or the same amount of pulverised clay, if it be light and sandy. If the soil is deficient in calcareous matter, a due proportion of finely-broken chalk may be incorporated with it, by turning two or three times before making up the When forming the border, trample or ram the soil firmly together as the work proceeds, and not making it more than 30 inches deep.

GUSTAV MANN.—The current volume of the Botonic il Magazine is dedicated by its editor to Mr. Gustav Mann, late Assistant-Conservator of Forests in Assam, who, previous to going to Assam, explored the Camaroons and Fernaudo Pe to the great profit of Science.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Weilington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent us early in the week as possible, and duly signed by the weiter. If desired, the signature will not be printed, but kept us a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

III. estrations. The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees dec.; but he cannot be responsible for loss or enjury.

Local News. Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is the southly to being under the notice of horticulturists.

N wspapers.—Correspondents sending newspapers should be correful to murk the paragraphs they wish the Editor to see.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—40.4°.

EVEN the uninitiated tourist of the City stamp must realise, after a few hours drive in Guernsey, that a large proportion of the land is devoted to Grape and Tomato culture under glass. Indeed, in some parishes, not less than half of the actual superficial area is under glass. In view of the fact that the Guernsey farmer is, as a rule, if not wealthy, at least comfortably off, a few remarks concerning his mode of procedure may not be altogether without a lesson to the British grower.

First, as to Tomatos. They form decidedly the staple crop of the local farming year. During the month of December, some Tomatos of the last crop, specially preserved for the purpose, are mashed into a pulp, and with the aid of a Tomato-sieve and a basin, the seed is extracted therefrom. This seed is put into the soil of the greenhouse a few inches deep, and the plant, manned with prepared bones, we, and trained perpendicularly, by means of

strings and cross-laths to a height of about 6 feet, reaches maturity just before the month of April. Less than a month later, the fruits are all picked and exported. Subjected to renewed treatment, the plants bear a second crop of Tomatos about the middle of August.

The growth of Grapes is also remarkable, and is becoming more and more popular every year. Almost every country-house in Guernsey has its conservatory, and a large proportion assist in supplying the British markets. Under certain conditions, these Grapes ripen perfectly without any artificial heat, at a semewhat earlier period than in England. In ordinary years, the cutting season commences early in August, and by the end of September most of the houses have been cleared. The infection of the Grape-growing industry has spread to Jersey, where some of the big conservatory owners can and do show fruit often larger than, and sometimes of quite as fine a tiste, as the much-lauded Guernsey Grapes.

That Guernsey is a land of Grapes of course, after Tomitos—is patent to the stranger even before he lands. As soon as the mail-boats get alongside the quay, they are boarded by numbers of young women with baskets of Grapes for sals. The prices paid on these occasions are, of course, much higher than those demanded in the greenhouse, and even in the shop. Nevertheless, the ubiquitous Guernsey Grape-marchande manages to get rid of the greater part of her stock.

A reliable market report on Guernsey produes for a week in the middle of September, when the best part of one constituent part of the prolue, namely, the Grape, is on the market, gives the following prices as actually paid by dealers in the North of England: Black Humburgh Grapes, 3d. to 4d. per pound; Alicantes, 5d. to 6d.; Tomatos at the same time were sold at 3d, to 31d, per pound for smooth, and $2\frac{1}{2}d$, to 3d. for ordinary Tomatos. With respect to the demand, the same market report stated: "Tomatos: although supplies from the Channel Islands are decreasing, the second crop of English is coming in, so the demand at present prices is fully met,"

It must be borne in mind that Guernsey, in common with all the Channel Islands, boasts a wonderfully fertile soil, and an exceptionally favourable climate for fruit-culture. There is also ample bright sunshine. A noted Royal physician declares he is surprised to find growing in the open air in Guernsey plants which are, in England at least, looked upon as tropical.

So, aided by Nature, incited by a laudable desire to make money by hard work, strict attention to the needs of his crops, a careful noting of the conditions under which these best thrive, by judicious manuring, and the maintenance of a mented reputation, the resident on Sarnia's soil is able to make his land secure him the necessaries, and sometimes the comforts of this life. But, as already hinted, if the Guernsey farmer be comfortably off, it is not the result of sitting with his hands behind him. Before he can enjoy any of the receipts of his crops, he has to pay a considerable sum of money for the building of his greenhouses. All the glass, wood, and other material, has to be imported, and, if it be a question of heating the house, there is a big item for engineering work, the installation of boilers, pipes, &c. There is no coal in the island, and practically all the fuel has

to be imported. To make the hot-house anything like a success, and to keep pace with the growing competition, it is necessary to have continual labour for taking care of the fires, regulating the temperature, opening and closing of the ventilators, &c. A large grower in the north-west of the island showed us one of his average-sized hot-houses, measuring 155 feet in length, and approximately 35 or 40 feet wide. This is quite a plain house, with only necessary adjuncts, but its building, fitting, heating and all, when complete, cost him over £350. It would seem that the boilers and pipes are responsible for quite half of the total cost, and if one inquires why growers do not confine their attention to the less expensive cold houses, one is told that the hot-houses form a speculation, where the initial outliy is more likely to be reconped by the ultimate multiplicity of the crops than in unheated buildings. Estimates for the construction of cold greenhouses range from $5\frac{1}{5}d$, to $8\frac{1}{2}d$, per fort "all over;" and some contractors will, in a fit of enterprise, offer to build you a house, providing you find the material, at as low a figure as $2\frac{3}{4}d$, a foot.

All shapes of greenhouses may be seen in Guernsey. Square, and lean-to (this latter has, as its back, the side of a house or a wall), round, and oblong houses are to be found in the various parishes. The commonest form is the oblong, some 10 or 12 feet in height at the centre, and running down at the sides to 2 or 3 feet, the sides being frequently superposed on a small brick or granite wall. Where lean-to cold houses are built, special efforts are made to afford the front of the building as much sunheat as possible. From the relatively large number of oblong, gable-shaped houses, it may be concluded that this form has been found, on the whole, the most suitable to the exigencies of Tomato and Grape culture in Guernsey.

The Guernsey greenhouses are, occasionally, brought into requisition for the propagation of Melons and other fruit, but these cultures call for no special remark here.

And now, with respect to profits. It may be authoritatively stated that, as a general rule, the Guernsey grower gets a proportionately better financial return for his crops than does the Jersey farmer for his. The very fact of the former's crops being raised under conditions which can generally bid defiance to climatic vagaries at once gives him an immense start in the race for wealth. But there is another factor which has no little effect on the Guernseyman's income, and that is, union among the growers

a factor, by the way, which seems to be erturely wunting among the agriculturists of the sister island. It is known that, at certain seasons of the year, Tomatos and Grapes from Guernsey are sought after with great avidity by Covent Garden and other market buyers, and this owing to the obvious fact that from year few other places can they be then obtained. Knowing this, and bearing in mind his initial outlay on building greenhouses, his care and attention in cultivating the fruits of the earth therein, and his object in bringing them to the passing steamer or the resident merchant—bearing these things in mind, we repeat, the Guernsey grower, conscious that his compatriots are with him, asks for his goods a price which, while representing the value of the fruit to the buyer, ensures him a return for his labour and the money laid out, and some pocketmoney into the burgain. And so it comes about that the Tomatos and Grapes change hands, and

every morning about ten o'clock, from April till October, and sometimes later, one can see thousands of baskets holding something under 20 lb. of fruit, being shipped on the out-going English steamers, the scene on the quay being hold curious and exciting. But, it must not be supposed that when the Tomatos and Grapes

Date Fruits at Nice.

In the Comptes Rendus for Nov. 9 we find an account, by M. AIMÉ GIRARD, of Phonix melanocarpa, which has been found to do well at Nice, and whose fruit is possessed of peculiar economic properties. "This Date Palm," says the writer, speaking of a specimen on the

which palatable and edible fruit has been gathered. M. CH. NAUDIN has named it Phoenix melanocarpa, to commemorate the black colour of the fruits."

As regards the constituents of the pulp, M. Ghand says: "It seems justifiable to affirm that the sugary matter which gives

Fig. 128,—sequota gigantea, at castlewellan, (see p. 720, (From a photograph by Lord Annesley.)

have all been despatched, the grower's work is done. His reigning idea is never to allow his greenhouse to be idle. So, after the Tomatos are out, he puts in Chrysanthemums either for ultimate sale, or for exhibition in November. In some hot-houses even Potatos are planted, and excellent prices are obtained for these, which are ready for exportation or home consumption at the latter end of January.

terrace of the villa Fleury de Cessole, at Nico, "came from Bordeghera, and was placed here in 1882 by M. Victor, be Cessole, owner of the villa: it was then ten years old, and from 1893 it has produced each year a dozen spikes, on which are formed fine, palatable, and sugary Dates, ripening in April in the Mediterraneau climate, whereas, under the African climate the earliest Lates are not ready before July. This Date-Palm is the first in France from

these fruits their flayour is formed exclusively of levulose."

As to other products included in the composition of the pulp, they have been determined by the ordinary processes of analysis. A remarkable fact has been ascertained. Among these products it has been impossible to detect either acids or tannin components. The absence of products of this class on the one hand, and the abundance of pectine on the other, accounts

taposition to these exhibits, were the displays of

for the particularly soft and mellow flavour of Dates gathered from Phonix melanocarpa. The constituents of the pulp of these fruits have been tabulated as follows:—

	Inedable Portion	
	3 to 100 of water 81 to 100 of water	 $\frac{7.65}{13\cdot10}$ $\frac{1}{2}$ $\frac{20.75}{13}$

Thus constituted the fruit of Phonix melanocarpa is possessed of particularly agreeable properties. In spite of its great richness in sugary matter, richness which in weight amounts to two-fifths of the pulp, the flavour, because this sugary matter is levulose, is soft and less marked than that of saccharose Dates; the absence of acids and tannins further accentuates this quality of mellowness; the tender pulp, of good substance, rich in pectine, melts, so to speak, in the mouth, and the refined quality of the Dates communicates a delicate perfume to it.

OUR ALMANACK.—Secretaries of Horticultural Societies and others, are earnestly requested to forward immediately, the dates of Show Fixtures and of Meetings of Botanical and Horticultural Societies of any kind for 1597, for insertion in the Almanack to be published in our issue for January 2.

ROYAL HORTICULTURAL SOCIETY.—Rev. W. WILKS, Secretary of the Society, writes:—"May I ask you to be so kind as to allow me the use of your columns to ask the members of the Fruit Committee to come to the next meeting, on December 15, prepared to revise the pamphlet Fruits for Cottagers, published in 1892. About 65,000 copies have been distributed, a new edition is now wanted, and the expediency of revision has been suggested."

LINNEAN SOCIETY.—At an evening meeting, to be held on Thursday, December 17, 1896, at 8 p.m., the papers to be read are: I. "On the Chalcidide of the Island of Grenada, E.W.I.," by Mr. L. A. HOWARD, Ph.D.; and H. "On the Development of the Ovulc of Christisonda, a Genus of the Orobanchere," by W. C. WORSDELL.

BOTANICAL MAGAZINE.—The December number contains illustrations of the following plants:—

Grammutophyllum Rumphianum, Miquel, t. 7507.—A very handsome species, known in gardens by the synonymous names of G. Gulielmi II., Kränzlin, and G. Seegerianum, Hort.

Prunus subhirtella, Miquel, t. 7508.—A Japanese species, with lanceolate, transversely plieate leaves, and corymbs of pale rose or white flowers.

Corbinia japonica, A. Gray, t. 7509.—The most interesting feature of this Coriaria is the colour of the flowering and fruiting petals, which varies from cherry-red to coral-red. It flowered in Canon Ellacombe's garden at Bitton.

Cypripedium ceul, Rolfe, t. 7510, described as insigne var. exul in these columns, 1891, ii., 94.

Iris allo-purpurva, Baker, t. 7511.—A Japanese species, with pale violet spotted flowers, allied to I. hexagona. Kew.

A SILVER BANKSIAN MEDAL FOR ALLOT-MENT CULTURE. — The Council of the Royal Horticultural Society has very kindly, through its Secretary, the Rev. W. WILKS, presented to the Technical Education Committee of the Surrey County Council, a Silver Banksian Medal for presentation to Mr. Harvey Hofkins of Carshalton, an ex-policeman, whose finely cropped and cultivated allotment

received the highest number of marks of all the allotments judged last summer by the County Council's horticultural instructors. The medal will, we understand, shortly be presented to the recipient at a public function, to be attended by Mr. E. J. HALSEY, J.P., Chairman of the County Council, Mr. Cosmo Bonson, M.P., and other gentlemen. This act on the part of the Royal Horticultural Society to some extent marks a new departure, and an excellent one, obviously capable of extension to other County Councils, which, like that of Surrey, give special encouragement to both allotment and cottage garden culture in their respective areas. It would add immense interest to such work, no doubt, were one of these medals annually awarded, and they might, perhaps, be given to allotments and cottage gardens alternately. Once well known, there could be no doubt but that competitions for the medals would be very great, and superior cultivation consequently promoted. The Royal Horticultural Society can make its influence for good widely known in the direction above indicate I. Journal of Horticulture, December 10, 1896.

LANDSCAPE GARDENERS AND ARCHITECTS.—We have great satisfaction in announcing that Mr. H. E. Milner has been elected an honorary associate of the Royal Institute of British Architects as one of those "who, by reason of their position, or of their eminence in art, science, or literature, or their experience in matters relating to architecture, may appear to the Council to be able to render assistance in promoting the objects of the Royal Institute." As, owing to some rather foolish publications the relation between landscape gardeners and architects has been somewhat strained, we are the more pleased to see the Royal Institute taking broader views. Mr. Milner is to read a paper on the "Relation of the Garden to the House," before the Institute in February next.

RATING.—On Friday, December 4, a special session was held at the County Court House, Wandsworth, to hear a number of appeals by the Surveyor of Taxes against assessments by the Wandsworth and Clapham Union, under the Agricultural Rates Act. Mr. Young represented the Assessment Committee, and Mr. WRIGHT, Surveyor of Taxes, represented the Board of Inland Revenue. Mr. George Clark, Priory Lane, Putney, gave evidence that he was owner and occupier of 7 acres of land in the above parish, 4 acres of which were under glass. Mr. WRIGHT contended these glasshouses were buildings, not only in the ordinary acceptation of the word, but were buildings under the Agricultural Rates Act. After an absence from the Bench for some time, the justices returned, and the Chairman announced that they had carefully considered the case, and wore unanimously of opinion that the case be dismissed. Twenty-three similar cases were dismissed on like grounds.

THE SMITHFIELD CATTLE SHOW .- An event of considerable importance, that invariably preceles the Christmas season, is the annual cattle show of the Smithfield Club, held this week in the Agricultural Hall, Islington. Some idea of the magnitude of these exhibitions can be formed from one fact alone. The value of the money prizes, cups, and other awards offered annually amounts to nearly £400). Primarily, of course, the display is one of "live meat," and this is perhaps an extremely uninviting spectacle for many of us who are more concerned with exhibitions of a very different nature. However, the "side shows" are so numerous and uncommonly varied, that some might be worthy of the visit of a vegetarian. During the short time we were present, after seeing the "best beast in the that obtained the Queen's Cup for the Lord of Glamis Castle, we preferred to wander through the extensive galleries, and inspect the wonderful amount of agricultural machinery, embracing all the latest improved appliances. These are of a character that leads one to think that latterly more advantage has been taken of modern mechanical skill in the matter of land - tilling than has ever before been the ease. Then, in jux-

roots, grains, and vegetables made by our leading seedsmen. Messrs. Surron & Sons, Reading, for instance, had piles of extra-sized roots of Mangels, Swedes, and Turnips. These, as well as the fine Potatos exhibited, were representative of the firm's best strains. From our point of view, the most interesting feature in Messrs, Sutton's exhibit were some Peas in pots. The plants were not more than 18 inches high, and the pods appeared to be about half filled. Messrs. Carter & Co., of High Holborn, also had a remarkable display of choice agricultural and horticultural produce, the latter including some excellent Potatos. Messrs. Dickson, Limited. Che-ter, mile no such effort, but confined their exhibit to some mounted specimens of the natural grasses, some Apples, and a few examples of young trees from the forest tree department of tho Chester Nurseries, Messrs. Web3 & Sons, Stourbridge, showed Swedes exceptionally well, and filled a larg- stand with a good assortment of general produce. Mr. J. K. King, of Coggeshall, Essex, and Reading, Berks, displayed general agricultural produce; as did also Messrs, Thos. Kennedy & Co., Dumfries, who had a number of young trees; and Mr. ALEX. BLATCHEORD, Coventry. In Messrs. JARMAN & Co.'s stand, of Chard, Somerset, was noticed good Parsnips, Onious, Turnips, some Apples also, and fruit trees. The well-known Potato raisers, Mr. Fidler, of Reading, and Mr. Findler, of Markinch, N.B., displayed some admirable specimens of some of the newest varieties of "The Tuber;" and Mr. HORNE, of Perry Hill, Cliffe, Rochester, Kent, showed some dessert and culinary varieties of Apples. Included in this exhibit were fruits of the variety of Fameuse, a consignment of which was recently presented to HER MAJESTY from Canada; it is of moderate size, very deep red in colour, and not particularly firm. Messrs. Harrison, of Leicester, had a stand that for effect was well deserving of mention, and it included an excellent lot of root and other produce. Berner's Hall and the Areads Gullery were filled with specialties in medicines and foods for eattle, and agricultural and horticultural manures. The corridor leading from the main entrance contained Meisrs. Spratt's stand, and other providers for poultry, game, and dogs. In another annexe was a sort of baztar, which contained novelties in innumerable articles, and the dead poultry was displayed in yet another hall; indeed, one's experience, when coming from the Smithfield Club Show, is to the offect that something of most things has been seen, besides much-very much-beef.

FLOWERS IN SEASON.—Among the few flowers obtainable out-of-cloors sometimes at this season may be mentioned the lovely blue-flowered Gentiana acaulis, a number of fine flowers of which have been sent us by Mr. J. ALLSOF, the gardener at Dalton Hall, Hull. They bespeak the mildness of the present season in that part of Yorkshire.

A LARGE BISMARCK APPLE.-A very fine specimen of Bismarck Apple was shown by Messrs. B. HURST & Son, Burbage, Hinckley, at the Royal Horticaltural Society's meeting on November 24, for which they received a Vote of Thanks; and they now send us a few interesting particulars regarding the fruits. "It was one of two growing on a dwar? espalier in a nursery row; the tree upon which it grew is four years old from the bull, and was worked on the English Paradise stock; it has three tiers of branches on each side of the middle stem; the tree is growing in the open in a very exposel place, but at the same time fully open to the sun; when last weighed and measured, the fruit was 15 inches in circumference and weighed 18 ozs. (avor.), and as you mention in your report, it was handsome and wellcoloured." [Bismarck was figured in the Gardeners' Chronicle, Feb. 18, 1893, p. 195.]

ESSEX TECHNICAL LABORATORIES.—The Journal for October contains a study of the bacteria found in the water of the Colne Estuary, so famous for its "native oysters," articles on the Essential softconstituents, on Butter-making, &c.

NATIONAL ROSE SOCIETY.—The balance-sheet to November 30, shows a balance in favour of the Society of over £76, as compared with one of £45 last year. Nearly £500 were distributed in prizes and other disbursements for the benefit of exhibitors. While the show at Ulverston cost only £2 12s. 8d. (not including the prize-money, which amounted to £13s) the receipts are placed at £80.

CORNWALL AS A WINTER RESORT.—The Great Western Railway Company has issued a third edition of its pamphlet on this subject. Readers of the Gardeners' Chroniele will not be surprised to learn that much of the evidence in support of the relatively equable climate of parts of the county is derived from the exotic plants which thrive in the gardens, records of which have been given in the Chroniele. We have, in fact, repeatedly given illustrations of the girdens of our westernmost county and of the adjacent Scilly Islands.

LEMONS IN CALIFORNIA.—According to an article in Garden and Forest, the greatest amount of success in Lemon culture is attained when the Lemons are grafted on Orange stocks.

THE GENUS SILENE. - An important monograph of this genus by Mr. F. N. WILLIAMS has lately been issued by the Linnean Society in the thirtysecond volume of the journal of the society. Mr. WILLIAMS carefully enumerates no fewer than 390 species, all authenticated and grouped with the skill of an expert monographer, reference being facilitated by tabular summaries, indexes, &c. "In the matter of absolute priority in the names of species," writes Mr. Williams, "I have preferred not to change a few old-established names which are always met with in the floras generally used, and under which the literature of the species is always to be found, in favour of obscure, little known (and usually inappropriate) names which may possibly have antedated them in publication by a few months. The plea of convenience and stability in nomenclature, is of far more scientific importance in morphology than endless name-changing for reasons of priority."

EDINBURGH SEED TRADE. — The seed trade assistants of Edinburgh held their annual dinner in Messrs. Airchison's Rooms, Queen Street, on the evening of Thursday, 3rd inst., under the presidency of Mr. Sclater. Over a hundred geutlemen sat down to an excellent menu. Fifteen seed houses in town were strongly represented, and the committee are to be congratulated on a highly successful gathering.

FAMOUS GARDENS ABROAD AND AT HOME was the subject of an interesting lecture delivered by Mr. F. W. Meyen on the 2nd inst. before the "Devon and Exeter Gardeners' Association." The meeting upon this occasion was held in the Guildhall. Exeter, where the representations of 100 lime-light views of foreign and English gardens were seen to advantage. The lantern was manipulated by Mr. J. I. Pengelly.

KEW GARDENERS' MUTUAL IMPROVEMENT SOCIETY.—On Monday last, 7th inst., a meeting of this Society was held in the garden library, Kew, Mr. W. Watson, Assistant-Curator, in the chair. Mr. Rolfe gave an interesting lecture, entitled "Orchids at Home and Abroad." During over an hour he secured the attention of the members. After a discussion by the student gardeners, Mr. W. Atson gave a r same of his thoughts on Mr. Rolfe's ideas. He paid special attention to the cultivators' view of the matter.

STOCK-TAKING: NOVEMBER. — It may have been at one time true that "when chemicals showed a decline," our imports, as a rule, fell off: to-day the fact is quite the other way, for, notwithstanding a decline in the inaports of chemicals, imports foot up the large total of £2,502,969 as the value for November, as against £39,006,911 for the same month last year, or an increase of £3,496,028. Had there been but four Sundays in the month (as in November, 1895) instead of five, as in the past month, the increase would have been still more

marked. The following figures are from the "summary" table of the Board of Trade Returns for the past month:—

IMPORTS.	1895.	1896.	Difference
Total value	g9,006,911	£ 12,502,969	+3,193,028
(A.) Articles of food and drink — duty free	12,658,182	14,085,506	+1,427,024
(B.) Articles of food and drink -dutiable	2,642,893	2,870,932	+228,000
Raw materials for textile manufactures	7,700,372	9,810,248	+2,109,876
Raw materials for sundry industries and manufactures	4,098,954	3,914,085	-184,869
(A.) Miscellancous articles	1,485,176	1,466,730	18,146
(B.) Parcel Post	83,461	110,863	+27,102

Interest naturally turns to the food supplies, and from Canada, the United States, Argentina, Russia, Roumania, supplies of Wheat, Barley, Oats, Indian Corn, have poured in. Our "Corn averages may be consulted for the effect of these on market prices. But food supplies and raw material for textile fabries account for the major part of the great increase for the mouth-cotton from the United States being placed at nearly 1,000,000 cwt. more than was landed in the same month last year. There was a heavy falling off in Australian wool, but this was compensated for in other directions; and West Indian sugar planters may find some consolation in the condition of the Beet-sugar supplies from the Continent-not very satisfactory for the producers, or for consumers here. Imports of Apples from Canada show an extraordinary increase, as witness the following table :-

orts.		1895	1896,	Difference

Always interesting, our usual fruit, root, and vegetable summaries have an added interest at Christmas time; and it is satisfactory to add that the supplies of Currants are in excess of those sent in November, 1895. London children are now revelling in good Apples at 1d. per lb.; Pomegranates at two a 1/.; Oranges being plentiful at three and four a 1d.;—this, not from the street-hawkers, but from the shop and market. We conclude this section by noting that the imports for the eleven months of the year are given at £398,303,740—against £379,750,023 for the same period of 1895—a gain of £18,553,717. As to our

EXPORTS

The value for last month - £18,539,853 -- against £19,540,333 for the same period last year, or a falling away to the amount of £1,000,480. The value for the eleven months is £219.631,003, as against £206,989,636 for the same period last year-a gain of £12.641,367. The reduction in American demands is accountable for a great portion of the falling off in last month's exports, textiles figuring most notably. also linen goods of various kinds. There is no doubt that politics have had much to do with this, but as no tariff'alterations are even hinted at in President CLEVELAND's last "Message," doubtless a firmer tone will be given to the market, with a corresponding result on this side. By the way, the export trade scare is just now exercising our French friends, to whom writers in various journals are now proving that Germany is making inroads on their foreign trade preserves!

NATIONAL CHRYSANTHEMUM SOCIETY .- A meeting of the Floral Committee took place on December 9, and, as might have been expected, only a few subjects came before that body. A Firstclass Certificate of Merit was awarded to incurved King of Orange, a new and distinct clear golden variety of compact character, shown by F. W. FLIGHT, Esq., Cornstiles, Twyford, Hants. This welcome addition to the incurved section was shown by Mr. FLIGHT in his first-prize stand of twelve incurved on Dec. 1, and was much admired. This was the only Certificate awarded. From Mr. CHANDLER, Nyn Park, Northaw, came Florence Chandler, a white sport from Primrose League, the basal petals suffused with delicate pinkish lilae. Mr. OLLERHEAD, the Gardens, send incurved Egyptian, shown in good character, but paler in tint than is usually seen; as this is one of the varieties that has raised the question as to its proper classification, it was thought best not to make any award until its proper classification had been settled by the special committee to be appointed for the purpose. Messrs. H. CANNELL & Sons, nurserymen, sent what they regard as a type forming a new section, namely, Midget, a miniature Japanese, like a diminutive Alfred Salter, pale pink in colour, the small incurved flowers compact and full. As a plant was shown as well as cut blooms, it promises to make a very useful decorative variety, and for cutting purposes. Mr. W. Wells, Earlswood Nurseries, had three single varieties, one of which, Disraeli, was Commended, a somewhat distinct and attractive variety of a creamy-yellow colour. Mr. Phillip Ladds, of Swanley, sent blooms of a large and brilliant yellow incurved Japanese, invaluable for late blooming, and said to be an excellent market variety, as it is largely grown for this purpose by Mr. LADDS.

CYCLAMENS MADE IN GERMANY. — Messrs. Hegh Low & Co. inform us that at the next meeting of the Royal Horticultural Society on Tuesday next, they intend to show a batch of Cyclamen, ha'f of which have been raised from the best German seed from several growers, and half from seed of their own saving. The plants are of the same age, and have been cultivated under i leutical conditions.

ADENOSTYLIS ALBIFRONS. — This plant, a native of Swiss woods, is used with good effect in the gardens of some of the Swiss hotels, and is also treated as a pot plant. In this latter condition, and in the absence of perfect flowers, it presents a remarkable superficial resemblance to a garden Cineraria. M. Correvon, in his useful little Flore Colorive de Poche (Paris, KLIENSECK), describes it as a robust plant, with very large rounded leaves on long stalks, une pully erenelated, dentate, grey, and cottony on the under-surface; stems 70 to 120 cent. (say, 2½ to 4 feet; glowers purplish, small; corollas tubular, in a wide-spreading head.

THE LINCOLN STAMP ALBUM. -The Lincoln Stamp Album must be now so well and favourably known to philatelists, that only to novices can it need recommendation. The appearance of a new (the eleventh) edition gives us an opportunity of commenting upon the usefulness of this album, which includes a series of maps and a descriptive postage stamp catalogue to aid the collector to identify his specimens. There are various qualities and shapes of these Lincoln albums, some of which are arranged to contain post-cards, post-marks, crests, and similar articles. The volume before us is handsomely got up; the paper is good, the divisions for the stamps of sufficient size, and, where necessary, of triangular, oblong, and other unusual shapes to accommodate special issues. It should be added that the address of the publisher, Mr. William S. Lincois, is now 2, Holles Street, Oxford Street, W.

ISLE OF WIGHT HORTICULTURAL IMPROVEMENT ASSOCIATION.—The usual monthly meeting was held at Warburton's Hotel, Newport, on Saturday, Dec. 5, when the Rev. H. Ewbank, M.A., Ryde, read an excellent paper on "A Garden in the Isle of Wight." The chair was occupied by Dr. Groves,

E.A., J.P., and there was a numerous attendance of members, who were evidently much interested by Mr. EWBANK's discourse on the cultivation of herbaceous and alpine plants in the island. He spoke of the many advantages it possessed for the growth of rare plants, and stated how, in his own garden, plants from many varied climes seemed to sacrifice their little peculiarities to a great extent and live together in harmony. Still, he had many losses to deplere amongst plants from foreign parts. In the course of his remarks he said that he considered many of the double flowers, particularly some of the large double-flowered Dablias of renown, vulgar-looking when compared with the many hardy herbaceous plants, such as Aconites, Cyclamens, Irises, Snewdrops, Hellebores, and Narcissi-which all received due attention from the lecturer. In the discussion which followed, it was pointed out by the gardeners coming from various parts of the Island, that many plants considered half-hardy will stand without protection in the severest of winters, and that much might be done by District Councils in the Island to enhance its beauty, and make it still more attractive to visitors than it is, not making in name only, but in reality, the Garden Isle.

THE DARWIN STATUE. —It has been resolved by the committee of the Shropshire Herticultural Society to place the commission for a statue of CHARLES DARWIN in the hands of Mr. HORACE MONTFORD. It is proposed to erect it is front of the Shrewsbury Public Free Library, formerly the Free School building, where DARWIN received a portion of his education.

PLANT PORTRAITS.

HOME CORRESPONDENCE.

LAPAGERIA SEEDLINGS. I may inform Mr. Burbidge that last season the white and red varieties fruited here very freely, and that I have raised a few plants from the seed sown, of which I send one for your inspection. Also flowers of L. rosea var. not think seeding is beneficial to the plants, as they do not seem to grow so freely afterwards. The plants here are growing in a small conservatory, and kept quite cool. The flowers are fertilised by insect agency here for a certainty. Thus. Denny, Down House, Blandford. [The fruiting of any plant is a deterrent to growth. The young seedling is interesting, and the flowers are very fine. En]

ORIGIN OF THE SOUVENIR DE LA MALMAISON CARNATION. In the obituary notice of Mr. William Young, in your issue of November 28, it is said that, among other things, he introduced the original Mal-maison Carnation. The impression given is that it was raised by him. I have often tried to find out its and have read several suggested ones, none of which seemed quite clear or satisfactory. have always had an impression that it might have taken its name from the good old Bourbon Rose. Souvenir de la Malmaison, which to me, the oldest form of the Carnation much resembles in colour and The Rose was probably introduced prior to the advent of the Carnation. In 1843, I believe, the Rose came to England, and so fine and distinct a Rose must have become a favourite, and it may have suggested the name for the Carnation. George Stanton.

GROS COLMAN AND GROS MAROC GRAPES .-Mr. Kirk's remarks on p. 665 will have startled many Grape-growing exhibitors not a little. In support of the northern gardeners' practice of placing Gros Maroc before Gros Colman when staged in the "any other black Grape" class, Mr. Kirk says:—"We find Gros Maroc, in the month of September, is much superior to Gros Colman," adding, "and as a proof of this, I may mention that it (Gros Marce) was put 1st in the "any other black Grape" class at the 1st 16 the 'any other black Grape' class at the Edinburgh showheld last September, beating Muscat Hamburgh and Madresfield Court!" Mr. Kirk concludes his note by asking, "What do correspondents of the Gardeners' Chronicle say to that?" What, indeed! It is certainly hard to express a decided opinion without having seen the respective exhibits. But to account for the decision of the judges, I should conclude that the examples of Muscat Hamburgh and Madresheld Court were of moderate quality, and the Gros Maroc exceptionally fine. It is hard to believe that practical Grapegrewers who are acquainted with the characteristics of the Grapes in question would have made such an award had the specimens of Muscat Hamburgh and Madresfield Court been good, for these varieties are superior in flavour and quality to Gres Maroe when at its best. With regard to the relative qualities of the Gres Colman and Gres Maroe Grapes, I may say that I have grown the latter from the time it was first exhibited, and I have on several occasions include I what were described in the horticultural press as good examples of Gros Maroc in the twenty-bunch class, in ten varieties, as well as in large collections of fruit, at the Crystal Palace, both from Vines inarched on the Black Hamburgh stock and from others on their ewn roots, and the flavour of the fruit from the Black Hamburgh union has been superior to that possessed by fruit obtained from Gros Maroc on its own roots. In equally good examples of Gros Maroc and Gros Colman, the flavour is better in the former than in the latter in the month of September. But I do not for a moment suggest that Gros Maroc, Gros Colman, Black Alicante, Lady Downes, Alnwick Seedling, Gros Guillaume, or any other thick-skinned, long-keeping, black Grape, is to be compared in quality in September with either Museat Hamburgh or Madresfield Court. Moreover, the last-mentioned two varieties are fit to eat in August and September, and the above-mentioned varieties certainly are Hence the too common practice of staging these Grapes in the "any other black" class in Angust and September, should be discountenanced; leaving the thick-skinned Grapes to be shown at the Chrys authemum and fruit exhibitions in November. One great drawback in the constitution of Gros Maroe is that with age its productiveness greatly decreases, a circumstance which will prevent its ever becoming popular with market-growers. This is also the opinion of Mr. Moxham, the manager of the Ashford Vineries, Fordingbridge, who is a most extensive and skilful cultivator of Grapes for market; his staple varieties for supplying the summer and carly autumn demand for Grapes being Black Hamburgh and Cannon Hall Museat. The latter variety freely with Mr. Moxham as the former, whilst Gros Colman is grown in several long houses, and Black Alicante in less quantities for winter and spring use. All the Vines when seen by the writer, towards the end of July last, were bearing heavy crops of handsome well-proportioned bunches. H. W. Ward, Lime House, Rayleigh, Essex.

-It would be difficult to support the action of any judge in placing Gros Maroc before Muscat Hamburgh and Madresfield Court Grapes. I had not time to examine the Grapes at the exhibition referred to, but I have a distinct recollection of the remarks made upon them by our felicitous friend, Mr. Kirk; and more than ence, too, in his vincries at Norwood, which were not eulogistic of Gros Marocs, yet I think the Marocs in these vincries were as fine in appearance as they are seen anywhere. It is an old Scotch adage—"Ae man's meat is another man's and I feel sure that Mr. Kirk would never poisen, choose for his own palate Gros Maroc if he could get either of the others. Exhibitors who have competed frequently, and have had their share of disappointments, are generally alive to the grades of excellence in exhibits. One such man judged the Grapes to which Mr. Kirk refers, who was like his colleague, a keen, painstaking-man. It is a pity Black Hamburghs and Muscat Hamburghs should be seen so seldom on exhibition-tables; and it is not often they are now seen fit for exhibition at all! It is agreed on all hands (in the north, at all events) that there has been retrogression in regard to the culture of the finer sorts of Grapes. Where do we ever see such Black Hamburghs and White Muscats as were tabled by Mr. Drummond at the first International Show held in Britain in October, 1862, at South Kensington, and the finest fruit-show we have ever seen! Some years later, the first International Show held at Edinburgh (nominal in character, however, astounded visitors when they witnessed the grand Black Hamburgh Grapes of Mr. Meredith, and Muscats from Mr. D Thomson, at Archerfield. At the second International Show in

Edinburgh, the late Mr. Johnstone surprised everyone by taking eleven 1st prizes and two 2nds in the leading classes, Black Hamburghs, Muscat Hamburghs, White Muscats, and Lady Downes being his best Grapes. There is a great want of competition at herticultural exhibitions in the north—Edinburgh, Glasgow, and Dundee especially; the shows of fruit are due to the numerous classes. Fancy our friend Kirk having next to no opposition at Edinburgh in the class for a collection of fruit, when the larger prizes were so tempting! M. Temple, Carron, N.B.

LARGE BUNCH OF GROS COLMAN GRAPES. -At a trade show in Birmingham last week I exhibited a single bunch of Gros Colman Grapes weighing 6 lb. 7 oz. Mr. Crump, of Madresfield, was judge, and said it was the largest of the variety he had any knowledge of. Can you oblige me and say what are the records of heaviest Gros Colman as grown up to the present! Some of the berries in bunch in question were nearly $4\frac{1}{2}$ inches in circumference, the average being over 4 inches. I notice Mr. Barron puts the weight up to 4 lb., with $4\frac{1}{4}$ inches circumference, but I have many times exceeded these. am much interested in the figures, and shall be obliged by any information you can give me through the Gardeners' Chronicle. Robt. Grindrod. [The largest herry of which we have record was 4 inches in cir cumference. We have no record of any large bunch o Gros Colman, but doubtless many of our corref spoudents can oblige you. Ep.]

SWEET PEA CUPID.—That novelty in Sweet Pea Cupid did well with me this summer. The seed was sown in the month of February in a gentle heat, and the seedlings were potted off in the following month into small 32's, and then placed in a Peach-house, where they remained until the middle of April, when they were stood in a cold frame till May. By this time they had grown over the sides of the pots, and some of the plants had each nine flowers. They were planted altogether in a small bed, and eventually formed a mass of white flowers, the thirteen plants giving about 500 sound seeds. The bed was manured with rutted hot bed materials and leaf-mould. The soil is naturally a light one. Wm, Jolland, Tivo'i,

THE CHRYSANTHEMUM IN DECEMBER.—In the development of the Chrysanthemum as an exhibition subject, it is now made evident that in a favourable season the Japanese varieties that are among the carliest to flower can new be had in fine character in the beginning of October, and later blooming ones as late as the end of December. Taking the exhibitions of the National Chrysantheman Society during the pust two seasons as fair criteria from which to conclusions, it will be remembered that in 1895 the October exhibition of the Society brought together blooms of such remarkable qualities, as to rival in refinement and high character those usually seen in November. The summer of 1895 was generally uniform in character; and the December show of that year drew to the Aquarium such an unusually large number of exhibitors and blooms, the latter of such fine quality, as to occasion great surprise. In the present year the October display was quite weak, owing to the incidence of a season that old growers say was one of the most unkind that they had experienced for years; but in December they were able to exhibit Japanese and incurved blooms so numerously and so refined as to be extraordinary. So far from this being an accident of incidence of the season, or of cultivathere is reason to believe that a December exhibition, if held in the first week, or at latest in the second, will continue to be the floral surprise it was a few days ago. Growers have dared much and acquired experience during the past few years; and were they favonred with a dry, comparatively mill, and fogless winter, there seems no reason why a creditable exhibition should not be got together carly in January. Even now, the Chrysanthemum takes a high place among our Christmas flowers, but it is the great demand for cut flowers at that season which creates so much novers at that season which creates so much uncertainty in reference to a January exhibition. A fow years since, the National Chrysanthemum Society attempted a mid-winter show in January, but it proved disappointing; it was abandoned, and the December exhibition established in its place. The committee of the National Chrysanthemum Society is constantly being exhorted to find what is mentioned as a more suitable place in which to hold their exhibitions. The committee have from time to time inspected halls which have been recommended as well adapted for the purpose, only to find them

too small, inconvenient, and expensive; and similar steps taken by a section of the committee have probably met with similar results. One thing appears to be quite certain, that if the society ceases to occupy the Aquarium, it will have to relinquish two, if not three, of its four annual exhibitions, for it would then have to provide staging, print and post bills, and advertise in the daily papers, &c., all of which is now done at the expense of the Royal Aquarium. Is it a matter for wonder that the committee hesitate to make a change at the call of those who are of necessity ignorant of these and other circumstances of like importance? R. Dean.

HARDINESS OF CEDRUS DEODARA.—I can corroborate what Mr. Simpson says, p. 696, as to the hardiness and good growth of the above variety of Cedar at Wortley. I remember the ones now fine specimens as very small trees, when I began my gardening career at Wortley in 1856. During the six years I was there others were plauted. After an absence of several years I went through the gardens at Wortley about a month ago. I noted the specimens of Cedrus Deodara in particular; the largest one would be fully 40 feet in height; and the stem if cut down would have from 24 to 30 cubic feet of timber in it. The grounds at Wortley are very bleak and exposed to the east. If 20 acres of a suitable part of the park had been planted with C. Deodara at the time the present specimens were planted it would have been a fair investment. H. J. C. Grimston, Tadeaster.

— The Deodar as a timber tree is a failure in East Kent, as I and my neighbours have experienced. Larch, Spruce, and Austrian Pine fleurish, and I am now making a plantation of them, but have to emit dear Deodar. Walter V. Lister.

— Mr. Simpson is surely poking fun at your readers in praising the Deodar as a forest tree. It may be the most precious tree in the world, but surely we have no evidence that it is so. Even by his own note he shows that it wants certain favourable conditions; whereas how can we plant forests, or even woodlands of any extent, if we have to think whether a tree wants a dry bottom or not! [Woodlands are sometimes drained. Ed.] This tree, as usually grown in pleasure-grounds, with the great care that gardeners generally give to it, is very often a sickly-looking tree, never showing the vigour of the hardier Cedar of Lebanon—I mean, in our country. A Planter.

HOW I GREW A GOOD CROP OF ONIONS ON POOR SOIL.-When I came into this neighbourhood to reside a few years ago, I was curious enough to ask first one and then another of my neighbours what they found the ground best suited for; they kindly told me, but said that I should not beable to grow Onions nor Strawberries, and several other plants, such as Brussels Sprouts. Before going any further, I must inform my readers how I make a valuable manure for the Onions. I am situated where fowls do well, having a few acres of pasture-land on which their run is almost unlimited, my stock numbering about 100; these are divided, and roost in four different houses. Every morning the droppings are collected and put on the ground intended for the Onions, and this number gives manure sufficient for 6 square yards; after cleaning the fowl-houses, they are well sprinkled with fresh-slaked lime. Now suppose we call the birds machines, by which we manufacture the-if you like-British guano; and when it is understood that I feed with Wheat, Barley, Dari, Oat-meal, bone-meal, calcined oyster-shell and flint-grit, besides a little meat-biscuits, all sound and of good quality, it should be a good guarantee that the manure is valuable one. Now for the erop of Unions off this poor soil, as stated above. I top-dressed 6 square yards every morning, until I had finished the allotted ground necessary for the purpose, sowing so that they require little or no thinning-the result was about 10 lb. to the square yard, which is, at ½d, per lb., about £100 per acre. Should you care for it, I shall have a valuable experiment for publication at the end of the next Strawberry season. Joseph Meredith, Rosemound, Bishops Offey, Eveleshall, Staffs. [The experience of so able a cultivator is always welcome, Ed.].

PEAR, HUYSHE'S VICTORIA.—This just now forms our dessert Pear, and a very excellent one it is, following close upon the heels of Marie Louise. Although I am now writing in praise of this Pear, this is the first time I have been enabled to do so, for this reason, that in previous years we always made the fatal mistake of gathering far too early. This year, however, I took the necessary precaution that this

should not occur again; so that notwithstanding sundry attacks from wasps, tomtits, and gales of wind, the Pears were allowed to haug on the tree until long after the usual time of gathering, with the result that now we have a very superior Pear, buttery, melting, juicy, and likely to keep in use until well into January. Marie Louise, although a very fine Pear, is at the same time a very disappointing one, for directly it gets about ripe it has a trick of going sleepy, or black at the heart. Of this "heart disease" Hnyslie's Victoria seems to be free, hence its being more long-lived. My H. Victoria is now a fully developed pyramid. When I say developed, I mean that for many years whilst we had plenty of money, and, of course, plenty of men, these trees were neatly pruned in closely, as was the fashion, so that a string when fastened to the lowest horizontal branch, and then stretched to the top of the tree, would define what was supposed to be, horticul-turally speaking, the proper contour of the tree. Men and money grew scarce; the trees were very much left to form their own deportment-with the result that on these formerly highly-trimmed trees we have now loads of excellent fruit. Not that it reflects any credit upon our management; but I should very much have liked to have sent you a photograph of some of our trees so fruit-laden, and afterwards of their appearance when some of them were completely broken down under the load of fruit. Had I been an employe of the Royal Horticultural Society at Chiswick, and this had happened, no doubt they would soon have got together a kind of self-constituted committee of inspection to seriously consider whether I had arrived at that state of dotage when it would be advisable to offer me a comfortable retiring pension. Private gardeners are often retired without very much pension. Amongst the many blunders belonging to the Royal Horticultural Society they certainly have this redeeming point, which is a credit to them, namely, that they retire their old servants liberally. Long may such a liberal spirit continue! Huyshe's Victoria in appearance very much resembles that of an Easter Beurré, but it is a better and far more useful fruit. Would anyone kindly say whether they have given it a trial on a wall 'H'. Miller, Combe Abbey.

CHRYSANTHEMUMS BEAUTY OF TEIGNMOUTH AND PRIDE OF MADFORD.—When I wrote to the dardeners' Chronicle before, I distinctly said when Pride of Madford and James Lynch were sent to Mr. Salter, they were both named. I did not say they were both named James Lynch, as was stated in the Gardeners' Chronicle, I also said Pride of Madford was dead or rather it failed to give any cuttings; on arrival. What I intended was to prove that Pride of Madford was named and distributed at least two years previously to Messrs, Hannaford receiving it. I cust no reflection upon Messrs Hannaford, for as I said, the names must have got mixed or lost in the transit. I also wished to point out the mistake Mr. Godfrey had made in labelling James Lynch (and a very poor specimen of it) as the true and worthless Pride of Madford: it struck me as being a slur on our friends over the water, after they had sent us such beautiful varieties as Pride of Madford, Oceana, C. B. Haywood, Australia, and James Lynch. What appeared in my catalogue had not been proved until the two varieties had flowered this year, and they were seen to be synonymous; it was then that I introduced it at the National Chrysanthemum Society, on Oct. 21, and was awarded First-class Certificate as Pride of Madford, its true and proper name. W. Wells, Earlswood.

CYCLAMENS NOT OPENING THEIR FLOWERS.—I have carefully read the correspondence in the transleteners' Chronicle on this interesting subject, but without particulars as to "C. B. W.'s" mode of enlitivation, it has been practically impossible to state a reason for his flower-bnds failing to open. In this week's issue he favours your readers with the necessary information, and this coupled with the valuable remarks of the Editor as to the water-logged condition in which he found the two plants sent, seems at once to point out where he has erred in their cultivation. The pots should be one-third filled with potsherds, then a little sphagnum or other moss or leaves, after which fill the pots with soil composed as follows, equal parts of good yellow loam, leaf-mould, and coarse sand, adding a handful or two of some good chemical manure, or if preferred, some decomposed cow-manure, say a fourth to a barrow-load, then pot lightly, preserving every root possible. "C. B. W." seems to have omitted to use coarse sand, which is absolutely necessary to suc-

cessful cultivation, and uses instead peat which is not at all desirable but detrimental. Good drainage is one of the most essential elements in their cultivation. which would be a difficult thing to accomplish when using the soils "C. B. W." has used. The plants must always be kept in a moist condition, syringing them overhead three or four times daily if success is aimed at; but they must be so potted that the water immediately passes through the pot. the plant to get water-logged is almost as detrimental to their health as to suffer them to get too dry. Many growers are successful in growing plants until the buds begin to show, but cannot understand why, having succeeded so far, the flower-buds fail to open: and many then use liquid manure, with a view to assist them to expand (as recommended by one of your correspondents), when, as a matter of fact, the mischief is done long before the plants get to this stage, and all the manure in the world will not undo the mischief that has been done. When the flowerbuds are showing, the plants should be carefully watered, so that the water does not settle in the centre of the corm or bulb, and any dead leaves or flower-stalks should be pulled out, not cut off, as is so often done. In conclusion, I regret I caonot offer "C. B. W." much encouragement with the plants he has; probably some of the flowers will open, while others will remain in a semi-dormant state; but I should be very much surprised to hear that either the removing them from their elevated position, or feeding them with liquid manure, as previously recommended, had the desired effect. F. C. Edwards, Author of " Cyclamens, and How to Grow Them."

AMPELOPSIS VEITCHIL UNDER GLASS.—A day among the "Muus" in and around Edinburgh brought me other pleasures in addition to that on placing me abreast of some of the finest varieties and the highest culture of these plants that have almost robbed the Rose itself of its supremacy. One of the simplest and least expected of these was found of the end wall of a Chrysanthemum-house, covered with this beautiful creeper, in finer form and richer in colouring than I have ever met with it before, and that is saying a good deal, for 1 have seen the best that fronts and backs of colleges at Cambridge can do to adorn themselves through growing A. Veitchii to perfection and display it artistically, either in large masses alone, or contrasted with the best silver and golden variegated Irises. But here, under glass, the crimsons glowed with even greater brilhancy, and the leaves were larger and po-sessed more substance. Possibly the colours were enriched owing to their being seen in contrast with many of the yellow and white flowers of the Chrysanthemums, such as Graphic, Duchess of York, &c. But I afterwards met with the Ampelopsis, apart from the brightness of Japanese and other Chrysanthemums, and found its size and brilliancy, and nscfuluess for table and other decorative purposes greatly enhanced by the shelter afforded by glass. In all gardens, north or south, in which this lovely creeper has failed to grow or colour well, I would advise that it should have part or whole of a light cool glasshouse to itself. D. T. F. [It is apt to get so coarse under such circumstances as to be unrecognisable. Ed.]

HAMBURGH, OR PLAIN-LEAVED PARSLEY .-- For the hundred and one uses to which l'arsley is put in the kitchen, the plain-leaved, more robust growing variety is just as useful as the "finest moss-curled." and much more readily freed from dirt. The roots are grown in most gardens for culinary uses, so that not many, if any, more need be grown if the plant is compelled to produce nice young leaves all through the winter. The intelligent gardener will scarcely need to be told how he may obtain these, although the amateur may be glad of a hint. If he have a greenhouse or intermediate-house, or even a warm cellar that is provided with a fair amount of light, he may pack the roots in soil in a conical heap with the heads all pointing outwards. This heap may be made in a flat hamper, such as the nurseryman uses to pack potted plants in when sent a distance by rail or carrier. The mass is then transportable; or it may be made on the floor, and it may take the shape or carrier. or a lean-to heap against a wall. After packing two or three layers in mould, afford a moderate amount of water and proceed as before, affording more water and so on till it is finished. Supposing that all the autumn leaf-growth was twisted off the roots on lifting them, the growth made under glass or elsewhere will be new and tender, and just as much appreciated by the cook as that from out-of-doors plants, often so difficult to collect, and unpleasant to gather in frosty weather or from beneath the snow, as many a gardener who has been in the kitchen

garden well knows. Where pits exist which are provided with hot-water pipes, the roots may be beddedout on the flat, and treated to a temperature of 45° to 55°, air being afforded daily, if only for a few hours, to keep the leaves from "fogging" off. A. Y. E

IMPROVED SOWING OF FERN-SPORES .- There are many methods of preparing the soil when raising Ferus from spores : and one that should not be neglected is to destroy all trace of plant-life, such as moss and Liverworts, by soaking the soil in boiling water before making use of it for filling the pots and pans. Another way is to char the soil. Some persons use loam, leaf-mould, or peat, in the spore-pots, whilst others scatter the spores on soft bricks or blocks of hard peat, or ou wood, coke, &c. Charring the soil in a certain manner. This method, though not differing very materially from some of the older ones, possesses advantages worthy of consideration. Clayey-loam is the soil recommended, and it is one that is generally obtainable. If possible, it should be of the consistency of putty. Break it into small pieces with the fingers, place it on a shovel, and submit it to the heat of a strong fire. Shovel and soil becoming of a red-heat, should (if properly burned) assume a blackish colour in cooling, and the soil should then be passed through two sieves, a '-inch meshed one placed on the top of a \frac{1}{4} inch mesh sieve answers the purpose very well. maining in the linch sieve is very suitable for use in the sowing of spores, and it may be said here, that dust is totally improper for successful work. The holes of the pots or pans should be stopped with a large crock, and three-parts filled with pure loam, the remaining part consisting of the charred soil. The properties of the soil when charred are peculiar, being very porous, although close-grained, and when well damped, it keeps moist for a long period of time (a piece of this soil put into the mouth has an effect similar to that of a French fondante-flavour excepted '). At a place where the above method is practised, hundreds of pots are placed on a stage in a small house set apart for the raising of Ferns by spores; each pot is provided with a saucer, which faciltates watering; and no glass is used to cover them; but if the pots and pans have to be placed with other plants, it is advisable to cover each with a piece of glass slightly inclined, so as to protect the spores from water whilst syringing the other plants. With this treatment no moss appears, or if any, not in sufficient quantity to injure the young prothallus. The employment of such soil on the surface of the spore-pots, &c., considerably facilitates the tedious operation of pricking-off the young Ferns. Of course, it must be understood that after the sowing of the spores, the pots should be placed on a shelf or stage near the glass, the stage being covered with coal-aslies or other moisture-holding material. Lowis Gentil, Kew.

HORTICULTURAL INSTITUTE.—It is most gratifying to observe the wide-spread interest in the proposed Home of Horticulture, as evidenced both in the public prints and in private correspondence. In a few days I will send my drawings and suggestions to you, and shall be obliged if you will afford space for their publication in your columns, in reply to the questions which are now being asked. James L. Wood. [The scheme will be published probably in our next issue. Et.]

SCOTLAND.

GLASGOW BOTANIC GARDENS.

Since these gardens have been acquired by the Corporation, a considerable amount of change has become apparent, more money having been spent in plants, both outdoor and indoor, and the sum spent in maintenance is not so limited as formerly, when the late Mr. Robert Bullen was the Curator. This is a happier state of things, and the free opening of the gardens on Sundays and Saturdays brings a crowd of visitors from the town and country. Pity that all our municipalities do not wake up respecting their hotanic gardens, and place their cost of keeping-up upon the rates.

There was a brilliant show of Chrysauthenums, under the management of the present Curator, Mr. David Dewar, particularly in the annexes and round about the Kibble Conservatory; and what with the great plants of Camellia alba, many of them in flower,

and the superb collection of Rhododendrous (which are allowed space for full development), and the immense quantity of blossoms upon them, the Tree-Ferns, and the Palms, the promenading area forms a winter garden which has few equals. In time we may look for an interesting assortment of Orchids and miscellaneous plants, both under glass and outdoors. The collection of Ferus. succulents, and medicinal plants has always been well maintained; and with a more liberal means at command every other department will in time be made more striking and instructive. Among the plants in flower that is not often seen was one of "Echmea spectabilis 1t is one of the strongest-growing species, and has long, lanceolate, acuminate leaves, much louger and broader than those of Echmea fulgers, of a brownish-green hne, coarsely serrated at the edges; the panicle of tlowers stiff, and growing to a height of about 20 inches, very much forked. The flowers are of a dullish-pink hue, each about 1 inch long, and tapering, with a contracted orifice, making an altogether stylish-looking plant, suitable for any garden. J. A.

Notes on Some Scotch Gardens.

On visiting country-gardens and gardener, it is gratifying to observe those gardens which were a few years ago in a state of deplorable neglect, made clean and tidy, with every plant and shrub, and tree, in flourishing condition. There are a goodly number of gardens in Stirlingshire which have passed into the hands of new proprietors, and in many cases special efforts have been made by the new owners to render the policies and gardens worthy adjuncts to the perhaps fine mansion or extensive estate.

LARMERT House, the residence of Mr. Graham, a beautiful place, but once sadly neglected, is now fit to rank with the leading residential estates of the district—roads, walks, shrubberies, and lawns, are put into good order in conformity with the tastes of the proprietor. On the occasion of a visit made in early autumn, it was noted that the old state of affairs was quite changed—new ranges of glass have been creeted in modern style, and these were filled with choice, well-grown plants. Fruits of various kinds grown under glass, were attractive and abundant.

Among stove-plants in robust health were some remarkably well-coloured Crotons, among which I remarked one named Lord Salisbury, raised by Mr. Airdrie, the head gardener at Larbert, in its leaf-markings very beautiful and distinct; the lower leaves green with yellow spots, whilst those higher up the plant, are of a pale pink colour, and the centre leaves are yellow. Others raised from seed give much promise, viz., C. Countess, C. Flamingo, C. Magnificent, and C. Prince of Orange, are of very fine vivid tints. Begonias, of the tuberous-rooted -cetion, have received considerable attention in recent years, and Mr. Airdric has raised many fine varieties, of which B. Mrs. Graham is a fine flower which measures 5 inches across, scarlet in colour, and an extra fine variety. Some double and semi-double flowered varieties are also excellent. In the stove devoted to fine foliage-plants generally, which are in fine condition, some well-grown Dendrobium Wardianum growing in suspended baskets were noted.

Grape vines were very promising, and these included the following varieties, Mrs. Pince, Muscat Hamburgh, Black Hamburgh, and Madresfield Court. The last-named variety had received liberal treatment during its swelling period, and abundance of air is admitted to the vinery in which are the Vines when the fruit is approaching ripening, with the result that no cracked berry is ever seen. Peaches and Nectariues looked well, young trees mostly at their full size. Those varieties of Peaches which have afforded the most satisfaction are Dymond, Goshawk, Sea Eagle, Crimson Galande, the fruits attaining large size and high colour. Of Nectariues, Violet Hative, Elruge, and Pine-apple are the most favoured. Figs cultivated in pots fruit abundantly, the varieties remarked being Gros Vert, Osborne's Prolifie, Bourjassotte Blanc, and Monaeo Blanco. The Tomato is extensively cultivated, and the variety Comet, of handsome exterior, appeared to be the fluest cropper. The vegetables observed in the kitchen garden were,

as is usual this year, of great excellence. Hardy fruits are going to receive special attention, and new orchards have been planted. Chrysanthennums have for years been remarkably well grown, and the blooms or the plants have often taken good prizes at important shows.

MAJOR DOBBIE'S GARDEN .-- After leaving this rising place I went to another garden, where it was remarked that many things were uncommonly well done; this was Major Dobbie's residence, also at Larbert. This gentleman has extended his borders, and formed some beautiful pleasure-grounds, a vegetable garden, and erected glass-houses for the cultivation of decorative plants and fruit. The conservatory, a spacious building, was exceedingly gay with flowers in season. Fine Grapes were remarked : also Tomatos growing capitally on a shelf at the back of a vinery, their stems being trained downwards. Bedding-out here receives special attention; and species and varieties of shrubs po-sessing fine foliage are apparently turned to good account. Among the capital crops of vegetables noted were the Cranston Onion. Excellent Goeseberries furnishing a late supply were pointed out by Mr. Wilson. These consisted of varieties not commonly met with in gardens, but which are nevertheless of great value as late bearers; viz, Thumper, a large yellow of fine quality; Crown Bob, very fine: and White Warrington, far from ripe (middle of August, is a capital sort. Mr. Wilsen, the head gardener here kindly gave me much information regarding these fruits and other matters. The Apple crop was a very good one, the result of choosing such varieties only as are best suited to the locality. M. Temple, Carron House Gardens.

TOMATOS TO RIPEN IN MARCH.

It is the practice of some gardeners who require early Tomatos to sow seeds towards the end of the year; but in my experience, the seedlings require so much nursing that the plants are much less strong than they should be. I have for years relied upon plants from seed sown at the end of July or commencement of August for early-spring fruiting. We have so many good Tomatos now in commerce it may seem unnecessary to mention a few as being most desirable, but although there is little difficulty to obtain a set during summer, it requires much care to secure a good crop of fruits in March. Certain varieties are best for this purpose, and after speaking of the principal points to observe in their cultivation, I will mention several of these. I am aware that many cultivators obtain their first supplies of fruit from plants raised from cuttings, but unless the cuttings are extra good, there are serious losses during the winter, and though these may fruit earlier they fail to produce a proper quantity. My chief objection to cuttings as winter-fruiters arose from our great loss during a severe fog in February several years ago. We had a nice lot of plants growing freely, and all were killed; whereas a few seedlings survived, but from what reason I cannot explain, unless it was that they had more roots. We sew the seeds in a cold-frame, and as they grow, the seedlings are given ample room. They are potted up into small pots, and again repotted into 6-inch pots when The seedlings are only kept in a close atmosphere after the first potting from the seed-pans, as it is essential to grow them as hard as possible. The plants are stood on a hard Ash bottom in a cold frame, and the sashes are only used during hot sonshine in the middle of the day to prevent the too rapid drying of the roots, and if very hot a little shade is given; the plants are fully exposed during the night. Towards the end of October or early in November, the cultivator must decide if he intends to fruit the plants in pots or to plant them out. I prefer them in pots, and this necessitates a shift if the plants are becoming pot-bound. This needs eare, and if the plants are repotted, they are theu placed on a shelf or stage in a close atmosphere (but not given heat) until the roots are again active. Water must be given very sparingly until growth is active, for if given heat or moisture freely, the growth becomes too rapid, and the plant will fail to fruit at the required time. If they are not repotted in November, keep them as quiet as possible, exposed to full light and circulation of air. If they are kept in full light, the plants will be about 18 inches in height or 2 feet at the most in January, and when placed in their fruiting quarters good growth will follow. I do not put the plants into the feniting-pots until they are moved to their permanent quarters, but much depends upon the plants themselves, and upon the size of pots to be used. Ten-inch pots should be the largest, for they may be plunged, and the roots will enter the plunging uniterial very readily. We plunge the pots at the commencement, and all this necessitates is extra care in watering the plants. Those that are planted out being in 6 or 7-inch pots are a mass of roots, and should be well soaked previous to planting. We put only a small amount of soil at the start, just enough to cover the roots, in order to limit top growth, and planting may be done in December with eareful watering. The temperature afterwards may be 60° at night with a chink of air 70° during the day in mild weather; but should it be otherwise, a lower temperature both night and day will suffice. From sun-heat a free rise in the tempera ture is beneficial, and ample air, provided cold draughts be avoided. In regard to soil, I advise its use sparingly, and as wireworm may be troublesome, we use the second spit of old pasture soil to escape the pest, at the same time adding a liberal quantity of wood-ashes or burned refuse. During the final potting hone-meal is added, also old mortar rubble if the soil is heavy. Firm potting is important from the first to secure a steady growth, and for the first few months the firmer the growth the more success afterwards. I need hardly add that only one growth to each plant is allowed, and this must be near the glass from early October until the end of December. Our plants are placed upon shelves close to the glass in the fruit-houses at rest, and are merely protected from frost. Our first crop is usually given by the variety Prelude, but I do not advise it as the fruits are very small, its only merit being due to carly fruiting. Conqueror is excellent and early, but not a shapely fruit; and I find a good selection of the Old Red difficult to beat—the fruits are corrugated, but there is a difficulty in getting the best Tomatos to set their blooms in winter. Another excellent winter variety is Early Ruby, this is very prolific, and of good quality and appearance; Frogmore Selected promises well for winter fruiting, being a heavy cropper, and good in all ways. Conference may be relied upon, and though not large, it gives a good crop, and the fruits are of good quality. In respect of any kind, it is well to go over the blooms daily at about noon in order to set them. Prevent a too strong growth; and fumigate on the first appearance of white-fly. G. Wythes.

CONTINENTAL NOVELTIES.

AMONGST several interesting novelties we received some short time since from Fred. Roemer, Quedlinburgh, Germany, were some plants of a double-flowering, dwarf-growing Lobelia. The extraordinary name attached to the plants can searcely be commended for its brevity, though it may be useful to some as a descriptive appellation. Lobelia erinus speciosa compacta duplex has very dwarf compact growth, and the stems and foliage are distinctly purple. The flowers are of large size and double, colour deep blue, and from the plants received is indicated a free disposition to bloom.

Myosotis alpestris "Distinction," of which a number of plants were received in several stages of growth, is described as a seedling from Myosotis alpestris Victoria, and the flowers much resemble that variety in colour and size. The plants were about 6 inches high, and from the dates given at which the several batches of plants were raised from seed, it appears that this variety commences to bloom about ten weeks from time of sowing. It is said to be a capital variety for forcing; and if placed in a greenhouse in

autumn, the plants continue to flower throughout the winter, and are useful for cutting purposes. The accompanying notes state, that if planted in the open ground in autumn, the plant will commence to bloom as early as M. dissitifora, and be much more floriferous. For all purposes in open ground to which the Myosotis is adapted, this particular variety is strongly recommended, and especially for growing in pots.

LAW NOTES.

THE AGRICULTURAL RATES ACT AND GLASS-HOUSES.

THE Justices at Brentford on Monday devoted the day to hearing a number of points under the Agricultural Rating Act, 1896, of interest to market gardeners. They came before the Court upon appeal by the Surveyors of Taxes against the lists prepared by the Assessment Committee of the Brentford Union of what properties were entitled to the benefit under the Act, or help from the Imperial Exchequer. Mr. Horace Page was instructed by the Assessment Committee to support their decisions. The great majority of appeals hinged upon the question whether the glass-houses in market gardens should be considered as agricultural land, and therefore within the scope of the Agricultural Rating Act. Mr. Cooke, arguing for the Surveyors of Taxes, pointed out that section 5 of the Act clearly defined that buildings upon agricultural land were to be exempted from the Act, and the Board of Inland Revenue had issued orders to Surveyors of Taxes that they must construe that section in that light, and that glass-houses must be regarded as buildings. It was agreed on all hands that farm-buildings and out-houses, such as cattlesheds, pig-sties, &c., were exempted from the Act, and so therefore glass-houses, which come in the same category, should be. They were built on brick foundations, with doors of wood and glass, and brick chimneys, and if that did not constitute a building, he did not know what would. It had been argued that if the view of the Inland Revenue were correct, market gardeners would derive no benefit from the Act; but with that he had nothing to do, but to point out it was a fallacious view, as they would get something allowed on their open garden-land.

For the respondents, the Assessment Committee, Mr. Page contended that the judgment in Purser v. The Worthing Local Board governed the case. That case was very clear. A market garden was, under the Agricultural Rating Act, included in the definition of agricultural land, and the judges in the Worthing Case held that a garden was no less a garden because glass was put on it for the purpose of adding the production of fruit and vegetables.

The Chairman of the Bench, interposing, enquired if in the Worthing Case the glass-houses were movable, or fastened to the ground by foundations.

Mr. Page rejoined that that point did not arise, but, as a fact, the glass-houses in Worthing were of brick foundation.

Mr. Cooke, replying on this point, urged that the Agricultural Rates Act should be taken as commencing the question of glass-houses de novo, and therefore it was not governed by the case cited.

The Bench dismissed the appeal, and confirmed the Assessment Committee's decision, the Chairman stating that they had the clear definition of a garden in the Act, and a very clear judgment of the High Court upon the position of glass-houses as affecting the status of the garden. That judgment they could not go behind. They allowed costs against the Revenue.

Another point of interest arose in connection with the famous Syon Gardens. The Assessment Committee had scheduled the Duke of Northumberland as entitled to come within the Act in regard to a piece of garden-land separated from the main gardens by a wall, and a Willow-bed abutting on the Thames.

Mr. Cooke argued that the garden-land was part of the curtilage of Syon House kitchen garden, and the Willow-hed was in the same position, and in the alternative that the wall round the garden must be valued separately as a house or building, and deducted.

Mr. Page replied that the garden, being separated from the kitchen garden, was no part of the curtilage of the house, and to define a small wall as a building was absurd; and that the Willows were cultivated and sold, and this constituted a garden as much as did the growing of Rhubarb for sale in a market garden.

Evidence was taken as to the position of the garden, and the Court held that it must be regarded as part of the kitchen garden. The value put upon it was £2, and that sum they would deduct from the assessment as of the whole. They could not regard the wall as a building, and Willow-beds, such as those, cultivated for profit, were fit to be included in the operation of the Act.

SOCIETY.

IRISH GARDENERS' ASSOCIATION.

Discussion 9. The tercentenary of the introduction of the Pot ito into the British Isles was celebrated on Wednesday and Thursday by the holding of a Conference of the Irish Gardeners' Association, and an Exhibition in the Rotunda. Specimens of every description of the plan; were displayed, also garden-tools and chemicals, which of late years have played an important part in the cultivation and preservation of the crop. The commemoration was organised by the Association, the President of which, Mr. A. G. Watkins, of Merrion, in proposing that Lord Powerscourt should preside, said that the Association felt proud of having got together such an exhibition of Potatos as had never been seen in Ireland before, and probably not in the world. They hoped that not only would it be a suitable memorial to Sir Walter Raleigh, but that the fruits of their labours would be of material benefit to the people by improved knowledge of cultivation and the introduction and trials of newer varieties. They hoped ultimately to stamp out the dread Potato disease. They proposed as a memorial to S.r Walter Raleigh, and to commemorate the tercentenary of his introduction of the Potato, to establish a Gardeners' Benevolent Fund for Ireland,

Lord Powerscourt said they were met to celebrate the fact that 300 years had clapsed since Queen Elizabeth's great courtier. Sir Walter Baleigh, conferred upon Europe perhaps two of the greatest benefits that they knew of, namely. Tobacco and the Potato. Ireland was fitted, with her mild climate and fertile soil, for the production of many things of great use of the soil was properly cultivated. He understood that it was contemplated to try a vineyard in the south of Ireland, and he thought it was worth trying. Papers on subjects connected with the cultivation of the Potato were then read by members of the Association. Traces.

Messrs, Surroy & Sons, of Reading, made a most extensive exhibit, occupying a space of 400 square feet. The display methoded 200 distinct varieties, embracing thirty-five varieties which have been distributed by the Reading firm, 32 seedling varieties now under trial, but not yet in centurere. 136 other varieties of miscellaneous origin, and six botuneal species which have been proved to be of no commercial value. We hope to refer more fully to this event in our next issue.

Obituary.

W. R. BAKER.—The death, on the 29th ult., at the age of 86, of this gentleman is announced. He was an enthusiastic and well-informed gardener, as the pinetum, rockery, and collections of herbaceous plants at Bayfordbury give testimony. The pinetum is one of the richest in the south of England, and the " old squire" was full of information concerning his trees. Many memorial trees have been planted by members of the family of different generations. These afford interesting studies of the rate of growth, the species of tree selected being in each case the same. Bayfordbury is one of the very few places in which we have seen very numerous seedling Collars of Labanon come up spontaneously all over the lawn. A correspondent of the Times writes :- "Mr. Baker was a lineal descendant of the second Jacob Tonson, nephew of and partner with the 'great' Jacob Tonson, the friend and publisher of Dryden and the leading wits of the period. The second Jacob's eldest daughter married Alderman Baker, father of Sir William Baker, whilom M.P. for Hertfordshire. Mr. Baker's possession of the spleudid series of portraits by Sir Godfrey Kneller is accounted

for by the fact that Jacob I. was the originator and chief spirit of the Kit Cat Club, which was formed in 1688 by the leading Whigs of the day; it was first held in Shire Lane, afterwards christened Lower Serle's Place; thence it migrated to the 'Fountain Tavern in the Strand; and thence, early in the last century, to a small house adjoining the mansion of Barn Elms, near Barnes. Phillips in his Morning's Walk from London to Kew, 1817, found that the club-room still existed in almost the same state as when the patriotic Whigs held their revels there a century previously. The Kit Cat portraits, forty-two or forty-three in number, were so called from the name adopted by this club, and originally hung in this room, and each measures 36 inches long by 28 inches wide. They begin with Kneller himself and end with Jacob Tonson. Old Jacob bought an estate in Hertfordshire about the year 1720, and died there in 1736. Jacob the second, his nephew, predeceased him by about four months, dying at Barnes in N ember, 1735. When the Kit Cat Club dissolved, old Jacob acquired the pictures by purchase or otherwise, and they have since remained in possession of the family.

JOHN LORAINE BALDWIN. - One of those fine old English gentlemen, of which so few now remain, has passed away, and was buried at Tintern on Tuesday. He had been for twenty-three years the Warden of Tintern Abbey. He was born June 1, 1809, and died in his eightly eightly year, on November 25, 1896. In 1873 he married Lady Francis Russell, widow of the late Lord Francis Russell (and sister of the late Sir Thomas Peyton, Bart.), who died on February 2, 1888. Mr. Baldwin was a great lover of, and an extensive cultivator of plants, his specia. favourite being the Carnation. He had a long border at St. Ann's, his Tintern residence, and he grew hundreds more in his garden at Neath Abbey; he had also a large collection of herbaceous plants, and took great interest in Ferns. His familiar, good natured face was to be seen at all the London flower-shows, and he seldom omitted those at Bath and Bristol. In 1845 he, together with the late Lord Bessborough, the Hon. Sir Spencer Ponsonby-Fane, Gen. Sir Henry de Bathe, and others, formed the I. Zingari cricketclub, of which he was made Vice-President, a post he held up to the time of his death. The Marylebone Cricket Club presented him with a handsome conservatory, on which was a tablet containing the name of the Prince of Wales, and that of all the other members; this conservatory was filled with a choice collection of plants, and was always a blaze of bloom. Botanists and horticulturists were con stantly at Tintern, and had always a welcome.

He was passionately fond of cricket, and took very great interest in the doings of the Kent and Middle-sex county teams. He had also much to do with the formation of some of the London clubs, so that he was known by the title of "King of Clubs" among his intimates. In all manly English sports and pastimes his name has been very prominent.

Mr. Baldwin, in his house at St. Ann's, was marked by a geniality and benevolence of nature that is as rare as it is welcome. He kept Tintern Abbey in splendid condition, and at the time of the Jubilee, in 1887, he held a service there at which the Bishop of Llandaff preached, and a cathedral choir chanted hymns of prayer and praise, the sounds of which can never be forgotten as they soured upwards through the roofless Abbey.

The friends of Mr. Baldwin were so numerous that it was not to be wondered that so many attended the fineral, or that a hundred wreaths were sent to St. Ann's.

Every room in his house at St. Ann's, Tintern, and in that at Dover, was a perfect imiseum, and interesting to every one as representing every year facts for a century; and his cups, and vases, and glasses of flowers on every table representing all flowers in season, was a perpetual flower show. Mr. Baldwin was the possessor of the finest British Fern yet raised, known as Polystichus angulare v. Baldwin. It was presented by the late Colonel Jones at the Bath Fête of the British Association in 1888, at that time too young to have attained its permanent charman.

racter; but in 1890 it was exhibited at the Royal Horticultural Society, and awarded a First-class Certificate, being admired by every one. This plant, we learn, is now the property of Mr. E. J. Lowo, having been left to him in Mr. Baldwin's will.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of bours.)

SEEDS.

London: Dec. 9.—Messes. John Shaw & Sons, See I Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's seed market, as is enstomary during December, was dull and uninteresting. Clover and grass-seeds, although failing just now to find buyers, keep steady in value. Continental and Canadian markets are cabled strong. Full prices are asked for Mustard and Ripe-seed. As regards Haricot Beans the tendency of quotations is upwards. Blue Peas show no alteration. The new Californian Butter Beans, proving good and cheap, meet with increasing favour. For Charry and Hemp-seed the demand is just now restricted to narrow limits.

FRUIT AND VEGETABLES.

GLASOOW: December 9.—The following are the averages of the prices current at market during the past week:—Fruit: Pears, 6d per lb.; Apples, 1s. to 2s. 6d. per stone; Tomatos, Ginernsey, 5d. per lb.; do., Scotch, 63d. do.; Grapes, home, 1s. to 2s. do.; do., foreign, 4d. to 6d. do. Vegetables: Turnps, white, 2s. to 2s. 6d. per dozen bunches; Swedes, 1s. to 1s. 2d. per cwt; Savoys, 1s. to 1s. 3d. per dozen; Cabbages, 3d. to 9d. do.; do., late, 11d. to 1s. 6d. do.; do., Red, 2s. 6d. to 3s. do.; Caulitlowers, Dublin, 2s. to 2s. 6d. per dozen; Parsnips, 4s. 6d. per ewt.; Herbs, assorted, 1d. to 2d. per bunch; Leeks, 1s. 3d. to 2s. 6d. per dozen bunches; Mint, 6d. per launch; Checks, 1s. 3d. to 2s. 6d. per cwt.; Parsley, 5s. to 6s. do.; Greens, 4d. per bunch; Celery, table, 2s. per bundle; do., common, 9d. to 1s. do.; Potatos, best, 8d. per stone; Carrots, 2s. 6d. to 3s. 4d. per cwt.; Artichokes, 1os. to 14s. do.; Cheumbers, 4s. to 4s. 6d. per dozen; Lettues, 6d. to 9d. per dozen; do., French, 9d. to 1s. do.; do., Cos, 9d. do.; Radishes, 9d. to 1s. per doz, bunches; Horseradish, 2s. to 3s. per bundle; Mushrooms, 1s. to 1s. 3d. per lb.; Beetroot, 6d. per doz.; Cress, 3d. per basket; Brussels Sprouts, 1s. 6d. to 1s. 9d. per stone.

Laverroot: December 9.—North Hay Market: Turnips, 18s. to 19s. per ton Potatos: Imperators, 1s. 9d. to 2s. 2d. per ewt.; Giants, 1s. 9d. to 2s. do.; Main Crop, 2s. 3d. to 3s. do.; Champions, 1s. 9d. to 2s. 2d. do.; Sutton's Abundance 1s. do.; Bruces, 1s. 9d. to 2s. 3d. do.;

"He that questioneth much shall learn much."-BALON.

WHAT VARIETY OF GRAPE-VINE IS LIKELY TO SUCCEED ON GROS MAROC OR GROS COLMAN SUCCEED ON GROS MAROC OR GROS COLMAN'

—7: S. would be glad to know if any reader of the Gardeners' Chroniele would tell him what early varieties of the Vine are likely to succeed when inarched upon Gros Maroc or Gros Colman, and if any late ones have been known to succeed when inarched upon Black Hamburgh' Is Buckland Sweetwater useful as a stock for other varieties

NOTICES TO CORRESPONDENTS.

- APPLE CANKER: R. N. A good specimen of Apple canker (Nectria ditissima), showing the fungus in situ. Of the numerous specimens we receive we very rarely see one with the fungus present. It kills the branches. Cut out all the discased branches and burn them. The fungus spores enter by means of cracks in the bark, caused by frost or any other can-e.
- ASPIDISTRA LEAVES WITH SPOTS UPON THEM: G. E. We are unable to guess the reason for the spots, as you furnish no particulars. Can you send a leaf or two, or a whole plant for inspection !
- BEAN LEAF: F. C. F. We find on your leaf some white scale, which cannot be reached by vaporisers. Try washing with weak petroleum emulsion. Burn the affected cases.
- BEET FOR MARKETING: St. Andrew's. Any good recognised dark - fleshed symmetrical variety is suitable for market use, as Cheltenham Green Top. Nutting's Dwarf Red, Dewar's Dwarf Red, &c.; and the Egyptian for very early use.
- CARNATION LEAVES: T. II. S. Your leaves are affected by a fungus (Helminthosporium) often described and figured in Gardeners thronicle. Burn all the affected leaves, and wash the plants with a very weak mixture of Gishurst compound.
- CATTLEYA-LELIA CROSS: A. de L., Liege. Vour Lælio Cattleya × is a tolorably pretty variety. It resembles in most respects L. C. Wellsiana, which is a cross also between a variety of Cattleya Trianæi and Lælia purpurata.
- CHRYSANTHEMUM SPORT: H. R. Woodcock. If the flower you send was produced by a plant of W. K. We cannot Woodcock, it is a sport undoubtedly. recall a variety named W. " N." Woodcock.
- Correction: Edinburgh Chrysanthemum Show. For the words Mr. Kirk, of the Forth Vineyards, read Messrs. D. & W. Buchanan, &c.
- FERN: G. M., Arbroath, N.B. The photograph is that of a young plant of Stenochlæna Meyeriana, J. Sm., and the specimen is a sterile frond of the The fertile frond bas very narrow pinnæ, and is quite different from the sterile frond, which also when mature, has more pinne than on the specimen sent. It is a native of the East Indies and the Malayan Islands, and is a remarkably handsome basket and rockery Fern. In its present state, your frond looks like S. tenuifolia, Moore,

which, at best, is but a variety of S. Meyeriana, if not the same species.

- GRAPE ALPHONSE LAVALLEE: X. Y. Z. There is such a variety in cultivation, but we are unable to give you any information concerning it.
- MITES ON APPLE BARK: Apple Bark. The acari are the nymphs (-active pupe) of Oribata lapidaria. I do not think that they would injure the Apple-tree. They were probably feeding on minute lichens or fungi growing on the bark. .(. D. M.
- Mushrooms: Constant Reader. Either the spawn was old, or you have blundered in the management of the bed. The flus, of which "myriads exist in the Mushroom house, may be killed by fumigation with tobacco, or some of its preparations. Old Mushrooms commonly get fly blown, and the resulting maggots pierce them in all directions. Do not allow them to get old, unless you can grow them out-of-doors in the winter, where, of course, there are no flies to give trouble.
- NAMES OF FRUITS: Hythr. Pears are not sufficiently sound. Enquirers should give their names and addresses. - Thomas Denny. Your Pear is Uvedale's addresse,—Laones Penny. Your Pair is Cvedale's St. Germain, or Belle Angevine of the French.—
 N. A. C. 1. Easter Beurré; 2, Beurré Diel; 3, Mère de Ménage; 4, Lady Henniker.—C. H. 1, Bergamotte d'Esperen; 2, Olivier des Serres.—W. Dodyc. 3, Braddick's Nonpareil; 4, Sturmer Pippin; 5, Waltham Abbey Seedling; 6, Flemish Beauty.—B. & Co. Can you send further specimens? mens
- NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.— $H,\ B,\ M.$ Cosmos bipinnati bilus.— $L,\ F,\ P,\ 1$, Abies nobilis; 2, Tsuga Sieboldi; 3, Abies Lowiana; 4, Juniperus virginiana var.; 5, Libocedrus decurrens; 6, Juniperus sinensis; 7, Thuia Biotal orientalis. We do not think the same insect would attack both Celery and Onions.—W. N. R., Northampton.—1. Eschynanthes Lobbianus; 2, Reineckia carnea variegata; nanthes Lobbianus; 2, Remeckia carnea variegata; 3, Dictyogramma japonica; 4, Croton Weismanni; 5, Croton interruptus.—H. F. G. Othera japonica is the same as Ilex Othera. We never saw it in fcuit before.—W. O. W. I. Arbutus Unedo; 2, Not found; 3, Libonia floribunda; 4, Berberis Aquifolium; 5, Hypericum calycinum; 6, Rhododendron ferrngineum.
- OUR ALMANACK: Contributor. We insert all the fixtures we know of up to the date of publication. The Rontgen rays have not as yet enabled us to publish the dates of meetings, &c., before they are decided on.
- RATING GREENHOUSES, &c. A. F. Read the account of recent cases given in last week's issue of the Gardeners' Chronicle, p. 692, and in the current number.
- WORM C. F. W. The common hair-worm, Gordius agnations. It is an article of faith with some that these worms are developments of horse-hairs which take on new life in the mud of the ponds in which they are usually found!
- X L ALL: Constant Reader. If the directions accompanying the liquid are adhered to, it is said that no injury is done to plants by its use. Without having seen the plants before and since the waporising was done, we can form no opinion regarding the fall of the blooms of Enphorbia, or the browning of the fronds of the Adiantum Williamsi and A. Farleyense.

HEATING APPARATUS DEPARTMENT. HYGIENIC HEATER.

Bruning Paraffin or Gas without smoke or smell. These Heaters are constructed as a means of Heating by Hot Air without the use of hot water or lires. Its peculia construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this Stove, and nothing whatever injurious to plants, but actually everything conducive to their health, if should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in sloves of other systems. See list for full description.

AND SIXPENCE FOR EVERY ADDITIONAL LINE If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

Advertisements guaranteed to appear on the front page are charged at the rate of 1s. per line, head line counting as two lines. No display is allowed.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d, for every additional line (about nine words) or part of a line. These Advertise-ments must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

Notice to Advertisers.—In many instances Remittances in Payment of Repeat Adverlisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. Cove, as, unless the number of a Postal Order is known, and it has been mude payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WHLLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postuge, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. Cove.

Si bacribers who experience any difficulty in the taining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with

ORDERS. REDUCED PRICES.

When you make out your Seed Order include the Best and Cheapest Insecticide for Funigating, viz.:—

Complete in themselves, without lamps or spirit. Ready for use at any moment. S { Complete in themselves, without is mps or spirit. According to the old prices:— CAMPBELL'S

No. 3 Rolls, for 1000 cubic feet of space ... 8d. each. No. 2 Rolls, for 500 cubic feet of space .. 5d. each.

No. 4 Rolls, for 2000 cubic feet of space . . . 1s. 2d. each.

Direct from us or from any Seed or Nursery Firm with whom you deal.

The fumes from these Rolls being of greater specific gravity do not pass away through the openings there may be in roofs, nearly so quick as vapour does, Insects are therefore exposed to their deadly influence for a longer time during the fumigation.

NO INJURY TO PLANTS, FLOWERS, or FRUIT.

For Dipping or Syringing, order LEMON OIL, which has been before the Public now nearly ten years: —

Half-pints, 1s. 6d.; Pints, 2s. 6d.; Quarts, 4s. 6d.; Half-gallons, 7s. 6d.; Gallons, 12s. 6d.

CLIBRAN & SON, ALTRINCHAM, AND 10 & 12, MARKET STREET, MANCHESTER.

AND SIXPENOE FOR EVERY ADDITIONAL LINE. If set across two Columne, the lowest charge will be 20s. if set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

Advertisements guaranteed to appear on the front page are charged at the rate of 1s. per line, head line counting as two lines. No display is allowed.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertise-ments must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each Insertion.

Notice to Advertisers.—In many instances
Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remit-ting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. COVE, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STEBET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.

Subscribers who experience any difficulty in ch-taining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint.)

THE

Gardeners' Chronicle.

SATURDAY, DECEMBER 19, 1896.

HELIGAN, CORNWALL.

"IIIE history of the Tremaynes, of Tremayne, forms no inconsiderable portion in the long and interesting annals of the county of Cornwall; few families have more worthily maintained the leading position which they have held in the westernmost county from time almost immemorial.

The manor of Tremayne, situate in the parish of St. Martins-in-Meneage, on the banks of Helford-Haven, is said to have given name and origin to the ancestors of Perys or Peres Tremayne, who resided there, temp. Edward III. John Tremayne, of this family, who was sheriff in 1486-87, had a brother called Richard, who resided at Tregonan, and who is thus noticed by Carew: "At the adjoyning Saint Tue St. Ewe) dwelleth master Richard Tremayne, descended from a younger brother, of Calocumbhouse in Devon, who being learned in the lawes, is yet to learne, or at least to practise, how to make other proffit thereby, then by hoording up treasure of gratitude, in the mindsfull breasts of poore and rich, on whom he, gratis, bestoweth the fruites of his paines and knowlege." Another distinguished member of the family, Lewis Tremayne, commanded a regiment of foot for Charles I., and was Lieutenant-Governor of Pendennis Ćastle.

The maner of Heligan was, at an early period, the property of the Heligans, from whom it passed by female heirs to the Tregarthians and Whitleighs; and from the latter by co-heiresses to the families of Grenville and Hals. One of the Tremaynes purchased the property at a very early date, probably during the earlier years of the sixteenth century. William Tremayne began to build Heligan in 1597, and first inhabited the house in 1604. Sir John Tremayne, Serjeant-at-Law, towards the latter part of the seventeenth century made some additions; the Rev. H. H. Tremayne considerably altered the house in 1809; and his son, Mr. J. H. Tremayne, subsequently improved upon these alterations. The house, from an architectural point of view, has very little that is either striking or beautiful about it-it is severely plain, but large and substantial. Standing, as it does, however, amidst exceedingly beautiful scenery, Nature has more than fully compensated for defects which are after all merely a matter of detail.

The gardens are among the most interesting in this part of the county, at least three generations of Trem types fairly claiming the distinction of being described as ardent horticulturists. The late John Hearle Tremayne, father of the present owner, introduced a great variety of new improvements in the gardens, and made the drive one of the finest in the county, in 1832. Heligan may be almost described as the birthplace of Cornus capitata (Benthamia fragifera) Sir Anthony Buller, in the early part of the century (about the year 1825, it is believed, gave Mr. J. H. Tremayne some seeds which he brought home from Nepaul, it native habitat. In the genial soil and climate of Heligan they grew and thrived amazingly, and when Mr. Tre-mayne made the drive in 1832, he planted this splendid tree on either side, with the result that from early summer till autumn the drive is simply a dense mass of white flowers. Bamboos are a strong and exceptionally interesting feature at Heligan, where they thrive, for the most part, in the wildest profusion. The largest pilce is E. Simouii, which was planted about the year 1871; B. nobilis is also in large clumps, and appears to have been first planted here in 1874. Mr. John Claude Tremayie, son of the present squire, and an enthusiastic amateur, has alded all the varieties which he has been able to get in Europe during this last year or eighteen months, some of the rarer or less-known forms of this protean genns having been secured after much difficulty from murseryman in Italy.

The Indian Rhododendrons at Heligan are a great feature, and are well worth a journey all the way to Cornwall to see. The majority of the larger specimens were planted by Mr. John Tremayuc some years ago. As the majority of these are figured in Sir Joseph Hooker's splendid folio, dealing with the Rhododendrons of the Sikkim Himalayas, it is most interesting to compare the plates in this work with the results of careful and intelligent culture in an entirely congenial habitat. The flowers are in nearly every instance finer, and the colours more brilliant. R. Griffithianum, syn. [Aucklandi], for in-tance, is an exceedingly fine plant, and the flowers, which me sure from 3 to 5 inches and over in diameter, are, when first out, pinker than is usual with this species-in either its natural habitat or in other places. R. Thomsoni Hooker, t. xi., remarkable for the almost unrivalled deep blood-red colour and glossy surface of its flowers, is quite 25 feet high, and is probably the largest plant of this species in England. Sir Joseph Hooker describes this in its native labitat as a bush ranging from 6 to 10 feet high, " or in damp woods 15 feet high, but then spare and woody;" at Heligan it attains to tree height without being either spare or woody. Of R. Falconeri, of which an illustration from a photograph taken by Mr. J. Claude Tremayne, is here given fig. 130, p. 749), there are two large specimens; the younger of these is about 15 years old; and in April and May of this year it produced a record total of 255 flowering heads-one of these heads was 362 inches in circumference. This striking and distinct species, with its densely-packed flower heads, and beautiful Magnolia grandiflora-like leaves, is also figured by Sir Joseph Hooker; but the plate does not give an adequate idea of the extraordinary beauty of this species as seen at Heligan. R. Hodgsoni Hooker, tab. xv., found at an elevation of from 10,000 feet to 12,000 feet in all the valleys of Sikkim, also thrives exceeding well at Heligan; of the wood of this species, Sir Joseph Hooker states, cups, spoons, and ladles are made by the Bhoteas, and universally the little "Yak" suddle, by means of which the pack-loads are slung on the back of their animal. R. Campbelliæ now (referred to R. arboreum) fig 134, p. 757 a flowering branch of which an illustration is here given, may be mentioned not only for it- heauty, but for its free flowering character; R. glaucum with its sweet cented foliage, and R. fatmosum syn. Gibsoni, are all here, and all in great size. There are also two good-sized P. zevlanicum aboreum, but they have never flowered.

A fine specimen of Eriobotrya japonica came originally from the south of France, and has acclimatised itself exceedingly well at Heligan, where it does best in a book not far from water. Another plant, half-hardy elsewhere outside Cornwarl, Hedyehium Gordnerianum, has been in its present place by the side of the stovelhouse for very nony years; it finited last year, and Mr. Tremayne vaised several plants from the

seed. Berberidopsis corallina is also quite hardy; Solanum jasminoides, which was actually touching the Berberidopsis, was killed two years ago, though other plants of the Solanum in other parts of the garden were not hurt. A very old plant of Camellia reticulata is still a profuse bloomer, and bears hundreds of huge flowers annually: this past season it was a red blaze. Lapageria rosea flourishes, and produces flowers in great abundance; whilst Tropa blum speciosum, a singularly beautiful plant, is equally hardy, and equally free flowering—essential points in its cultivation are plenty of room and a west wall.

There are about a dozen plants of Dicksonia antarctica in the open at Heligan; the largest was put in three or four years ago, and the remainder, which are comparatively small plants, were placed in the rockery a few months ago, and form an exceedingly charming addition to an artistic formation.

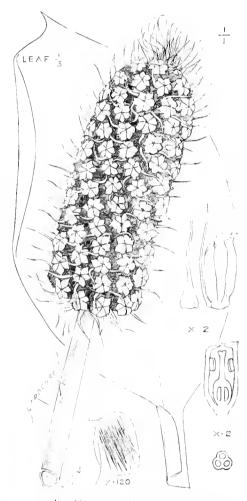

Fig. 129.—confostypha eccomonds.
(Flowers green, bracts yellow; leaf reduced; thord details magn; at the bise is a large cell filled with raphides.)

These plants were brought over from Sydney by Mr. J. Treseder, of Truro, and, so far, have shown no illeffects of their long journey. I may here mention an exceptionally fine specimen plant of Chamerops excelsa, which was planted by Mr. John Tremayne between 40 and 45 years ago, and is now over 20 feet in height; there are several other plants of this graceful Palm, but none so large or so old as the above-mentioned.

There are very many interesting trees at Heligan, notably Pinus Ayacahuite; this was given by Mr. J. Knight, of Chelsea to the late Mr. J. H. Tremayne, over 40 years ago, apparently soon after its introduction into this country, as it was first brought to England in 1840 by Hariweg for the Royal Horticultural Society. The illustration (fig. 131, p. 751), from photograph taken by Mr. J. C. Tremayne, gives a very good idea

of this very beautiful tree; this specimen is believed to be the finest in England, and it is quite hardy. The illustration of the cones of this plant will also be interesting (fig. 132, p. 753), as they are of rare occurrence in this country. There is also a good specimen of Pinus montezumæ, which was given to Mr. Tremayne by Mr. Jonathan Rashleigh of Menabilly a few years ago, and grown from seed saved by him. In a valley below the house is a very specimen of Abics nobilis, about 66 feet high, girth 3 feet from ground, 6 feet 10 inches, at base 8 feet. This valley was quite a wild orchard until the present owner of Heligan began planting some rarer kinds of trees there; it is now an arboretum of a most interesting characterindeed, it may be doubted whether there is a more successful garden lover in the county than Mr. John Tremavue.

Any reference to Heligan would be quite incomplete without mentioning the little enclosure known as Mrs. Tremayne's Garden. This is a very charming enclosure, of about a quarter of an acre, filled with all kinds of old-fashioned flowers, which produce a gay succession from January to December—

"The daughters of the year, One after one, thro' that still garden pas'd; Each garlanded with her peculiar flower Danced into light, and died into the shade."

Mrs. Tremayne's garden more nearly approaches my own ideal of what an old English flower garden eught to be like than anything I have ever seen; it is certainly a most interesting and charming addition to the attractions of Heligan. W. Roberts.

NEW OR NOTEWORTHY PLANTS.

GONIOSCYPHA EUCOMOIDES.*

This is not a pretty name, and a good many people would give the same verdict to the plant that bears it. But though good looks cannot be claimed for it, it possesses what is more important-interest. The plant is near to Tupistra and Aspidistra among the Liliaeex. Its general appearance is shown in the accompanying illustration (fig. 129), taken from a specimen that flowered recently in the Royal Gardens, Kew, to the authorities of which establishment we are indebted for the opportunity of figuring the plant. The leaves are broad, and emerge from a fleshy root-stock, from the top of which also emerges the cylindrical scape bearing the spike of deep-green flowers. The uppermost bracts are barren, deltoid, acuminate, yellowish, forming a tuft above the flowers, as in the genus Eucomis. The perianth consists of six obtuse fleshy hooded segments, united below the middle, concealing as many stumens. Ovary, three lobed. The fruit is described as a "borry." It is a native of the Bhotan Himalaya, and was originally described by Mr. Baker. M. T. M

ORCHID NOTES AND GLEANINGS.

DENDROBIUMS GROWING UPON BONES.

A rew days ago the opportunity was afforded me of inspecting the small and well-grown collection of Orchids formed by A. W. Wills, Esq., Wylde Green, and there saw what I should think is a remarkable instance of an Orchid growing upon the skull of a sheep, the species being Dendrobium Parishii, which from the size of the old pseudo-bulbs, was a very small piece when fastened to the skull. This is its second year of growth, and the length and stoutness of the new pseudo-bulbs, the extensive network of roots around the jawbones and teeth, in and out of the eye-sockots and other indentaions of the skull, show plainly that the bone suits its requirements. Equally luxuriant is a plunt of D. pulchellum growing on the skull of a dog; where in general instances the bulbs usually attain a length of 3 or 4 inches, the plant under notice has this season made balbs approaching 7 inches in length.

^{*} Gonioscypha encomoides.—Baker in Joaca, Lean. Soc., 1875, xiv., 581, t. 19; N. E. Brown in Gard. Chron., 1886, ii., 744; J. D. Heck, in Flora of British India, vol. vi. (1892), p. 326.

This information may at the present time be all the more interesting as it will materially strengthen the arguments put forth by Doctor Kedzie, and published in the Gardener's Chronicle of November 28, that the growth of epiphytal Orchids is stimulated by their absorbing mineral matter through the agency of their roots. I. I.

DENDROBIUM WARDIANUM AT HIGHBURY.

Under the fostering care of Mr. Burberry, the Dendrobiums at Highbury, Birmingham, have done exceptionally well this season. Out of the large number of D. Wardianum that are grown here, there are few new bulbs that have not attained a length of 4 feet, and promiseuously selecting one, 1 counted twenty nodes with flower-buds, which cannot fail in a few weeks' time of being a "show in themselves." I.

MASDEVALLIA TOVARENSIS.

In the cool houses of H. J. Stevens, Esq., Westmount, Kelvinside, Glasgow (gr., Mr. David Wilson), is a fine specimen of Masdevallia tovarensis, with fifty spikes of its paper-white flowers; each of these spikes will have from two to three flowers, and the effect is enchanting to an Orchid enthusiast. This pretty species, once scarce and dear, has become so plentiful as both to minimize its value and importance. However, well-cultivated plants, abundantly bloomed, command attention, and this being an individual plant, not made up, one looks to see how it has been grown. It is growing in a 7 inch pot, in peat and sphagnum-moss, in the ordinary way, so that it is evidently a question of climate that accounts for the successful flowering of the plant. There is no finergrown lot of Odontoglossum crispum in Great Britain than the lot under the charge of Mr. David Wilson. The writer saw the collection in its earlier days, and the plants now are in specimen size, and the pseudobulbs rather increasing than otherwise, so that the coolish moist climate that grows these Odontoglots so well, does the same for the Musdevallia tovarensis. The leaves are broad, per-green, and without blemish, and the whiteness of the flowers, and the number of them, contrast well with even the great racemes of O, crispum itself. J. A.

ANGRECUM SESQUIPEDALE.

One of the best grown pieces of this singular-looking Orchid is grown in a stove in Mr. Stevens' garden with marked success. The plant is about 2 feet high, and is furnished with leaves to the bottom with thirteen pairs of leaves, strong with that fine glaucous covering that provides the green which is so pleasing to the eye. It is showing four spikes of bloom of three flowers each. One can see that this species revels in the atmosphere strongly tropical among a host of Dracenas and Crotons, the moisture arising from them, independent of any subsidiary influence, contributing mainly to vigorous growth, and at the same time furnishing stamina for long life. Many tropical Orchids do best under similar circumstances as to miscellaneous fellowship. J. A.

ODONTOGLOSSUM - ANDERSONIANUM VAR.

A very pretty and distinct form of this extremely variable natural hybrid Orchid is in flower at Mr. F. C. Jacomb's gardens, Cheam Park, Surrey. The whole of the segments are broad; sepals, petals, and lip being rather more than half-an-inch wide. The sepals and petals are in colour of a cream white, with irregularly formed reddish-brown markings on the inner halves. The column corresponds in colour with the sepals and petals; but in the labellum, which is nearly triangular, there is an unusual departure from the ordinary colour arrangement, it being wholly of a clear white, with a bright chrome yellow area at the base. The two-horned callus is also white, and the unspotted lip, contrasted with the brightly marked segments, make it an attractive flower. J. O.B.

PLANT NOTES.

NEPENTHES - DICKSONIANA.

Among the plants grown by Mr. George Ru sel, the gardener to J. B. Mirrilees, Esq., Redlands, Kelvinside, Glasgow, the collection of Pitcher-plants, and

the method of culture pursued, have been notable for years; and there is no more striking species than Neperthes — Dicksoniana, which is a seedling of Rafflesiana — Veitchi. There are several plants here in great vigour. It more resembles in the appendages N. Rafflesiana than N. Veitchi, but the leaves of the pollen-parent are discernible throughout. It has also the rather short joints of N. Veitchi in the leaves, which is an improvement on the Rafflesiana habit. Its pitchers are much elongated and handsome, the marbling of the body of the pitchers being like those of its seed-parent; and then the operculum, or lid, is very ornamental, the turned-down margin being beautifully and irregularly striped transversely with dull crimson.

Fig. 130.—RHODODENDRON FALCONERI (SEE P. 745)

Nepenthes Rafflesiana remains one of the freest-growing and most prolific in pitchers of the strong growing bulky section. The plants here are in perfect health, and one of the pitchers was large enough to hold the contents of a large soda-water bottle, which give those who drink, and those who do not, a fair idea of the capacity of an abnormal tendrilified leaf. The green and the brown forms of N. Masters iana are well in cyidence, and many other sorts.

The mode of propagation which Mr. Russel adopts with Nepenthes is to cut a piece off, widen the hole of a 3 inch pot, draw the cutting through it inversely, leaving the empty pot to do the callusing and rooting processes, placing these inverted pots in a frame in the stove, whence rooting takes place, without a single morsel of sphagnum-moss or foreign matter of any kind, in a comparatively short time, and with invariable success,

ADIANTUM FARIETERSE.

Amongst the many fine things to be found in the glass-houses of Sir John Watson, Bart. of Earnock, Hamilton (gr., Mr. J. Moir), the collection of Adiantum Farleyense stands out prominently. It evidently requires a moist climate and strong heat, and to be kept rather near to the glass. There are about a dozen specimens of this Fern in the Earnock stove, and each is as good as the other. No other Maidenhair can rival A. Farleyense for effect. Unfortunately, it will not stand use in a drawing-room, and even the fronds when cut from the plant soon shrivol: but as a specimen, its light from are admirable. Mr. Moir does not afford this Ferns large pots, and the fronds coming up at the present shows that it is a perpetual grower—otherwise evergreen. J. A.

THE DEODAR AND OTHER CONFERS.

IF Mr. Nicholson said or wrote that the Deodar was practically a failure generally in this country, he stated what may, in fact, he acknowledged as a truism. Earl William, grandfather of the present Earl Craven, planted Deodars largely alongside of a plantation, in various soils and in various sheltered situations. These were planted, as nearly as I can make out, about fifty years ago. Whilst young they grew tolerably well, so that thirty five years later we telt encouraged to plant more. These, in turn, did very well, but of late years, on the visitation of severe frosts, branches were killed back a yard and more in length. The following spriog these broke again strong from the live wood, but only again to be kided back, until the whole of our Deodars presented a most miserable appearance, a very different state of affairs to the healthy state the tree assumes in its native home, or in some of our more favoured districts. The failure of the Deodar here may probably be accounted for by our low altitude -250 feet above the sea level; yet at the same level Larch planted at the same time, and on precisely the same soil and surroundings, are a decided success. Cedars, C. atlantica, planted side by side with Deodars, have grown into magnificent straight healthy trees, whilst the Deodars are only gnarled and sickly.

Of Wellingtonias I have a better tale to tell; in the grounds here we planted largely, and we can now heast of many very grand specimens, beautifully branched down to the ground of these we planted an avenue in 1863. One of the rows or one side have tolerably good shelter, whilst the other row was exposed to the east wind, yet this row—if a difference can at all be made between them—pre ents the most symmetrical and healthy appearance. This I think worth noting, as it is generally understood that the Wellingtonia will not thrive when it is exposed to flogging winds.

Of Wellingtonias I have a little more to say many years ago we planted a bank thickly with these, freely mixed with Cupressus Lawsoniana, Thniopsis, &c., with the intention of thinning out and planting in the park, this, however, was never done, and the trees were allowed to grow thickly together, so that there was practically a race for existence, the fittest only surviving. To walk in and through amongst them is something akin to walking through a very miniature natural forest. The Wellingtonias being the stronger growing have kept their heads well above all the others, whilst their naked, branchless, brown bark stems is interesting to look at as compared to the full branched, isolated specimens on the lawn. The same description, but without bronze bark, is applicable to the Lawson Cypress, which have developed into beautifully straight stems.

Our low altitude does not seem to be inimical to the well-doing of Abies Pin-apo, for of these we have a very handsome avenue, as well as many magnificent specimens on our lawns; but the gale of March 24, 1895, blew down two of our oldest and finest specimens, which were over 60 feet high.

The Cedar of Lebanon does well here, but our grandest specimens have from time to time been broken by the wind, and are now little better than

wrecks. These trees, unfortunately, are generally allowed to grow up with many rival stems, so that sooner or later they are bound to be blown to pieces; chaining the limbs together does not always ensure safety. Spruce Firs, Silver, Scotch, and Austrians, do well here; but as a complete failure, I am sorry to say, I am obliged to place the Araucaria in the same category with that of the Deodar. They were not so much injured as those at Chatsworth during the severe winter of 1860-61, where they were killed outright. Those here escaped with a partial browning of the lower branches. During the spring of 1863 I lifted a whole avenue of Araucaria, replanting them under happier circumstances; after that they did very well for a time, but the frosts which of late years wrought so much mischief amongst our Deodars, gave also, as near as possible, the roup de grace to the Arancarias; true, they are shooting out at the extreme ends of branches, but what of this, when all the rest of the tree is as brown as a berry

During the severe winter of 1894-95, when the thermometer here showed 14° below zero, a fine thirty-year-old Holly hedge, 7 feet high, was killed down to the ground, we had to cut the dead away close down; there is now two years' very good growth on it, and if we have no repetition of such low temperatures, the hedge bids fair to grow into as fine a one as before. Even hedges of the common Yew did not escape unscathed. The whole of the branches of Holly tree, measuring over a foot in diameter, were killed, the branches having to be ent off, and the naked butt is now only making a very feeble attempt to branch forth again.

Those whose good fortune has led them to live comfortably in higher altitudes, or near to the sea, are to be envied, but in the low-lying levels of the midland counties during a severe winter they are to be pitied. At King's Norton, seven miles beyond Birmingham from here, and at 600 feet altitude, I think I heard Mr. Pope say that on the same night as that on which we had 14 below zero, their glass only showed 2+ of frest. W. Miller, Counte Abbey.

CHRYSANTHEMUMS IN PARIS.

By way of continuation to our previous notes on the Paris show, we may draw attention to a few of the most interesting features from an English standpoint. There was much to see besides Chrysanthemums, but it is chiefly with these that we propose to deal. M. Ernest Calvat staged, in addition to new seedlings, a most imposing display of cut blooms in a large oval basket, tied up with broat orange-coloured silk hows, quite unlike anything we see in England. but which are familiar [but unsightly] objects in the windows of the florists' shops in Paris. The most effective flowers for the purpose were Captain Chauré, Madame Calvat, M. Hoste, M. Chenon de Leché, and Fée du Champsaur. Hairy varieties, as already mentioned, were numerous throughout the show, and in most of the groups there were varieties quite unknown to us. Popular favourites seemed to be Hairy Wonder, which was uniformly good; Louis Borhmer, Enfant des deux Mondes, William Falconer, and Chrysanthemiste Delaux. Others less well known in England were Madame Schareck, a Japanese incurved, with narrow-grooved florets, curly at the tips, very pale blush in colour, shaded yellow in the centre; MdHe. Henriette Berloz, very large for a hairy variety, also Japanese incurved in form, but having rather thin, narrow florets, colour silkyblush; Abbé Pierre Arthur, silky-bronze, a Japanese, with florets of medium width; Beaute Lyonnaise, Japanese incurved, colour dull carmine, golden in the centre; Belle des Gordes, a good flower, also of the same type, colour pale blush; Gloire Lyonnaise has very long drooping florets, and of good size, colour rosy-pink ; Souvenir de Nicolas Belisse, a very pretty terra cotta shaded golden-bronze, with gold reverse. Raphael Collin is another excellent sort as staged at the Paris show; it is of Japaneso incurved form, with florets of medium width, and is of a beautiful shade of golden-bronze, with a silky reverse. Maurice Boissard is another one unfamiliar to us; it has rather broad florets, deeply grooved and pointed. colour pure golden yellow. Frère Jovinus was striking on account of its peculiar lustre; it has narrow, grooved, incurving florets, colour golden chestnut-bronze. Dragon might best be described as a hairy Edwin Molyneux.

In the Japanese proper, Madame Carnot was nearly always good; Lord Brooke, the well-known Japanese incurved, seemed particularly amenable to French treatment, as did also Rose Wynne, W. H. Lincoln, Etoile de Lyon, Mrs. C. Harman Payne, Waban, Col. W. B. Smith, Calvat's Australian Gold, Madame Calvat, Héronne d'Orleans, a large white Japanese; Lilian B. Bird, Le Colosse Grenoblois, Good Gracious, Louise, M. Chenon de Leché, Reine d'Augleterre, W. Seward, and several other sorts well known to English cultivators, Incurved varieties of the old show type were not often seen, excepting perhaps Globe d'Or, C. H. Curtis, and C. B. Whitnall.

Messrs. Vilmorin, Andrieux & Co. were nndoubtedly the most important contributors to the show. Their exhibits almost entirely filled one large room 160 feet by 40 feet, and consisted of two large collections of cut blooms, shown on a sloping stage, covered with black velvet; and on the other side of the room a collection of cut blooms with long stems and foliage. In addition to these, Messrs. Vilmorin showed four large groups, each 45 feet in length by 6 feet in width, containing a fine lot of freely-flowered dwarf plants, about 2 feet to 2 feet 6 inches in height, all carrying good average-sized blooms. A large number of prizes were awarded to the firm for the various exhibits. In the middle of this room a very artistic group, by way of relief, was set up by M. Vonette, consisting of Palms, Araucarias, &c., edged with green moss, in the centre of which was a large trumpet-shaped vase, containing a huge bouquet of cut Chrysanthemum blooms.

First-class Certificates were awarded for the following new seedlings: to M. Ernest Calvat, for Calvat's Distinction, afterwards re-named Mellic. Lucie Faure, a capital large white Japanese incurved; Czarina, a large Japanese incurved, of a pretty shade of rosy-amaranth; Lawrence Zédé, a big solid-looking Japanese incurved, rosy-amaranth, with silvery-pink reverse: Mulame Bergier, a Japanese, with great length of floret, colour white, shaded and streaked pale pink, with yellow tips; Madamo Deis, a Japanese, colour white; Xavier Rey-Jouvin, a Japanese incurved, colour deep rosy-pink; and for Werther, also of the same type, but having broad florets, colour white, shaded amaranth reverse, silvery white, tipped yellow. First class Certificates were also awarded to M. Scalarandis, gardener to the King of Italy, for Louis Sirtori, a golden bronze-coloured Japanese : Madame Thérèse Charvet, a very pretty soft pale pink Japanese; and Piémont, a Japanese incurved, colour white, streaked pink. Similar awards were made to M. Herand, for Madame Filleul Broy; to M. Nonin, for M. Pierre Cattant; to M. Quétier, for Levendie Gentils, a pile yellow sport from Enfant des deux Mondes; and to M. de Reydellet, for Ernest. Verdet.

In the groups there were but few varieties of English origin, by far the greater number being American, Italian, and French. One variety called Fratelli Cattaneo, a Japanese of medium size, but of a beautiful shade of bright rosy-amaranth, was largely in request, and did good service in many of the groups of pot plants.

The best and most imposing collection of cut blooms from our point of view was the one staged by M. Ondot, gardener to M. Victorien Sardon. They were all big massive solid-looking exhibition flowers, rather rough in appearance, and staged in glass bottles. Had a little more attention been bestowed upon them, and the ordinary show-board used, the flowers would have made a much more effective display. Especially fine in this collection were Le Drac, Pheebus (grand), M. Robt, Whitaker (very large), Hérome d'Orleans, Calvat's Australian Gold, C. B. Whitnall, Lilian B. Bird, and J. P. Kendall. The same exhibitor also gave evidence of his skill in culture by setting up a fine collection of dwarf plants in pots. A Gold Medal and a Silver-gilt one were very properly awarded to these exhibits,

Messis, Lévêque & Son were also exhibitors of plants and cut blooms, the latter being most effectively staged in a bed on the floor; the receptacles for the blooms were covered with green moss. A display of Carnations also came from the same firm.

Chrysanthemums were shown by no fewer than fifty exhibitors, some of whom entered in several classes. Among prize-winners not mentioned in our former notes should be mentioned MM. Duval et fils, Bernard, Courbron, Deperier, Launay, &c. Cyclamens were shown by MM. Bourgoin, Jobert, and Lequin, and there were also exhibits of other flowers.

There was also a considerable display of fruit and vegetables, and also of horticultural books and serial publications.

THE ROSARY.

IN THE ROSE GARDEN.

Authorou it is only here and there that a bloom can be culled, and these far from good representatives of the variety, there is a good deal of seasonable work to be done, and the Rose-garden should be receiving as much attention as during the summer months. Unless we get severe frosts, it is often allowed us to cut a few Roses up to the end of November: but the excessive rain of late, and the frosty mornings, together spoilt our chance of doing so the present season.

A bush of Stanwell Perpetual, an old Scotch Rose and the only perpetual-flowering variety, afforded a few fragrant blooms very late in the month. Each time as the planting season comes round, we find ampteurs in doubt as to what stock is best suited for them. To a great extent this depends upon the nature of the soil, and the varieties which will be cultivated. This question of stocks is rather intricate. One cannot say that all of any one class need a certain stock; and, although the majority of Bourbons, hybrids of Bourbons and Chinese, and almost the whole of our Hybrid Perpetuals, will thrive well upon the Manetti, there is a number in each class that either absolutely refuse to do upon it, or merely linger on for a few years in an unsatisfactory condition. I would recommend that all inexperienced amateurs should leave the question of stocks to the nurserymen; at all events, till they have found a certain stock does not suit it in their soil.

In a small garden of mine, Xavier Olibo has repeatedly refused to thrive upon the Briar, but a neighbouring plant upon Manetti has grown well for the past four years. Yet the majority of growers would say it must be on the Briar stock. Early in the seventies, when the dwarf Briar was at last attaining popularity, it was claimed by some that the smooth wooded Roses of which Comtesse d'Oxford, Horaco Vernet, Louis Van Houtte, Victor Verdier, and Reynolds Hole may be mentioned as examples positively must have the Briar stock if they were to succoed. But we have, and had then, many very far from smooth-wooded varieties which needed the Briar even more. As a rule, the dwarf Briar, in the form of seedlings or rooted cuttings after the manner of Manetti, and De la Grifferaie, will be found the most trustworthy stocks for all sorts of Poses and soils.

No time should be lost in planting seedling Briars and the standard stocks obtained from the hedgerows. The latter may be trimmed much harder than is generally practised, and a lyantage only in the matter of root formation. Dwarf stocks obtained from cuttings I would still leave in the ground. A severe win'er affects the bark of these after a whole winter and summer under-ground, especially in the case of Manetti. How often we find the latter stock dead after a hard and wet winter long before the Roseworked upon it has shown serious injury from frost, and yet the wood was more exposed. Upon a light soil I like the Manetti very much for many varieties, but it is by no means so hardy a stock as our native Briar.

PLANTING OF ROSES, &c.

The more rapidly the planting of all outdoor Roses can be pushed on the better. At the present time

the wood is in excellent condition, and under general circumstances November is the best month of the twelve for planting; but if December be mild, there is no objection to planting in this month. A fairly rich soil, followed by frequent mulching, seems to give the best results. At the present time I am pruning away a considerable let of wood, that would otherwise have to be removed in the spring. This allows of more efficient ripening, and does not leave so much comparatively useless growth to protect should an exceptionally hard frost set in. All dwarfs will be earthed-up, and then slightly mulched with stable-Those carrying long growths will be manure. secured against swaying and chafing, and mostly fastened about one foot from the ground line. Should the winter require protection, this can be afforded in a short time by placing bushes and twigs among them, as in the case of more delicate and dwarfgrowing Teas. Even a light sprinkle of dry litter

After a brief review of the progress made in the production of fibres more or less familiar to Euro pean commerce, attention was directed to a floss yielded by the silk-cotton tree, known as Kapok. This has already formed an article of considerable export value in Java, and more recently it has been taken up in Ceylon and India. It is too short for textile purposes, but forms an excellent stuffing material, superior to everything except the best sorts of feathers, wool, and hair. The silk-cotton tree (Eriodendron anfractnosum) is one of the most striking features of the vegetation in some parts of the West Indies, especially in Jamaica. If the silkcotton now wasted in the latter island were carefully collected, it is probable that it would yield annually 3000 bales, of the value of several thousand pounds. In the other islands it might be worth while to plant waste places with this tree, which begins to bear in the fifth year, and without further trouble would

Fig. 131,—PINUS AYACAHUITI. ISEE P. 748.

will be an immense help under such conditions, whereas neither could be used upon an emergency when growths of from 4 to 10 feet are left in an upright position. Advantage of fine weather may be taken to slightly trim out Roses upon walls; to cutback budded standard Briars, &c. Because we do not find the same sources of delight in the rosary now as during the end of June and July, is no reason why it should be so neglected as we often find. Nor shall we get the same good results in the future as would accrue from a little seasonable work during November and December. A. Piper.

COMMERCIAL FIBRES.

Dr. D. Morris, C.M.G., Assistant Director of the Royal Gardens at Kew, delivered an interesting lecture at the London Institution, on November 30, on the subject of "Recent Researches in Commercial Fibres." The lecture was illustrated, and Dr. Morris, with his usual ability, set forth a large mass of valuable information in regard to the various classes of fibres.

yield yearly crops of an article evidently in increasing demand at fairly remunerative prices.

The recent developments in the singularly interesting fibres known as China-grass and Ramie were then touched upon. These have hitherto been regarded as at once the most attractive and elusive of fibres, and as having not only raised the greatest expectation, but also led to the most lamentable falures. The lecturer gave a sketch of their history, and stated that as the results of efforts extending over lifty years, these fibres have at last been placed within reach of manufacturers in this country, and ntilised for textile fabrics inferior only to silk. Considerable stress was laid on the fact that there were two plants concerned, viz., the China-grass (Boehmeria nivea), a native of temperate China, and the plant known in Assam as Rhea, and in the Malay Islands as Ramie (B. tenacissima), a native of the tropics only. It was useless to attempt the cultivation of the former except in moderately warm countries, while the latter required specially hot conditions. Remunerative crops could only be grown from these plants in well-drained soils of exceptional quality and fertility. A plentiful rainfall, well distributed over the year, was also necessary, as well as a high and uniform temperature. Under favourable conditions it had been shown that two or three crops of stems, weighing, in the aggregate, 15 to 20 tons per acre, could be yielded in one year, and as the plants were perennial, successive crops could be produced from rations, as in the case of the Sugar-cane. From the quantity of green stems above mentioned there would at least be yielded ribboos or raw fibre of the value (at present prices) of £8, and filasse the finished product) worth about £14. According to returns from reliable sources, the cost of the cultivation in favourable localities, on an average of years, would be at the rate of £4 per acre.

Provided there was a careful selection of suitable sites for plantations, the cultivation was regarded as likely to prove advantageous in some parts of the West Indies, especially in the warm fertile valleys of Dominica, parts of the humid parish of Portland, in Jamaica, and similar localities in Trinidad, British Guima, and the southern districts of British Honduras. Dr. Morris spoke hopefully of the future prospects of the cultivation in the West Indies, but was careful to point out the conditions essential to success; and strongly advised that only experienced and capable planters should attempt to start the inclustry, which, in their hands, might go a long way to relieve the people in the West Indies in their present difficult task of making both ends meet in the cultivation of the Sugar cane, "Colonies and India," December 5.

FLORISTS' FLOWERS.

AMONGST FLORISTS' FLOWERS IN DECEMBER.

A quier walk round the garden shows us that even in this dull month something can still be done, and there is something to interest the cultivator, be he amateur or otherwise. The Auricula is one of our choicest favourites, and I happened to visit two gardens this week where large and choice collections are grown. In one, the decayed leaves were lying thickly on the surface of the soil attached to the plants; in the other, all dead and decaying leaves had been carefully removed, and the Auriculas were neat and presentable, the plants in their white and cream-coloured foliage being very pretty. There are no flowers known to me which present so many differences in the foliage as Auriculas, and an expert can easily tell the names of most of the varieties from their foliage alone; and one cannot greatly admire their December beauty if the dead and decrying leaves are not removed. This should be attended to periodically, say, once in three or four weeks during the winter; and a word of caution here is necessary, for in the removal of decaying leaves much mischi f may be done. If they are removed before they are sufficiently decayed, the main stem of the plant may be injured; on the other hand, rotten decayed leaves will also engender decay. Although the autumn has been wet, and the weather is now not at all favourable, we have had no losses amongst our plants. What is required is free ventilation, so that the foliage be kept dry. Moderate dryness at the roots is another point to be observed; the plants may not need water oftener than twice in a month, and then not during severe frost. Of course, I am writing under the assumption that the plants are in cold from is.

Small seedlings want looking to frequently, and precautions taken against injury by slugs; also to remove the tiny onter leaves as they decay. Trusses in their incipient stage should now be showing in the axils of the leaves of some varieties; indeed, if they do not show now in such varieties as George Lightbody, Mabel, Richard Headley, &c., the best surt of flowers will not be produce l. The trusses gradually develop during the winter, but the corollas will not open until the middle of April; the exhibitor soon learns to value and care for these early winter developments. It is better to put the seed-pans into a house from which frost is excluded, as the seedlings continue to appear all through the winter and spring months. Next in importance to the Auricula are the

CARNATIONS AND PICOTEES.

These truly beautiful and sweet flowers have been very greatly improved during the last few years. An old florist called upon me the other day, and as I talked to him about the heauties of many self and fancy Carnations, he reminded me that in our early years the selfs and fancy varieties were thought nothing of by the florists; their great aim being to produce handsome, well-formed, well-marked bizarres and flakes in Carnations, or well-marked Picotees in their various colours. This, as we know very well, is quite true; but where there were ten growers of Carnations in the old days, there are now ten hundred, perhaps, and amateurs in these days do not care to be bound by the rules of the fanciers. Carnations are sufficiently hardy to withstand the severest frosts of our British winters: but I have always recommended growing a few plants of each variety in flower-pots, and preserving them in cold frames during winter. Even when it is not intended to flower any plants in pots, it is well to take this precaution, so that there may be a reserve wherewith to fill up any gaps which may occur during our uncertain winters. Exhibitors who wish to compete for prizes at flower-shows must cultivate the greater number of their plants in pots; and of course these were all potted up before the end of October, so that they might be well established before severe frosts set in; and here, as we carefully examine the plants in the frames of two different cultivators, we find in one the plants clean and healthy, all dead and decaying leaves removed, no weeds left in the soil, and the surface loosened where greenmould had begun to grow. Green fly had also been destroyed, for notwithstanding all the diseases we read about, this pest, if not excluded, does more mischief than any other. Let us examine the other collection, and point out to the owner as we walk along the work requiring to be done. Most of us know his answer. It is want of time; but he means to have them all put right some day. The fact is, his work is all done by fits and starts, hurried over, and not with the careful touch of the true florist. Like the Anricula, the Carnation-frames require plenty of ventilation, the glass-lights to be drawn quite off in fine weather, and there is no need to be a'armed if the soil in the pots is frozen quite hard. The leaves of the Carnation show no appreciable injury from severe frosts, but the outer loaves of the Auricula plants do suffer at least, many of them decay after the frost disappears, from its effects; but this does not touch in the least the vitality of the plants. I may add that green-fly will live both on Auricula and Carnation plants during severe fros's, and the pest can only be removed by fumigating or dipping the plants in soft-soapy or tobacco-water: but this treatment does not suit Auriculas, and altogether I think it best to fumigate. The Carnstion plants must not be allowed to become dust-dry at the roots, and in this respect they suffer more than Auriculas.

In the open borders the Carnations are supposed to take eare of themselves; but it is necessary to look to them, to see that they are not loosened and thrown out by frosts—it is best to look over the plants, and press them into the ground after frosts. Keep the ground clear of weeds, watch for slugs and the leather-coated grub; and where sparrows are plentiful they do much damage to the leaves. They can be kept off by straining cotton-threads over the plants; this seems to deter them, as they do not care to go under the threads, but frequently they will peck the plants if the threads do not reach quite to the outsides of the beds. J. Douglas.

NOTICES OF BOOKS.

VEGETABLE CULTURE.*

This is another of those small manuals, the issue of which has been frequent during the last few years, which seem to be called for by the increased atten-

tion now being paid to la petite culture. It is written by Mr. Alexander Dean, a very old correspondent of this journal, who has made the cultivation of vegetables as well as that of hardy fruits a life-long study. Needless to say, it is replete with valuable information upon vegetable culture, conveyed in simple language. It is illustrated by numerous woodcuts, and arranged under convenient headings. The writer begins at the beginning by affording excellent directions for draining, manuring, trenching, and digging soils, contrasting good with bad methods. We fail, however, to note any allusion to that boon to cottagers, the dry earth-closet system, with its excellent sanitary conditions, and its valuable results in the form of an odourless manure of great efficacy in the kitchen garden. The value of lime in Potato culture is remarked upon, but we find no notice of superphosphate of lime in this connection; and yet it was patent from the Dalmeny experiments, allusion to which was made in a recent issue, that the weight of erop was greatly increased by its use. A telling illustration is given of protective and non protective earthing-up, which should render intelligible to a person of ordinary capacity the advantages of the former over the latter in the protection of the tubers against disease. The list of varieties of the Potato is a select one of moderate length, and it might be still further reduced by the excision of merely show varieties. The list of Peas needs the same kind of pruning as regards the very tall-growing varieties, which no one will contend are suited for cottagers or

THE FLORA OF BRITISH INDIA. By Sir J. D. Hooker, K.C.S.I., &c. (Reeve & Co.)

The twenty second part now issued completes with the exception of the index) a book which can only be compared, in its scope and completeness, to the Flora of Australia, though the Indian Flora is of necessity much more complex and varied. Both works have mainly been wrought out at Kew. The Australian work, propared by Mr. Bentham, could not have been satisfactorily completed but for the constant co operation of the late Sir Ferdinand von Mueller. The monumental work before us is due to the energy, activity, and clear perception of Sir Joseph Hooker. The first part was published in May, 1872, so that a quarter of a century at the least has been devoted to the elaboration of this great work. Seventeen years previously to the issue of the first part of the Flora, a fragment by Sir Joseph, in co-operation with the late Dr. Thomson, was published, which bid fair to be the finest and fullest exponent of the classificatory and morphological science of the day. It was conceived on too vast a plan, and even the indefatigable energy and zeal of Sir Joseph Hooker were not adequate to its completion on such a scale. When Sir Joseph first began the preparation of the present work, he was Director of the Royal Gardens, Kew, remained so for many years afterwards, fulfilling at the same time many other public and official duties. That in spite of so much interruption, Sir Joseph should have been able to complete his gigantic labour is a matter for as much gratification as astonishment. During the last few years the work has been carried on at the same time that a general, and by no means perfunctory, superintendence has been maintained over the preparation of the Index Kewensis. In the earlier volumes Sir Joseph had the assistance of numerous contributors, who relieved him of some of the details; and again in later years the assistance of Mr. C. B. Clarke, of Dr. Stapf, and others, has materially served to expedite the progress of the work, and to add to its value. Nevertheless, from beginning to end, the editing of the whole book has fallen to Sir Joseph, who, moreover, is responsible for the larger portion of its contents, including in these later days the Orchids and the Grasses! Botanical readers will appreciate the significance of that note of exclamation. The later volumes are more fully elaborated than the earlier ones, and among the grasses from ahalf to a quarter of a page is often taken up with synooyms alene. The Bambuseæ are taken from Mr. Gamble's Monograph of Indian Bambuseæ; and some notes are added from Mr. Freeman Mitford's observations.

ICONES ORCHIDEARUM AUSTRO-AFRICANARUM. Vol. I., Part II.

No better work of its kind has been undertaken by botanists in recent times than that which has been sent forth by the talented and painstaking author of the work under notice. In 1888, his Orchids of the Cape Peninsula appeared, in which many species of much beauty were described and illustrated, a work that was received with delight by everyone who was interested in the subject. Then followed Part I, of Icones Orchidearum Austro-Africanarum, or Figures with desceriptions of extra-tropical South African Orchids; the continuation of which, in Part II., we now receive, which appears to be even more earefully prepared and worked out than its predecessor. It contains fifty partly-coloured plates, prepared from very accurate drawings made by the author, whose work at every point bears evidence of his intimate knowledge of the structural details of subjects so little known to any but himself, and who has had the great advantage of studying many of them in their native habitats. Among those illustrated and described are eleven species of Disa, most of them of purely botanical interest, although some of them are well worthy of cultivation, and notably the blue Disa purpurascens, soveral specimens of which have flowered in England; the white D. schizodioides, the small red-coloured D. sanguinea, and the pink D. nervosa. Satyrium spherocarpum, S. longicauda, and others among the species of Disperis, Habenaria, Angræcum, Mystacidium, Pterygodium, and Brachycorythis, are pretty enough for garden plants, if they could be induced to grow in a satisfactory manner; while all from their very remarkable structure are interesting in the bighest degree to the student and the botanist. Of Eulophia, Pachites, Zeuxine, and Schizodium, a single species of each only given, the last-named being a most singular species with insectlike flowers. In his remarks, Mr. Bolus has something of interest to tell about most of the subjects. Especially interesting are the illustrations of his Pterygodium Newdigatæ, and its singular variety P. N. cleistoganum. We are pleased to welcome this new publication, and wish Mr. Bolus every success in his very useful if laborious task.

DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES.

A second instalment of the beautiful illustrations of Orchids, male by M. A. Goossens, and descriptions by M. A. Cogniaux, the talented director and editor of the work, is just to hand, and proves equally faithful, useful, and interesting, as those which have previously been received. The present issue comes in portfolio, labelled Cattleya, and some of the contents relate to that genus, of which C. Warscewiczii, C. Victoria Regina, and C. Hardyana, are admirably rendered. The preambles of the genera Dendrobium, Cypripedium, Selenipedium, and Lælio-Cattleya, are also furnished, and several very good examples of each, forming a commencement for their respective portfolios, are given. Of the Dendrobiums, D. nobile, D. n. Cooksonianum, D. × Ainsworthi, and D. x Cassiope, are illustrated and described; of the Cypripediums, C. Stonei, and Sclenipedium × Sedeni; the Ladio-Cattleyas being represented by L.-C. Nysa and L.-C. × Proserpine.

We remark that the sign of hybridity (\times), which is so useful at a glance to determine which are acknowledged species, and which are hybrids, is omitted; and as in many cases it forms part of the original description quoted or referred to, its omission seems to form an unnecessary departure from a very general practice.

[&]quot;It is published by Messes. Macmillan & Co., at the price of 13.

^{**} Icones Orchidearum Austro-Africanacum retra tropicarum, or Figures with descriptions of extra tropical South African Orchids. By Harry Bolus, F.L.S. (London: William Wesley & Son, Strand: 1898).

PRUNING SHRUBS.

THERE are two or three elementary rules which are to be observed when the production of flowers is primarily desired. Shrubs which blossom early in the spring form their flower-buds the year before, and ingeniously protect them during the winter with a warm covering, so that they are ready to open with the early days of spring sunshine. Anyone who will cut off the twig of a Peach-tree in the winter, or of an early-flowering Spiraea, and put it in water, will understand this, for the flowers will expand in a few days after it has been brought into a warm room. Obviously, if the branches of such shrubs are cut hard back in autumn, all the flower-bads are cut away, and there is no bloom in the spring. If, however, the branches are cut back immediately after the flowering season is over, this will encourage the growth of new shoots from bulls near the base of the branch, and these will grow rapidly to take the place of the part that has been lost, and cover themselves with flower-buds for another year. Another class of shrubs, like the Hydrangeas, Altheas, and certain Tamarisks, which flower in late summer or autumn

Fig. 132.—Shoot and cones of cines very charite (see e. 74s.)

from buds which have developed on the wood grown during the current summer, should be pruned in late autumn after flowering, or, at least, before the wood starts in the spring, so as to encourage abundant summer growth, and flower-buds for the next autumn. But these are the simplest elementary rules, and relate solely to the production of flowers. Shrubs are useful for many other purposes than merely to display their blossoms. They are beautiful all the year round. Even in the winter the variously coloured barks of many of them add a singular charm to the landscape. We therefore prune them not only to promote the production of flowers, but of wood, and foliage, and fruit as well, to ensure grace or symmetry of outline, and to make them vigorous aud healthy.

The simple cutting in of flowering wood in spring or fall is thus a small part of the art of pruning, and where there is a large variety of shrubs there is no time of year when something in this direction cannot be done, and it is especially useful when it is continued throughout the entire growing season. If surplus wood is to be removed, a clean cut in mid surmmer will heal over much more readily than it will in cold weather, and there is no better time for removing superfluons branches, or for shortening-in over-vigorous shoots which interfere with the sym-

metry of a specimen. Some trees and shrubs whose branches bleed when cut in spring will heal over quickly if pruned while in full leaf. If the strong branches are pinehed back in summer, the wood will ripen into such a sound condition for withstanding cold that trees naturally tender have been known to endure our winters fairly well when their branches had been properly stopped. This summer pinching is especially useful in wet seasons, when otherwise the wood keeps growing late in autumn, and is caught by freezing weather in a soft and sappy condition. It also discourages upward growth where this is undesicable, and tends to develop fruit-buds, so that shrubs and trees will bear fruit at an earlier age when they are properly pinched back. For the same reason shrubs will ripen their fruit more perfectly when the stronger shoots above it have been stopped.

Just how much to cut is a matter to be learned by experience. Sometimes the best way to renovate a shrubbery is to cut many of the plants to the ground and let them start anew. In others a very severe pruning is often advisable. If every annual shoot of the large-panieled Hydrangea is cut back in autumu or early spring to a couple of eyes, the growth next year will be very vigorous, and even after the new shoots start, if all the weaker ones are rubbed out, enough will remain, each one carrying an immensu flower head at its extremity, to completely cover the shrub with bloom. But it should not be forgotten that too much pruning weakens plants. When florists began to sell long-stemmed Roses they soon discovered that they were selling the vitality of the plant as well as the flowers, and they learned to give a long period of rest to the weakened plants which were to produce another crop, so that they might recuperate their exhausted energies. Every one has observed how abundantly the foliage starts out from the stump of an amputated branch of a Silver Maple, for example, but this is not a proof of increa ed vigour. In reality it is a signal of distress, and shows that the tree has aroused itself to an extra effort to supply the places of the organs of nutrition of which it had been robbed. A young plant carefully pruned when it is set out in good ground, with room enough to grow in, will sometimes need, as it grows, to have interior branches cut away for the admission of light and air, and the over-strong shoots punched back in midsummer, and dead wood carefully removed. Little more will be required, as a rule, except to shorten in judiciously the flowering wood after bloom, and under this treatment shrubs will develop into their best form, and flower abundantly year after year. Garden and Forest.

METHODS OF PROPAGATION BY MEANS OF LEAVES.

(tentenued from p.~687)

Some plants are easily propagated from leaves. I remember being in a café opposite to the Botanical Gardens at Brussels with one of the staff, and seeing a leaf suspended from the ceiling by a thread looped so that it should hang suspended in a plane with the horizon; on closely examining it, I found it a leaf of a member of the numerous House-Leek (Sempervivum) family, Bryophyllum calycinum, which, when suspended in the mauner indicated, soon produces minute plants at the angles of the crenulations. These throw down minute roots, and eventually develop leaves on the upper surface. By cutting up the leaf therefore, each one of these will develop into a plant. This fact was noted and hinted to me, that plants of a like nature, viz., so called succulents. could all thus be increased simply by using their mature leaves.

Now, Echeverias, Sempervivums, and plants of a like nature, being required in their thousands for use in the neat but monotonous systems of carpet bedding, any rapid means of increasing them must of necessity be welcome. First, take care to use old plants, and pull, not cut, off their leaves, which will be more easy after the plants have been allowed to get dry in their pots. Lay the leaves aside in the shade for a day or two, and then proceed to prepare some propagating

pans or trays, by first putting in a good layer of drainage consisting either of finely-broken crocks or well-washed gravel. On this place some sandy loam, or light mixed soil, finishing up to the edge of the pan or tray with fine sand. Water well with a fue rose-pot to consolidate the soil, and when all superfinous moisture has drained off, begin to dibble in the leaves by the heel, as I call the lower part which attached it to the parent plant. Take great care not to bruise the soft leaves, either at base or top, or they will rot and destroy the whole batch; and continue to dibble in till the tray or pan is full. Give all a good shake as soon as finished, to fix the soil around the leaves close and firm, and then put the trays on a warm and dry shelf.

This operation may be begun as soon as the days begin to lengthen, and if done at this period, in a mouth or six weeks little plants will appear at the bases of the succellent leaves, when a little sprinkling of water may be given, but not much. In a mouth the minute plants are large enough to prick off into store boxes or pans, in which they may be allowed to grow till wanted for bedding. The denuded stems of

 $\Gamma_{1,3}=13~\rm{m},-\rm{manner}$, of the feologication of plants by means of leaves.

the plants being put aside on a dry shelf will soon develop many little plants at the point where the leaves have been removed (fig. 133), and may be utilised to still further increase stock. The time for this depends greatly upon what plants you have to assoeiate with them, ranging from the middle of June to the first week in July in the north, but a little earlier in the south and west. If, however, the groundwork of the contemplited beds is Alternanthera in variety, this period will be found quite early enough for safety; for I have known Alternanthera browned and spoilt by frost as late as June 24. This plan of leaf-propagation, as I call it, is applicable to all species of succulent plants, such as Echeverias, Sempervivums, Kleinia, Pachyphytum, Leucophyton, as well as the more noble flame-flowered Rochea falcata. Other plants, far removed from these, are also propagated from their leaves, and I scarcely think I should be romancing if I were to assert that all thick leathery leaves will at some period or other of their growth, notably when they attuin to their proper period of complete growth, are capable of producing young plants of their kind, favourable treatment and circumstances being secured,

GLOXINIAS.

For instance, the leaf of the Gloxinia may be laid upon the surface of the soil, a splint of deal placed upon it at the base and another at the apex, and these kept down by Verbena pins, so that all parts of the leaf are in close contact with the soil; or the leaf may be divided into three or more pieces, by a sharp knife, and these cut portions bedded into the soil in a tray edgeways, or pan prepared as directed for Echeveria, and then plunged in a warm but not too humid pit in cocoa-nut fibre refuse or warm tanner's bark, when a number of little pea-like tubers will form at the edge of the crenations, and at the angles of the crossing venation, which will in time develop into small plants. These being cut carefully away from the remainder of the leaf, and potted singly into thumbs, or pricked out into pans or propagating-trays, will furnish good useful plants. F . p. rience.

(To be continued.)

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By JNO. McIntyre, Gardener, Woodside, Darlington.

Now that, late in December, the propagation of stove plants has almost ceased for the year, the opportunity is afforded the gardener to increase his stocks of some of the more useful plants that are employed in quantity for forming groups, and for the decoration of apartments. Foremost among these is Anthurium Andreanum, an effective species, which is easily increased if proper means are taken. At Woodside some dozens are grown. Those plants that were raised last year will probably have become lauky and thrown serial roots, similar to those of the Yanda; therefore, to lower them, it is necessary to merely take off the tops and place them singly in 13 inch pots in a compost of sphagnum-moss and fibrous peat, and put them in the propagating case till established, when they may be taken to the stove. A period of three or four weeks in the propagatingcase will suffice. The stools from which the tops have been taken should be placed in the warmest house or pit the gardener has, to "break," and usually they will throw two or three shoots, which will serve for increase if detached and inserted similarly to the tops of the plants, say, in the months of March or April. They make nice small plants, which usually carry spathes the same year. Anthurium Scher-zeriauum in the full specimen form is an excellent plant for the exhibitor and for furnishing spathes for indoor use, but it is not of so rapid growth as A. Andreanum. The aged plants should now be examined, and if a number of medium sized plants is required for filling vises, &c., and for such use it is a very suitable plant, the spathes lasting in good con-dition for three or four months, and a specimen plant can be spared, it may be simply split up into single crowns, each of which if placed singly in 41-inch pots, in a compost consisting of two parts good peat, one of charcoal, and one of sphagnum-moss, and placed in the propagating case till established, will make nice plants. After establishment, move them, like the first-named species, to a moist stove to make their growth. The present is a good time to afford exhibition specimens of these plants are potting, and to put them morder for another year. In respotting specimens it is well to keep the crowns raised above the rim of pot, packing the materials up around them in the manner adopted with some Orchids.

Chry arthogram, The flowering season being now over, the places occupied by these plants must be filled with others. Arrleas, if they were given a warm house last mouth, will now be opening their flowers, and may be substituted for the Chrysintheniums. Spirasas should be pushed on with heat, and supplied abundantly with water at the roots. Azalea mollis in quantity may also be placed in the forcing-house, and the imported plants afford good returns in cut flowers if well managed. After being started into growth in a warm-pit, they should be removed to an intermediate-house to open their flowers, knoping them there till they are fully in flowers. The flowers of this variety list but a short time when cut, and in that respect they are disappointing, unless the plants have stood for some days in a coal house. The same holds good to a certain stept with the plants

Cincrarias.— The earliest batch is now coming into flower. As is generally well known, the Cineraria will not bear forcing; and if early bloom is required, seed has to be sown early, and the plants allowed a proper amount of time to grow. Here there is a fine lot of healthy plants in 5 and 6-inch pots just showing for flower in a cool Peach-house from which the frost is merely excluded; they were raised from seeds sown at the cull of March. Pefore they are removed into the conservatory they will receive several fumigations with tobacco.

THE ORCHID HOUSES.

By W. H. WHITE, Burford, Dorking.

Epidendrums.—Epidendrum Endresii is a lovely Orchid of small growth, and those who possess it may be assured that it is a species worthy of their best attention. It is not however possible to grow it satisfactorily with the same kind of treatment meted out to most of the Epidendrums, for although of small growth, it dislikes to be suspended near to the roof-glass, and prefers a rather damp, shady corner of the house. Red-spider forms its chief foe, and in spite of a plant being kept always in a damp position, these acari will infest the undersides of the foliage, and if they are not quickly cleaned off with a sponge, it will soon change colour and fall off; and the leaves gone, the plant rarely recovers. E. Endresii should be well supplied at all times with water at the root, and a little more than usual is beneficial when the flower-spikes are showing: these are produced on the apex of the newly-made growth. After flowering, growth soon recommences, when, if necessary, the plant may be repotted, the rooting-material need consisting chiefly of sphagnum-moss, with a few pieces of fibry peat, and the drainage should be perfect.

Epiphronites—Vertchii, now sending out its pretty spikes of flowers, requires identical treatment with Epidendrum Endresii. It is a plant which grows very freely, often producing young plants from the old flower-stems; and such small pieces, as soon as they begin to put forth roots, may be removed with a portion of the stem attached, and potted in the smallest possible pots, using sphagnum-moss only; and in a very short space of time the pots will be found filled with roots, at which time reporting should be performed. The better-known Epidendrum Endresio-Wallisii a, and the charming E. elegantulum, a hybrid between E. Wallisii and E. Endresio-Wallisii, are plants which thrive when accorded the same kind of treatment as E. Endresii.

Odontoplosaum Wiresewie, ii, now better known under the name Miltonia Endresii, is the rarest of the genus, and it is one that should be kept continually in the intermediate house, and in a cool and very shady part of it. At the present time there are at Eurford some plants that are now sending up their flower-spikes, which must be closely watched for small yellow thrips, which quickly destroy the inflorescence.

Miltonia Schroderiana. Plants of this distinct and handsome species are starting to grow, and any reporting useded had better be seen to forthwith. A compost of one-third fibrous peat, and two-thirds sphagnum-moss, with plenty of small crocks intermixed, suits it. During growth it should be kept slightly warmer than ordinary, although on the completion of growth an intermediate house is the less place for the plant.

Cattleya house.—Those plants of the pretty Vanda Kimballiana which have passed out of flower, should be kept drier at the root, and as a guide to the state of the compost in this respect, if the surface moss becomes white and crisp, no heavy application of water is needed, but only a slight sprinkling with a fine rose watering can. Its congener, V. Amesana, in bloom at the present time, it it be kept without water at the root, the flowers, which are very fragrant, will last for several weeks in good condition. It should be placed in a light and dry position.

Intermediate house. - Epidendrum inversum and E. cochleatum, now flowering in this house, are interesting and curious plants. E. Frederici Guilielmi is a fine showy species, which should be more commonly found in collections. The young growths have made considerable progress, and fleshy roots are pushing out from their Lase. This is a critical time for the plant, for if much water be afforded before the roots have taken a firm grip of the compost, they soon turn black at the points, with the result that the growths make no further progress.

General Work.—Advantage should be taken during mild weather to clean the houses inside and out, so that light may be freely admitted to the plants. At the same time the plants should be carefully examined for insect-pests, and the foliage cleaned with warm rain-water; also wash pots, stages, &c., and white-wash the walls.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

The Early Vinery .-- The Vines which were started at the beginning of the month of November, having now their buds in a forward state, should have the warmth of the vinery slightly increased, not, however, exceeding 60° to 65° by day by artificial means, so long as the leaves are not put forth. If a bed of fermenting materials is not in use, the inner border may be copiously afforded water at a temperature of 90°, for although root-growth will not have become active, the degree of warmth thus imparted by the water will hasten root action and thereby the production of foliage. For old Vines the use of warm liquid-manure is more advantageous as a stimulus than clear water. Attend to the often turning and renewing of the hot beds at present in use in the vineries, tho warmth and moisture arising from these being of great service at this stage; economising fire-heat, and lessening the need for frequent syringing. Young Vines which have not been previously forced early should have the rods laid horizontally till they break regularly their entire length.

Pot Vines.—If the earliest crop of Grapes is taken from Vines in pots, and these are surrounded with fermenting materials, great care is needed in guarding against any excess of heat in the dung-bed, at the same time additions of new well-propared leaves and stable-litter must be made from time to time, as the heat is found to be declining. It may not exceed 70° to 75°. As the Vines break into leaf, raise the warmth of the air by degrees to 60° for night, 70° to 75° by day—the latter by sun-heat. Admit a small quantity of air from outside by opening the upper ventilators when the inside thermometer indicates 70°. Disbudding may be commenced as soon as it is possible to discern the bunches, and carried out gradually, reserving the finest bunches for a crop. The laterals ought to be stopped at the second joint beyond a bunch. Those who use evaporating-troughs (many gardeners do not like them) may now fill them will liquid-manure or weak guane-water, and sprinkle the floors, &c. with the same at closing-time.

Young Pot Vines. — If these are to be grown into fruiting size for the purpose of being forced next year, the canes should now be ent-back to two buds, and the cuts dressed with styptic or knotting. They may be started early next month. Vine-eyes may now be prepared for striking in hot-beds, inserting them in small pots filled with turfy loam made very firm, with the bud level with the soil. Preparatory to placing them in a hot-bed, place in a cool house or pit for a few weeks.

Stream of us in Pots.—With the appearance of the bloom-trisses on the plants, the temperature by day should be advanced a few degrees, though it will be well to be guided by the weather, not attempting to push them on much when it is cold and dull. Examine every plant once a day, affording water to those requiring it; syringe them all lightly in fine weather, and sufficiently carly for the foliage to get dry before nightfall. Keep a sharp outlook for aphis, funigating thoroughly on two successive evenings if any be noticed. A night temperature of 50° to 55° should as yet not be exceeded, and in frosty weather it may fall to 45°. Guard against a muggy atmosphere by having a small amount of air admitted at the top of the house. A batch of plants to succeed these may be got under cover, cleaned, and top-dressed, and brought into, say, an early Peachhouse during the next week. Plants in the open should be protected in frosty weather with a light covering of Feru or bast-mats.

THE FLOWER GARDEN.

By Hedley Warnen, Gardener, Aston Clinton, Tring.

General Remarks.—The bed occupied by Iberis, Walldowers, Alyssum saxatile, Polyanthus, Saxifraga, Pelemonium, Anbrietia, Honesty, small shrubs, and the like, should have the beaten soil lightly stirred on drying days. Those beds which are occupied by bulbs and plants should be similarly stirred with a fork or rake, and never with a hose otherwise durage may be done to them. With regard to these

heds, it is always advisable to afford a mulch when the planting of the bulbs is finished, using cocoannt fibre refuse, or sifted leaf-soil, in which case the stirring of the soil is unnecessary.

Winter Avonites and Daffodils are already making their appearance on established plants, and care must be taken not to injure them when stirring the surface. The former makes an excellent carpet-flower, where, under deciduous grasses and other plants it cannot be made to grow satisfactorily. The Tenby Daffodil is excellent for planting in clumps in similar places on a lawn or in a shrubbery; and where these are planted in places sheltered from the north or east, flowers will appear some weeks earlier than in exposed positions, thus prolonging the Daffodil season.

Iry Edgings.—Ivy makes suitable edgings and verges where turf will not grow, or has to be removed every year; and Irish lvy is a very suitable variety, it being of quick growth and pleasing aspect. The most suitable season for planting Ivy is the present. In doing this, spread out the shoots and peg them down to the earth so that they may be able soon to push the roots into it, and grow and make a thick carpet of foliage.

Skimmia japonica is an attractive berried-section which is not grown so extensively as one might expect. It thrives in smoky towns, and although it delights in a fairly moist soil, and a partially shaded position, yet, if water be stagnant in the soil, the plant will give no satisfaction. Skinuma Fortunei and S. japonica oblata) are useful as window-plants, and readily increased by seeds or cuttings, but being of a somewhat slow growth, it is advisable at the first to purchase fair sized plants from a nursery, making sure that you get a few males among the females, Skimmias being dioccious.

Garrya clliptica, a beautiful evergreen shrub, is useful alike when planted in the shrubbery, in an isolated position on the lawn, or against a wall. As a bush it should not be restrained, but allowed to grow naturally, it being then seen to the greatest advantage. It bears pruning with impunity, if this be called for by its position in the garden, quickly refurnishing itself with new growth.

Hardy Fuchsias.—The old Scotch variety, Riccartoni, and the species F. gracilis, make excellent groups on the lawn, or in conspicuous places in the shrubbery borders, affording a good display of bloom in summer and early antumn, and they are very effective when used in combination with variegated Maize or the Enlalius. Established plants of either may be hard-praned when the foliage has fallen, the stools being well mulched with half-rotted manure, as a protection against frost, and an aid to growth. The plants are raised by striking the tops of the soft or half ripened shoots; the former is preferable—in sandy soil, in a slight hot-bed, during the spring or in early summer. Where a large quantity is required, a good plan of getting plenty of shoots is to place an old root or two in a house that is slightly beautiful.

THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

The Raspberry Quarters.—The staking and securing the canes should not be longer delayed. In the first place, cut away every old cane which bore fruit last season, and lay in their place four to six of the strongest and best ripened canes of the current year's growth from each stool; the others being cut away close to the base. If trellis be used, fasten the canes at an equal distance from each other, and if these are bent over and secured to a stake, placed midway between the stools-the canes should be twisted slightly round each other so as to form a strong bow, and fastened to the stake at from 21 to 31 feet from the ground; or they may be laid against the stake and kept in position by a couple of ties, one near the top, and the other half-way down it. In this case the and the other half-way down it. In this case the canes are shortened to within 6 inches of the top of the stake or trellis, which are generally about 5 feet high. All usable suckers growing in the alleys should be grabbed out, also large weeds: then afford the plantation a dressing of fresh lime, and spread a mulching of rich manure 2 inches in thickness over the whole. Raspberries are not liable to many insect pests; but at the least there are two which commit a great deal of injury to the plants if means are not taken to rid the latter of them. The Raspberry mite (Phytoptus rubi) feeds on the immature buds causing them to become abnormally large, and incapable of expanding in the spring. The mite is readily discerned if the buds are examined occasionally during the winter, especially the lower buds, these being the first to be attacked. Every infested bud should be removed and thrown into the fire. The Raspberry-beetle (Byturus tomentosus) feeds on the pollen and stainers, and thus prevents the fertilisation of the flowers. The larvae hide under the loose bark of the canes, and where untrimmed wooden stakes are in use under the bark of these as well; also in cracks and crevices in the stakes. In such places it changes to the pupa stage, and the beetle emerges in the following spring. These remarks show how very necessary it is to be careful in collecting every bit of old Raspberry-cane, and burning it forthwith. The bark should be removed from the stakes used, and all that have cracks should be made into a bonfire, and thus numerous insects will be got rid of. Raspberries for fruiting in the autumn should not be cut down at this season, but left till February, when all the canes must be cut away at the lottom.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead.

French Beans, -Those plants which now are coming into flower should be afforded a temperature of 60 to 65°, and not much moisture in the air. The present is the worst time of the whole year for the setting of French Beans, and more especially in localities much visited by fog, involving great cure on the part of the cultivator. The paths, walls, &c., may be damped once or twice daily in order to counteract the dryness that is due to the use of artificial heat, but overhead syringing will not be required for the present. A sowing may always be made for suc-cession when the plants from the last sowing show for blossom, using 8-inch pots, which is a convenient size for placing on the shelves and ledges usually found in Pine and Cucumber pits and houses. Good varieties for present sowing are Syon House and Ne Plus Ultra. In preparing the pots place a large hollow crock over the hole, and on this some rough sifting of loam, dung, or leaf-mould, and on these sufficient rich loamy soil to reach threequarters of the depth of the pot, make moderately firm, and sow seven or eight seeds equi-distant from each other near the sides of the pots, cover with I inch of soil, which should not be pressed, but merely shaken level, this will leave plenty of space for holding water, and a top-dressing of a light kind if this be thought necessary. Some gardenors do not mould up these early sowings, believing that it causes the decay of the stem-

Mushrooms.—Continue to prepare short stable-dung for forming new beds. If a good-sized bed be made up every three weeks or a month, the Mushroom supply will be well maint fined, Assuming that a crop of Mushrooms was obtained from the earliest autumn bed, and its removal, owing to its still producing Mushrooms, is not yet desirable, the surface, if dry, mry be afforded a moderate quantity of warm water, into which salt, at the rate of one handful to every three gallons, is dissolved; then, if the spawn be not quite exhausted, a second crop of the esculent may be obtained. Non-success in Mushroom culture may with truth be sometimes attributed to the unsuitableness of the places in which it is attempted. The air in a Mushroom-cellar or shed should be moist and genial, never harsh and dry; the beds, before they have borne a crop, should rarely need to be afforded water to wet the soil, but the conditions should be such as to prevent to a very great extent the evaporation of moisture from the beds. Our Mushroom-house is provided with a flow and return pipe located in a drain under the floor, whence they pass to a house beyond; sufficient warmth being obtained from the beds by covering the roof and walls with bracken to the depth of 1 foot. By these methods we secure an even temperature day and night of about 55, and only in very cold weather do we find it necessary to make use of the hot-water pipes. But little syringing or watering of the beds is required in houses of this description.

Radishes.—If early Radishes are required, a ted of fermenting material should be made up, consisting of equal parts of tree-leaves and stable litter, and when finished, a frame of one, two, or three lights placed on it. If the hot-bed be 2 feet in depth it will suffice for gatting a crop of Radishes. Like hot-beds for other uses, it should be made firm, and the longer strawy parts kept at the sides, so as to prevent the leaves from falling out, as they will when this is not done. Fill the frame with the more leafy parts of the materials to within 10 mehrs of the glass, and afford gill on this to the depth of 4 inches. When, in the

course of a few days, it has become warmed, press it evenly and firmly, and broadcast the seeds thinly, pressing them into or merely covering them with earth. The varieties, French Breakfast and Earliest Frame Radishes, being quick growers, should be chosen for frame-work.

Carrots.—Similarly a bed for early Carrots may be made up, making it 1 foot higher, Carrots being of slower growth than Radishes. Soil it to the depth of 6 inches, sifted sandy loam and leaf-mould. The seeds may be sown broadcast or in lines, and kept in darkness till germination has taken place. The variety, Parisian Foreing, can be recommended for very early sowing.

Tonatos.—If fruits tit for use in April are expected, seed may now be sown, and thin sowing is of very great importance, whether in pots or boxes. The young plants, until they are potted off, should always stand clear of each other. If the seed-pots or pans can be plunged in a hot-bed, germination will take place after the lapse of a few days, when the pots, &c., should be taken out and stood in a light position in a house or pit, with a temperature of 60° to 65°. Pot off the seedlings into 3-inch pots as soon as large enough to handle conveniently, and continue to grow them in the same degree of warmth, keeping them near to the glass.

THE APIARY.

By Explet.

Numbering Hires .- Since writing about this a short time since a fresh method has arisen, and seems to me to be a good one. The old plan of numbering is certainly not as good as this, because, as the hives require painting, the old number in time is not dis-tinct enough to be seen; and besides this, if you wish to remove a hive from one place to another, the numbers must get mixed up. The new plan is as numbers unst get mixed up. The new plan is as follows: Get some old zine oxidised by exposure; cut this up into small tablets, about 6 by 4 or 5 by 3, each having a hole punched in the top, this hole having a narrow slot cut upwards. Into the back of each hive drive an ordinary clout nail; this is driven almost home, the round hole in top of tablet passed over the head of the nail, then by its own weight it drops, and the shank of the nail passed into the slot. No wind can blow it off. With a lead-pencil I write any particulars upon the tablet, which, being oxidised, takes the lead as does a slate when a slate-pencil is used: the weather will not affect the marks, though exposed for a twelvementh, yet they can easily be erased with a piece of wet flannel. Supposing hive No. 2 has been removed to hive No. 13, the labels can be altered, and you have your numbers correct; and you can also see from the tablet what No. 13 did as No. 2, and reason for moving it, &c.

Super Cleavers.—A word, perhaps, about this will not be out of place, as a good many bee-keepers, and I should like to see more, get their stuff ready in the winter for the summer use. Do not have a clearer with more than one exit, as I am perfectly convinced that one exit is much better than two, three, or more. A good many bee-keepers use the smoker, and wonder why the bees sting so badly sometimes; but if they would try the clearer, and use it properly, they will find the risk of being punished is very materially reduced, seeing firstly that the clips in the escape are in working order.

Wells Heres System. First try the ordinary barframe hive, "Cowan's" is the simplest; master this thoroughly first, and then, if you choose, try a Wells.

Naphthaliae.—Great care must be exercised in using this, as several complaints have reached me where large quantities have been placed in the hives, and in consequence the bess have been driven out and starved to death.

Stores.—Where this is possible from the top of the frames, a glance will tell you whether more candy is required or not, but in no case attempt to interfere with the frames; if food is required, place a cike of candy on the top, and close up as quickly as possible, or the beas will get chilled, but in cases where you are certain there is an abundance of food, leave them alone entirely.

ROYAL BOTANICAL GARDENS, MANCHESTER.—We are informed that the Council of the Royal Botanical and Horticultural Society of Manchester have appointed Mr. P. Weathers of Isleworth to fill the joint offices of Cinatar and Secretary, rendered yacant by the death of Mr. Bruce Findlay

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

CORRECTED AVERAGE TEMPERATURE FOR THE EN-SUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—38 9.

The "Constitution" of Flants.

17 is not necessary to attempt to define what the constitution of a Ir is not necessary to attempt to plant is. The meaning is clear enough for our present purpose. What we would point attention to now is that in our daily use of this expression, as in so many other cases, we constantly make use of bare assumptions-a practice which if at present unavoidable, is certainly not scientific. In Mr. EASLEA's prize essay on the Hybridisation of Roses, for instance, p. 7, we find it stated that if we sow a bushel of seed from General Jacqueminot, not one of the seedlings with be an improvement on the parent; "whereas in the past (before the constitution of Roses was undermined by excessive propagation, this good old variety was the parent of Duke of Edinburgh," and various others. Note, the author speaks not of this particular Rose only, but of "Roses" in general. Mr. Easlea here is doubtless in conformity with the usual belief, and no one will be inclined to question his facts. A similar complaint is rife in the case of the Champion Potato. It is the interpretation or exegesis to which we would draw attention, and we would inquire what grounds there are for the betief that rapid and extensive propagation can undermine the constitution of a variety? We are not thinking of an individual plant, but of a "variety," and we are dealing with the propagation by means of budding, not by interbreeding. The assumption seems to be that the high cultivation required to induce the plants to produce a large number of buds in as short time as possible undermines the constitution of the variety, and renders it incapable of giving rise to other varieties. The individual plant may, it is true, be enfeebled by over-cultivation, and the buds produced may at first partake of the general enfeeblement, and a "variety" is only a collection of individual plants. Of course, if the bud be kept in a feeble condition by adverse circumstances, it may be conjectured that the feebleness will become "fixed." or innate, if we may use such an expression of a plant propagated by budding. But supposing the conditions to be favourable, is it not the case that the weakly bud will soon outgrow its original frailness, and so there will be no permanent undermining of the constitution. The debilitating effect on the parent stock may and does undoubtedly operate upon the first generation of buds that it produces, but is that effect continued into future generations, when once the exciting cause is removed? We think not. The question is essentially one for the practical man to work out, as it is a most important one from his point of view: whilst it is most interesting from the stand-point of the physiologist bearing directly on the question of the inheritance or otherwise of acquired characters.

ANOTHER "lung" has been se-London's cured to the public through the Lungs. agency of the London County Council. This will certainly prove to be an added charm to a neighbourhood which boasts the vicinage of the Crystal Palace. Small parks, freely distributed and plenty of them, has always been our recommendation on sanitary grounds; and had it been possible to make two out of the twenty-two acres at Deptford, all the better would it have been for the present and future population of that distric*. It may, however, be possible to cut out a six or eight acre recreation ground by-and-by, and hand it over to that great caretaker, the London County Council. As to the expense the few following figures from the last report of the General Purposes Committee of the body in Spring Gardens may not be out of place here. The report says: -- "The following is a comparative statement of the number and area of the parks and open spaces, churchyards and playgrounds under its control at the time of its accession to the government of London, with those at the end of March, 1896. showing also the out-door permanent staff, and the annual expenditure on maintenauce at the same periods: -1880-90, 40 places; acreage, 2,656; out-door permanent staff, 333; maintenance, £52,751. Compared with 1895-96, number of places, 79; acreage, 3,686; staff (outdoor), 737; maintenance, £105,365." The increase in cost of maintenance is evident; it is to be hoped that some means may be found of achieving greater economy without decreasing efficiency. Bedding - plants and other ornamental plants requiring care in the winter, might be solicited as gifts. The ratepayers should hardly be called on to defray the cost of Inviries.

This Kentish gardening body is Beckenham distinctly entitled to rank as somewhat above the status of Society ordinary horticultural societies, seeing that not content with providing shows at which members compete for prizes, and which if displaying the beauties of garden products, do sometimes, indeed not infrequently, display also the weaker aspects of human nature; the executive have assimilated the work commonly conducted by gardeners' associations, and have engrafted upon the mere exhibition work of the society much that is essentially educational. Not only is there provided in a large room at the Public Hall a weekly winter lecture on some gardening subject, or else a discussion, but little shows of produce are held also, and rare is the meeting at which some meritorious objects are not exhibited. But the executive have gone further, and having, through the kindness of the local clergy, had placed at their disposal at nominal cost a large room in the new Churchhouse, which is in a very central position, have through the agency of their indefatigable hon.

secretary, Mr. T. W. THORNTON, of the High Street, recently established a capital gardening library, the bulk of the books being new and purchased. The shelves contain about 230 volumes, and a neat little catalogue of them has been prepared for the use of the members. Mr. M. WEBSTER, of Kelsey Park Gardens, has kindly undertaken to act as librarian, and the room is open for consultations on Friday evenings. The borrowing members of the Society have to pay 6d. for the privilege of taking out books for the season; and it is interesting to learn that although the first issue began in October last only, yet thirty-one persons now take books. It is also very gratifying to learn that the best class of books seem to be most in request, the members evidently being anxious to obtain wider knowledge of the higher branches of horticulture. There is yet ample room to add standard works to the library; but all the same, a capital start has been made, and there can be little doubt but that the books will be much more appreciated later. All the horticultural papers also are taken weekly, every one being purchased; whilst some of the better-to-do members place second copies on the readingtable frequently.

This educational aspect of the Society's work has secured wide support from the gentry of the district, as it commands their hearty sympathy. No doubt there are numbers of isolated gardeners in the kingdom who envy the privileges thus possessed by their brethreu of Beckenham. The usual weekly lecture of Friday last was delivered by Mr. A. DEAN, of Kingston-on-Thames, who took the subject of "Apples, and their Culture for Home and Market Uses," covering, in au address of some ninety minutes duration, a very wide field. A very hearty vote of thanks was accorded to the lecturer. Messrs. J. Laing & Sons, of Forest Hill, kindly sent a superb collection of twenty-four dishes of Apples, and some high-class Cyclamens. Mr. M. Webster put up four fine pieces of Calanthes Veitchii and alba, splendidly flowered in 6 inch pets.

OUR ALMANACK.—Secretaries of Horticultural Societies and others, are earnestly requested to forward immediately, the dates of Show Fixtures and of Meetings of Betanical and Horticultural Societies of any kind for 1897, for insertien in the Almanack, to be published in our issue for January 2.

THE COUNCIL OF THE ROYAL HORTICULTURAL SOCIETY.—We may remind our readers that any nemination of fellows to serve upon the Council of the Royal Horticultural Society will be invalid unless sent to the secretary before January 10. Nominations to fill vacancies, that occur annually, may be made by any fellow. Gardeners have therefore the constitution of the council largely in their own hands, and must blame themselves if it is not a reflection of their wishes.

GARDENERS' ROYAL BENEVOLENT INSTITU-HON.—We understand that Lord ROTHSCHILD has fixed Wednesday, May 26 next, for the holding of the fifty-eighth anniversary festival dinner of this Institution at the Hotel Métropole, and at which his Lordship will preside. The day selected is that also upon which the Temple Show of the Royal Horticulturat Society will be opened to the public.

NATIONAL CARNATION AND PICOTEE SOCIETY, AND NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION).—A meeting of the United Committees will be held at the Hotel Windsor, Victoria Street, Westminster, on Saturday December 19, at 6 P.M., to consider the following matters:—Place of exhibition for 1897, and schedule.

YORK "GARDINERS."—" Brother,—Yon are desired to meet the Fraternity of the most Antient Art of Gardening at the annual Feast of the Royal Society of Gardiners and Lovers of a Garden within the City and County of York: kept this Year at Mr. Simmons' House, in St. Helen's Sq', December 22, to dine with them at 6 o'clock: where you will be earnestly expected and kindly received by yo' humble serv', J. E. Wilkinson, J. Pilmoor, J. C. Milburn, Stewards,"

"THE GARDEN ANNUAL."—This is the first of these indispensable gardeners' directories to come

pondents in the United States. His connections here date from the time of Downing, who imported plants from Knap Hill for the Capitol grounds at Washington. After Downing's death the unpaid bill for these plants was found among his papers by his executor, HERRY WINTHEOF SARGENT, of Fishkill. Mr. SARGENT was a classmate of CHARLES SUMNER, and through his assistence he succeeded in obtaining from Congress an appropriation to pay this bill. From this spring the friendship which existed for years between Mr. Waterer and Mr. Sargent, who for many years was one of the principal horticulturists of the United States. From this friendship other

WINCHESTER GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION—On Tuesday, the 5th mst, Professor Gillings of the Inversity Extension College, Reading, gave a lecture on "Manures," being a continuation of the previous lecture on "Soils and Manures." Professor Gillings began by speaking of the experiments which were carried out by Messis Section & Sons, Reading, last season, and spoke of the use of lime on some kinds of soils, and the mode and best time to apply it. The lecturer then took up the subject of artificial manures, mentioned the sources whence they were obtained, and what substances they consisted of advising those who

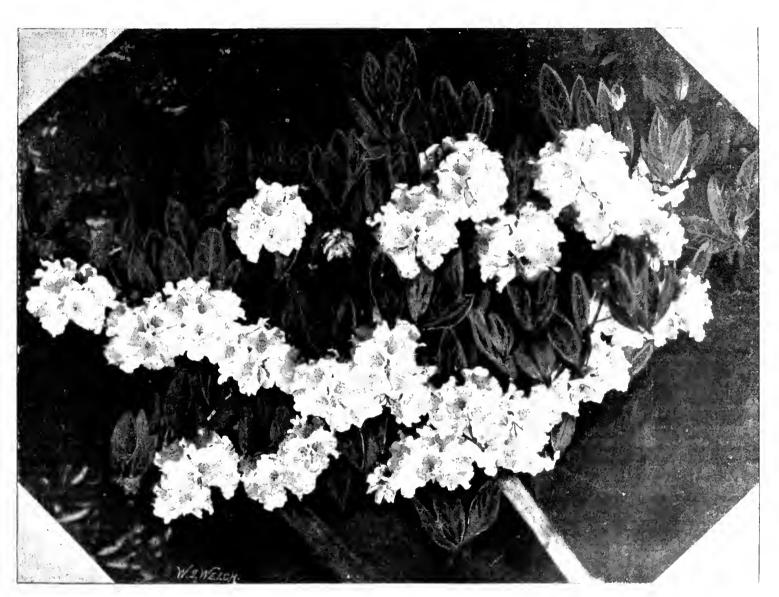

FIG. 131. - EHODODENDRON AUBOREEM, CAMPBELLIA SEE P. 71.

to hand. It is replete with the kind of information which we are accustomed to find, and is nseful to editors, gardeners, nurserymen, and other business men. We notice a welcome addition in the present issue of a list of the principal horticultural and botanical societies in the United Kingdom, in which we should have hked to have seen included Ireland. The new plants, fruits, and vegetables which have received Certificates from the Royal Horticultural Royal Botanic, and National Chrysanthemum Societies from Nov. 20, 1895, to Nov. 17, 1896, are mentioned, together with the names of the raiser or exhibitor.

THE LATE ANTHONY WATERER.—ANTHONY WATERER, says Garden and Forest, had many corres-

sprung, until gradually all the principal cultivators of hardy trees and shrubs in the United States became friends and clients of Anthony Waterer, who of late years has devoted special attention to breeding Rhododendrons capable of supporting the climate of this country. In 1876, when the Knap Hill Nursery may a special exhibit of Rhododendrons in Philadelphia, Mr. Waterer visited the United States. A man of the highest integrity, rough in manner, but kind of heart, Mr. Waterer was a type of the English cultivator of the old school not often seen now. We all owe him a debt of gratitude for the plants he has produced for us, and those who have had the advantage of his friendship will never forget his strong and interesting personality.

wished to use these manures, to first find out what the crop it would be applied to most required, and not to buy the mixed manures, these being the more expensive ones, which might not give the de red results. A discussion took place at the close.

LINNEAN SOCIETY OF LONDON—On the organism of the meeting of this Society on December 5, Mr. C. B. Clarkl, M.A., F.R.S., Vice President, in the chair, Messis, A. B. Freeman Mittack and Lakward Step were admitted; and the following were elected Fellows of the Society:—Messis, W. H. Betts, E. J. Beckford, F. Escombe, R. N. Lyne, F. Roper, F. G. Sinclair, and Hon. Walter Rothschild.—Mr. R. Morton Middleton exhibited and made remarks on specimens

of Acer dasycarpum strangulated by Aristolochia tomentosa. He also exhibited examples of Helix Cumberlandiana, an extremely local land molluse from the carboniferons limestone of Tennessee. Mr. E. M. Holmes exhibited specimens of Liebmannia major, a seaweed not hitherto detected in Britain, and, so far as is known, recorded only from Finisterre. The specimens were collected at Lossiemouth in August, 1896. He also showed Bonnemaisonia hamifera, collected in May last by Mr. E. George, and in August last by himself. In 1895 living specimens of this scaweed, a native of Japan, were found at Falmouth by the late Mr. T. R. Buffham; and during the present year other examples had been found at Shanklin, Isle of Wight, showing that the plant had apparently become naturalised.

apparently become naturalised. The Rev. George Henslow, M.A., &c., then gave the substance of a paper entitled, "Does Natural Selection play any part in the Origin of Species among Plants? After defining a species from the point of view of the descriptive botanist, viz., that it may be known by "a collection of actually or presumedly) constant characters, taken from all parts of the plant," the author showed by examples that many recognised specific characters are either useful (as the runners of Ranunculus repens); indifferent or useless (as the numbers I's and 5's in a flower), or injurious as the hindrances to fertilisation in most Orchids); and that all specific characters were the direct results of a responsive action on the part of the living protoplasm to the influences of the physical environment, and in the case of flowers to the methods of fertilisation of insects, &c. The question of the origination of varietal characters, he thought, should be considered as quite distinct from "the struggle for life," and "the survival of the fittest," which determine the distribution of species in time and space. The only two sources of "indefinite variations," as Darwin called them, out of which natural selection was supposed to select the best fitted to survive, and so originate species, was shown to be either inadequete or fallacious; for the one consists of the so-called "individual differences," by which term Durwin and Wallace signify the slight differences seen among individuals of the same species, so that no two are ever absolutely alike. Mr. Henslow proved by examples from Nature and cultivation that dwarfs and giants among plants show no tendency to die, as Wallace maintains they should do, if the dimensions of any organ fall short of or exceed certain limits beyond the average. These fluctuating differences in the size of leaves, flowers, &c., are simply due to the inexace laws of growth, and depend on different amounts of local nourishment. They do not give rise to varieties (as recognised by systematists) unless the surrounding conditions be altered, as by migration. Thus, Ranupoulus Ficaria has produced no variety in England, but assumes the form calthæfolia along the Mediterranean. Darwin and Wallace assumed as necessary conditions for natural selection (1) a large number of individuals, so that a struggle could arise; (2) infertility with the parent form, so as to avoid the crossing of the offspring; but such is not known to exist. Mr. Henslow showed that (as a rule) plants remarkable for growing in large masses, as Heatlis, Daisies, Blue-bells, Caltha palustris, are just those of which varieties are not recorded. On the other hand, many others vary greatly, but only when on different soils, &c., as Polygonum aviculare (as described by Hooker in the Student's Flora). Instead of "changed conditions of life" happening to the plants without their migration, as by some geological catastrophe as Darwin and Wallace appear to require), it is migration which really supplies them; and instead of a struggle being required with the parentstock or other plants, it was the avoidance of the deteriorating effects of struggling which was most beneficial; and new varieties arise best where there is no struggle at all. Such conditions are precisely what cultivators aim at. Changed conditions of life are supposed by Durwinians to supply the second source of indefinite variations for natural selection. for Darwin thought that they induced the offspring to vary in all soits of ways, so that natural selection indected the one or few most suitable for the new

conditions, all the rest perishing; but as Mr. Henslow showed by illustrations both from Nature and cultivation, that changed conditions of life always produced what Darwin called a "definite action, the result being that all the seedlings varied alike and in adaptation to them. The result is that (as Mr. Romanes said, if "indefinite variations" did not exist) "Darwinism is destroyed in tota"." The relative persistence or non-retention of specific characters was discussed, and it was shown that the permanency and heredity of acquired characters required time, five years being perhaps the average under cultivation. Permanency was only a relative term, all plants being liable to change again-hence arose improved varieties of long-fixed races of cultivated plants. Lastly, the author showed that Darwinism, or "the origin of species by means of natural selection," was based on a series of a priori arguments or deductions which had not as yet been verified, and did not appear to be capable of verification. On the other hand, new characters under changed conditions of life were to be seen everywhere, both in Nature, under cultivation, and to be induced to arise by experiment; so that adaptation to new conditions was proved inductively to be the true cause of the " origin of species." This was Mr. Herbert Spencer's view in 1852, when no thought of "natural selection" as a "means" had been suggested. After criticism by the chairman, a discussion followed, in which the following gentlemen took part :- Mr. A. W. Bennett, Dr. D. H. Scott, Prof. Mivart, Mr. A. O. Walker, Prof. J. B. Farmer, Mr. J. T. Cunningham (late of the Marine Biological Association, Plymouth), Mr. H. Groves, Mr. A. B. Rendle, Mr. N. E. Brown, and Dr. Haviland.

THE BEST METHODS OF PRESERVING FRUIT. -Parisian salesmen complain, says the Recue Scientifique, that often fruits which have a satisfactory appearance on arrival soon become spotted and mouldy, and consequently are much deteriorated in The Galette Agricole gaves the report of interesting experiments made to test the value of various methods used to ensure the preservation of fruit before it is sent into the towns. The following is the result of these trials:-1. Fruits wrupped in tissuepaper kept perfectly to the end of the trial; they ripened steadily, the fruits continued excellenting wour and appearance. 2. in wood-wool, a new product consisting of fine shavings, very long and narrow, from Fir of Popular. The Pears and Apples were well preserved, but inferior to those of the preceding lot. 3. In Barley-straw the fruit had neither spots nor a disagreeable scent, but it had lost its freshness, and maturity was more advanced than in lots I and 2. 1. Pears and Apples kept in hay had a pronounced flavour of it they became spotty and rotten, J. Sawdust yielded very bad results; the fruits were spotted. withered, smelt of the wood, and were, in fact, unsaleable. 6. In fine Wheat-straw the Pears kept fairly well; the Apples, on the contrary, witheredall were mouldy in taste. 7. In dry leaves Apples kept fairly well, but withered a little; Pears became very spotted and withered. 8. Fruits left on a fruitroom shelf were in moderately good condition; but, placed in a warm-room, this lot suffered most from decry. 9. Specimens packed in sand were perfectly preserved, but ripened less than under any of the other conditions; this is the best method where fruits have to be kept for long; before burying them in the sand it is advisable to wrap them in tissue-

THE WELSHPOOL HORTICULTURAL SOCIETY.—The statement of the Welshpool Horticultural Society, read at the annual meeting held recently, is satisfactory in every way. If there is not added a large surplus to the balance carried forward from last year, it is proved that the annual show is increasing in favour with the outside public. It was said at the meeting that the Society was formed for the benefit of the town; and to give some tangible proof of this, a sum of £50 was voted to the building fund of the Welshpool lutermediate Schools—a very opportune donation.

NATIONAL CHRYSANTHEMUM SOCIETY .- . 1 meeting of the general committee was held on the 14th inst., when Mr. C. HARMAN PAYNE presented a full report of the proceedings of the various continental Chrysauthemum shows recently visited by the deputation appointed. This report will be printed in the Report and schedules for 1897. It was resolved that the early Chrysanthemum and Dahlii show should be held on September 7, 8, and 9, a little later than usual, in the hope of obtaining a better display of Chrysmtheniums. Those meetings of the Floral Committee which will not fall on show days, will take place on Moudays at 3 p.m., and, as far as possible, on the days when the general committee meets. The exhibition on October 12, 13, 14, November 9, 10, 11, and December 7, 8, 9, together with the early show in September, to take place at the Royal Aquarium. A strong sub-committee of growers was appointed to take into consideration the classification of certain incurved varieties of Chrysanthemoms which are regarded as of doubtful character, and report to the general committee. J. W. Tuomas Bevan, the chairman of the Floral Committee was requested to act as the chairman of this committee, which consists of Messrs. E. Beckett, C. Gibson, H. J. Jones, J. Lync, W. H. Lees, Geo. Langdon, W. Mease, G. Stevens, J. II. Witty, J. Wright (Temple), R. Owen, E. Rowbottom, G. Gordon, J. W. Moorman, C. H. Payne, and R. Dean. It was resolved that Gold Jubilee Medals, and an illuminated address, be presented to the two Hon. Sees., Messrs. R. Deau and C. Harman Payne, for their services to the Society in connection with the Jubiles celebration. Eight new members, including two Fellews, were elected, and the Leyton and District Chrysanthemum Society was admitted to addition, the Secretary reporting that since January I, thirteen Fellows and 188 ordinary members had been elected, and twenty-seven societies admitted to affiliation.

THE HORTICULTURAL INSTITUTE.—The need of a Central Home for all the existing horticultural societies is admitted on all sides. Is there any chance that this need can be supplied? Mr. J. L. Woon, whose scheme we publish in our present issue, is of opinion that it can. "As many as are of that opinion be pleased to signify the same in the usual manner."

THE NATIONAL AMATEUR GARDENERS' ASSO-CIATION. On Wednesday, the 16th inst., was held, in the Throne Room of the Helborn Restaurant, the annual dinner of this flourishing combination of amateur horticulturists. A company of nearly 100 ladies and gentlemen was present, and the chair was taken by Mr. T. W. SANDERS, the President of the Society, who, in proposing the toast of the evening, made some interesting remarks upon the aims and purposes for which the Institution was established. The success that had attended the efforts which had been put forth was so satisfactory, that it more than justified its existence, and proved conclusively the need that existed for such an association. The chief benefits that had at present been secured to its members were those resulting from the means the Society had given them to meet together at frequent intervals in a fraternal manner to exchange notes and experiences, to hear lectures upon subjeets of importance to ladics and gentlemen engaged in horticulture upon a more or less limited scale, and to exhibit and see exhibited the best results of horticultural practice that had followed the members' efforts in the garden. At each of the monthly meetings "points" were awarded to exhibitors, who upon obtaining a certain aggregate were awarded valuable medals, and other souvenirs. The total membership now amounted to 528, and an increase had been made during the current year of 157. In addition to the central body, there were branchos at Cape Town and in New Zealand, There were affiliated societies also in the provinces, and thus the Institution exerted an influence tending to the fostering and encouragement of gardening over a much larger number of persons than the actual membership indicated. In regard to the future, the president's

remarks were distinctly aggressive, and urged each of the members to endeavour to make the society more powerful and useful, by securing an increased membership. Since its formation six years ago, its growth had been phenomenal, and this satisfactory state of affairs must be maintained. The assistance that had been given in the past by the various officers, was cordially acknowledged. During the evening the presentation took place of the various trophies, medals, and prizes that had been won during the year; some of these which had been offered by members of the trade representing considerable value. Many other speeches were made, and the proceedings enlivened by songs and music; indeed, the programme arranged was so long, that we would suggest it would be better in the future to curtail it, or to meet at an earlier hour in the evening.

PLANT PORTRAITS.

ASPIDIUM SIMCLATUM, Garden and Forest, December 2 Dilembium Zalli, Gardon, November 28. See Gardonor's Chronole, Aug. 29, 1896, p. 247.

REMOVING AND TRANSPLANT-ING FRUIT AND OTHER TREES.

Ar the present open season nurserymen are still busy in most districts executing orders, although, as everyone knows who has been engaged in planting, the work can be better done in November. My father used to say, "Plant before Christmas, and you can command them (trees, shrubs, &c.) to grow, but after you must ask them to do so," and I fully endorse this maxim.

But nursery stock is of such a peculiar nature, that when it has been grown, another important operation has to be performed ere it can be put on the market -as they say in New York; for before it can be delivered to the purchaser it must be dug up, and the more efficiently this work is performed, so much the more likely are the plants to thrive when planted in their new home. In many nurseries it must. I fear, be confessed, this kind of work is roughly done, but nowhere more so than in American nurseries, which, to follow the rule of all Yankeo matters, are "big things," the quarters of fruit and other trees very extensive, and the length of the rows "prodigious," a mile long, I have heard, which, with trees, say, 6 inches apart, would give over 10,500 to the row; again I can but exclaim, with the Dominie-" prodigious."

To deal with such, ordinary European methods would be comparatively useless, so space is left between every third row, down which a horse or a tindem of mules may draw a peculiar foot-plough, ploughing out the poor trees, quite regardless of their roots, or limbs-indeed, going ahead, regardless of heads or tails, taking only into account the quantity, not the quality, of the work done. It must follow, therefore, that many of the young trees are rained by this very rough treatment.

English and Scotch murserymen would hesitate to get up even torest stuff or hedgerow plants in such a cruel fashion , but it must be borne in mind that at the seas in when such work is possible, days are short, and orders pressing, so that some excuse must be made for the seemingly careless manner in which this important work is done in some nurseries. It may be some satisfaction to know that across the "Herring-pond" they do it no better. In dealing with fruit trees first, the stocks are, as a rule, "nicked" in -that is, planted on the side of a treuch which has been cut straight, and the soil added as the work proceeds by another man, who at the same time fixes the stock firmly by trampling the soil. It follows, therefore, that the larger proportion of the roots are on one side of the trench, viz., that on which the fresh soil

is placed. In the lifting (getting up) process, therefore, a trench is dug on this side of the row, and then another man with a draw-spud, which is a heavy solid tool, with a long iron-shod handle, drives it down at a slight angle as far into the soil as he deems necessary, and then uses it as a lever virtually to lift the tree out of the soil. This is neither a difficult nor a dangerous operation where pyramidal trees are concerned, as both the Paradise stock for Apples and the Unince stock for l'ears have a wholesome tendency to produce roots on the surface, or just below it, and such trees come, as we call it, freely; carrying, as a rule, nearly all their roots, and what is of more consequence, their rootlets or finer fibres.

When, however, we have to deal with standard Apples on the Crab, or Pears on the Pear stock in the same form, such trees must necessarily have been three or more years in the ground, and if the soil be stiff and clayey, they will, in this time, have developed long and stout tap-roots. Then, indeed, it is a question of a long pull and a strong pull, and a pull altogether, and not infrequently the tap-root suddenly gives way, and with laughter, and sometimes I fear with rough language, the workmen come to the ground in a melec, and the root remains broken in the subsoil. Unfortunately, this tree may be a "marked one," for in many nurseries customers are allowed to chose their own trees, marking them with a piece of bast, or a label attached No doubt they should do this if they wish to secure the best and most fit trees for their purpose, and will plant only such. However, as a tree with scarcely any roots can hardly be sent, the broken and torn roots are cut cleanly off, and it is replanted, and another as uearly like it as possible substituted. Such accidents are among the many minor troubles a nurseryman meets with in his business. Experience.

TRINIDAD ORCHIDS.

GONGORAS. -Grisebach's Flora of the West Indies records Gongora atropurpurea, Hook., as indigenous to Trinidad. Hooker's Exitiv Flora relates that a plant was sent in 1825 to the Liverpool Botanic Garden from Trinidad by Baron de Schach. The Kew List (1896) gives it as a native of British Guiana. Dr. II. H. Rusby's late expedition to the delta of the Orinoco found it fairly plentiful there, so that it will probably be found in the greater part of the tropical regions of South America on the Atlantic slope. It is a plant that flowers freely every year at the gardens, growing upon blocks of wood or bark without covering of any kind at the root. Gongoras, like several other Orchids, have when in good health two classes of First, the main or clunging roots, and secondly the upright or vertical. These upright or vertical roots are found in Gongora, Coryanthes Catasetum, and Epidendrum, and always commence growth during the moist season, having the green and growing point exactly vertical. Ou this point are to be seen in damp weather radiant globules of moisture. In dry weather the green and growing point entirely disappears by gradually tapering away into a needleshaped point, when it becomes covered with the white covering common to the clinging roots, and becomes practically non-absorbent.

These roots are similar to those exhibited by Mangrove and other swamp plants. If the surroundings to lagoon plants are exunined closely it will be found that, proceeding from the roots which are below the surface of the mud or water, there are countless thousands of tips which are exactly perpendicular. That these roots perform some function, important both to Orchids and to Mangroves, &c., is clearly apparent, as where they are most abundant the plant and the tree is most vigorous and in the most robust health. But what that function is exactly, is not yet clear to us, but the feature is such a notable one. that it is fully deserving of further close enquiry.

Besides Gongora atropurpurea we have Gongora maculata, Lindley, which is given by some as a synonym of Gongora quinquenervis, Ruiz and Pavon. This is a much prettier Orchid from a florist's point of view than the first mentioned, and flowers more freely.

Beside these, we have another Gongora which has a straw-white flower, and is distinguished by lighter coloured pseudo-bulbs, but for the present we place this with the last named as a variety. Whether the two latter are deserving of specific distinction is a matter for specialists to settle, but the variation shown in the form of the bulbs, and the colour of the flower leads to the belief that the three are merely forms of the one species indicated by the flower being almost identical in form, no matter what colour is assumed or what shape is put on by the pseudo-bulb.

Whether they are eventually proved to be species, or mere varieties, it still remains that there are three forms of Gongora native to Trinidad :- 1st, the dark purple; 2nd, the spotted; and 3rd, the strawcolonred; all of which are easy of cultivation at or near to sealevel in positions sheltered from the wind, Trinidad Bulletin.

FOREIGN CORRESPONDENCE.

CYCLAMEN BUDS NOT DEVELOPING.

The various correspondents who have complained of having trouble with Cyclamen buds not developing, are suff-ring from a trouble that has been quite prevalent here during the past few years. We had no difficulty in growing good plants, and advancing them to the point where great expectations were eventually doomed to disappointment. It seems that as long as plenty of moisture was present in the atmosphere and about the plants as in the growing season outdoors, all went well, but as soon as all were housed for the winter, and fire-heat was necessary to keep out cold, the buds with few exceptions failed to develop, and those that did flower were mere abortions. Examination under the microscope I have no doubt will reveal to English gardeners, as it has to us, the fact that the injury is due wholly to the minute white thrips, and it will probably be found that the whole surface of the nudeveloped petals has been cateu over in the bud stage, as can be readily seen on the few flowers that have developed at all. We have found that there is no remedy so effective as tobacco; it has come to be necessary for us to keep the plants enveloped in tobacco from their youth up, using tobacco-stems between the pots all the time, and a frequent dusting in the centre of the plants at intervals after the buds have begun to develop with good strong tobacco-dust.

After having failed for the past three years to tlower well-grown Cyclamen, and being fairly sure of the reason -- for our plants are this season the best we have ever grown, it may interest growers at home to learn of this experience, the more so as it has been quite general in this state among gardeners. It is just possible that in English gardens, where the stem or mid-rib of the tobacco-leaf is not available, as it is here, it may be found that some one of the several good funnigating preparations may do the work. XL All ought to be very efficient if it is as I am led to suspect, that thrips are at the bottom of the trouble. E. O. Orpet, South Leneaster, Mass., U.S.A.

MEXICAN ECONOMIC PLANTS.

(Combaded from p. 719)

Chiele. - The Zapo'e tree, or Chico Zapote, is one of the sources of the Chiele chewing gum, indeed, it is said to be the most abundant new important source. It is the Achras Sapota, and is found growing wild and enltivated over a large area. Two kinds are known, the red and white, the latter producing more gum than the former, the yield being as much as 6 lb. per tree, while the red furnishes not more than 3 to 4 lb. The white forms a tallor tree, and the red a greater diameter of trunk and a thicker bark. The fruit is spherical, sometimes 2 to 3 inches long, the edible or pulpy portion is white, and when ripe it has the taste of a Pear.

A warm moist climate is necessary for the successful growth of the tree, it large crops of gum are expected. Higher than lat. 22 N. it will not grow at all, and north of Vera Cruz city it will not do well

in the mountains above 2000 feet; however, south or 19 N. lat. it is cultivated at altitudes as high as 800) and 4000 feet above sea-level—yet it will thrive best at elevations between 150 and 1200 feet even in these latter regions. The Zapote can be propogated from cuttings, suckers and layering, but the tree grows readily from 'the seed, and that system has been adopted by those who plant it. Nursery beds are prepared in the usual manner in a halfshaded space close to a stream. The hard, shiny seeds may be placed in warm water for ten or twelve hours and then sown 6 to 8 inches apart, and at a depth of I inch in the soil. This can be done in the months of October and November, if mist and slight rains follow, otherwise in July, or in the regular rainy season. When the scedlings are 15 to 21 inches high, they must be transplanted. A good site having been selected in forest land, in the month of May, all undergrowth must be cut down, as well as young trees up to those of a inches in diameter. Here and there a large tree should be felled so as to open up the land to some of the rays of the sun, as the Zapote is partial to sunshine and air. The trash may be forked in or allowed to rot on the ground. In the latter part of June, or in the beginning of the rainy season, holes 1 foot or 15 inches deep, and 1 foot 6 inches wide, are then to be prepared at distances of 12 feet, if the Zapote is to be planted alone. But as Coffee or Rubber trees are staple trees, requiring the same climatic conditions, and can be planted between the Zapote, in such case each kind of plant must have a distance of 12 feet apart, thereby having 302 Zipote trees and the same number of Coffee or Rubber trees to the acre of land. Surface soil is then filled in, and the seedlings are set in the holes when the moon is on the wane, but they must not be plinted too deep or they will rot off. As the tree is a hardy one, the expense of keeping the plantation clean is small, one or two light weedings a year being all that is necessary. At the fourth or fifth year after transplanting the tree it may be tapped, but it is best to wait until the sixth or seventh year, or when they are 12 to 15 inches in diameter, wherein better results may be obtained. The tree lasts over 100 years, and then or before its fine wood can be utilised for the minufacture of first-class furniture or for durable timber. The gum is produced from the leaves, fruit, and bank. From the fruit it is extracted in the months of March and April before it becomes ripe. When gathering the fruit, the stem is allowed to remain on it, but subsequently taken off to admit of the juice running out. This is collected in a shallow vessel, permitted to solidify, washed in warm water to collect and clean, and then boiled down to evaporate the water, set aside to cool, and, lastly, formed into blocks to be thus marketed, 3200 Zapote fruits produce 1 lb. of gum. The fruit is also sold at about one cent a piece in Vera Craz, Puebla, Oaxaca, Orizaba, and other large cities, and latterly has been exported to the Unite I States. In September and October the gum is extracted from the leaves. The process is the same as that of the fruit and the yield alike.

After the rainy season is over, generally in October, the trees are tapped once a year. The custom of the natives, the "Chieteros," is to climb the tree, often 40 feet, make three diagonal cuts by a double oblique blow of the machete on either side of the tree, and join the wounds at their lower ends. A shallow tin vessel is tied on to the tree below the wounds to collect the juice. The operator then leaves the tree and proceeds to tap another. He performs the operation in twenty minutes, and it takes three-quarters of an hour for the tree to bleed itself. One man will tap from twelve to sixteen trees per day, each producing from 3 lb. to 6 lb. of juice. This is collected in gourds holding 12 pints, and it is heated in an iron pot antil it boils up, when it is stirred with a stick, quickly and continually eatil the feaming gam subsides and has been reduced to half: when cool, it is washed in water and formed into blocks of 2, 4, 6, and 12! lh. cach. The present system of tapping, it is suggested, might be improved upon, and the juice strained before being boiled down. Enormous quantities of this chewing-gum are sent to New York

Canatigre. - The notes on the cultivation of sarsaparilla, jalap, and liquorice are of a character more familiar to us on account of recent publications; so that we omit any further notice of them for the sake of giving fuller details to what is a comparatively new introduction to the tanner, namely, the Canaigre Rumex hymenosepalum). It is found within the valleys and depressions of Western Texas, Arizona, New Mexico, Mexico, and California. It is found for the most part on sandy loam, and is most luxuriant in moderately moist localities. The root contains from 25 to 33 per cent. of tannie acid, and has been fully demonstrated as a fine material for tanming leather. It has also some reputation among the Indians and Mexicans as a medicine, acting as a purgative when taken in large quantities. The roots or tubers of the Cauaigre-plant have the general external appearance of Sweet Potatos, there being from three to a dozen to each plant, varying from 2 to 18 oz. in weight. Though for years Canaigre has been used by the Mexicans, both medicinally and for tanning purposes, it has but recently attracted the attention of the outside commercial world as a valuable tanning substance. Numerous analyses, both in Europe and America, have proved this, and the result of these investigations has been to create a great demand for it in the tanning trades of Europe, and more recently in the leather-making centres of the United States. The only supply now to be obtained is from the wild plants growing along the rivers and valleys of Western Texas, New Mexico, and Mexico. Careful estimates show that an acre of Canaigre, properly cultivated, will yield from 20 to 30 tons of green roots, equal to 7 to 10 tons of the dried material ready for shipment. at the lowest estimate of both yield and price, an acre of Canaigre would bring 175 dols., but probably 225 dols, would be a safe and reasonable estimate of the value per acre.

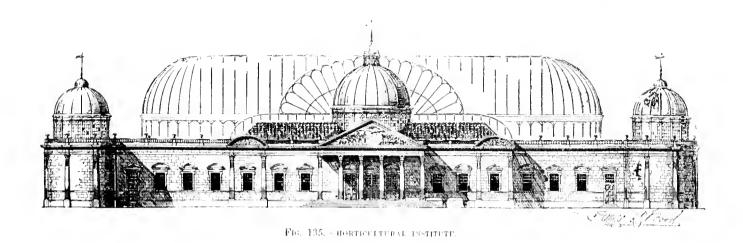

It appears in February, just after the rainy season, ipens rapidly, and is ready to harvest at the end of May. Sometimes it begins to grow in the autumn, continues growing during the winter - of course, in countries where the winter is not severe, and gives in the spring a very strong plant. The plant produces its seeds, but it is reproduced from the roots, because no experiments so far have succeeded in doing much with the buds. The old roots, as hard as wood, and almost black, are especially rich in tannic acid. The stalks, stems, and leaves, also contain tannin in sufficient quantity to pay for harvesting. Age adds to the roots an excellent colouring matter. The oneyear-old roots yield from 20 to 25 per cent , the older roots 25 to 40 per cent. From 6 centners, or 112 lb., of fresh, 2 centuers of dry, or 1 centuer of extract is obtained. By taking the extract from roots and leaves where the plant grows, much money might be saved, and losses due to transport spared. The refuse could be used to burn, or as cattle-fodder, for which purpose it equals straw.

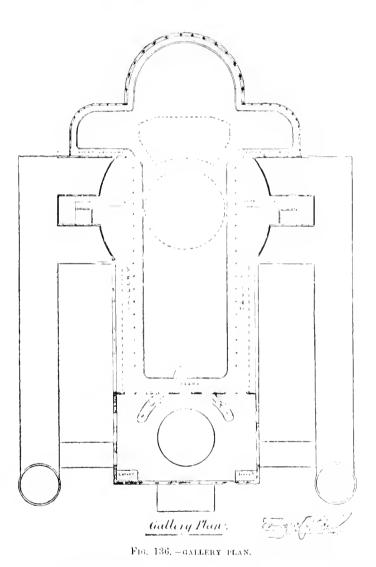

In extracting the tanne, it is best to cut up the roots, and to use a diffusion-method similar to that used in extracting sugar from cane or Beetroot. It is necessary to use copper kettles, as the Canaigre influences, and is influenced by iron. It is well also, when extracting by means of lye, and when steaming, to use vacuum-pans, otherwise the taunic acid runs the risk of becoming gallic acid. By steaming under small pressure, there is no loss of tannin, and an excellent extract of a bright colour, easily soluble in water, is obtained. As is well known, most American leathers are tanned with Oak and Hemlock burks, and even America, with its almost boundless forests of Oak and Hemlock, imports tanning materials in large quantities, so that all the world over there is a large and increasing demand for these substances. Some of the advantages of Canaigre over other materials is, that it gives to leather a full, smooth, and good grain, and a soft bright colour. It is especially suited to uppers, saddles, and fancy leathers. It is said to have been used by the Jesnits in Lower California some 200 years ago, but as it was thought to contain too much tannia, and its proportions were scarcely understood, it did not become generally used. J. R. Jackson.

PROPOSED HORTICULTURAL INSTITUTE.

PART I .- THE PROMOTION AND FORMATION.

- 1. The Need.—The need for a metropolitan horticultural institute has been recognised for years, each succeeding year accentrating the need, until this year we find from all parts of the country letters and suggestions for its early establishment.
- 2. The Opportunity.—No better menument can be raised to perpetuate the memory of Her Majesty's beneficent reign than the establishment of a "Home of Horticulture," a "Victoria Palace," or "Queen's Home of Horticulture." The present is the tims for its inaugmration, and all that is required to carry ont the scheme is united effort.
- 3. The Start.—The first step appears to be the formation of a body of trustees, to be elected from the Councils of the Royal Horticultural Society and other Societies, whose co-operation is, of course, essential; and it is confidently hoped that a sufficient number of gentlemen of indusence may be induced to act as trustees. These gentlemen, and others, should be solicited to give the start, and also to appoint the transurer, secretary probleme, and banker.
- 4. 8 cmd Step: Deputation to the Right Hon, the Lord Mayor.—A deputation from the trustees should wait upon the Right Hon, the Lord Mayor, and lay before his Lordship the needs of horticulture, and request that a meeting be held at the Mansion House to consider the desirability of founding a Metropolitan Home of Horticulture in honour of the sixtieth year of Her Majesty's reign, and to decide upon the most suitable site for it. If possible, H.R.H. the Prince of Wales should be approached respecting this meeting.
- 5. Third Step Rose Festival and Ranquet at Mansion House.—The Rt. Ilon, the Lord Mayershould be waited upon at an early date and petitioned to give the first impulse to the movement by helding a Rose festival in the Egyptian Hall, upon the same lines as those so successfully held during the mayoralties of Sir J. Whitaker Ellis and Sir David Evans. If convenient, this would be about Jane 20, 1897. The Rose festival to conclude with a banquet in aid of the funds.
- 6 Fourth Step: Proxincial Rose Festivals.—That all the Horticultural Societies in Great Britain be communicated with, and urged to take a prominent part in the scheme for the establishment of the Home of Horticulture by holding Rose festivals (Victoria Rose Festivals) about June 20, or other most convenient date, on behalf of the institution. No more appropriate exhibition can be held on that day than one of Roses (our national emblem), but the details of these exhibitions would be left to the respective committees. These floral festivals might all conclude with a banquet to augment the funds. To the gifts already promised, and special large douations expected (and I would add with the earnest trust that my wish may be acceded to, the invaluable support of the horticultural papers) may there be added the Nation's affectionate tribute in commemoration of our beloved Queen's glorious reign. I hope the horticultural Press will open their columns for subscriptions, however small, with a kindly word from the pen of a ready writer. By their aid in this united effort, I feel confident success will be ours, with a balance to spare to enable us to add to the tribute by a gift to the benevolent societies.
- 7. Life Governors.—Every society remitting £50 from its Rose or other floral festival should be represented by one Life Governor, who should be elected by the members of the contributing society.
- 8. Associates.—Every society remitting £25 from its Floral Festival to be represented by one associate, who should be elected by the members.
- SA. Financial Statements to be prepared, audited, and signed by the Trustees, a copy being sent to each contributing society.
- 9. Fifth Step.-Meeting of the Trustees should be

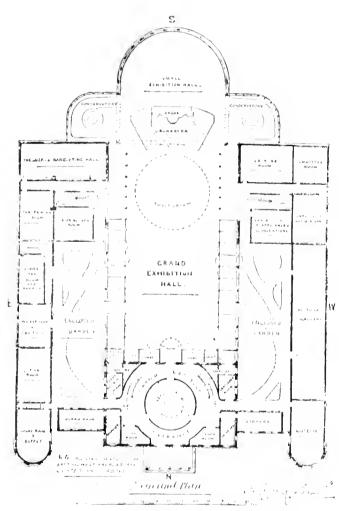

Fig. 137. - GROUND PLAN.

The Basement Plan is not given here; it contains Kitchen, Engine-rooms, Store rooms, and other Offices. Of course, the Plan-may require modification or ording to site,

held to receive the Secretary's report of the result of the Rose and other floral festivals, and to appoint delegates.

PART II.—THE ESTABLISHMENT.

10. First Step.—The Secretary to summon a meeting of the General Council, which should be composed of the Treasury Board (Trustees). Life Governors, and, as an ex-officio member, the secretary, to consider the financial position.

11. Second Step.—The Secretary would summon a meeting of the Committee of "Ways and Means" to report procedure. The "Ways and Means Com-

mittee" should be composed of Associates and Life Governors and Secretary.

12. Third Step.—The start having been made by the Rt. Hon the Lord Mayor, the Royal Horticultural Society, and the 400 horticultural societies, as representing horticulture, a deputation should be appointed to wait upon the Masters of the several Livery Companies of the City to solicit their cooperation, and the appointment of a Life Governor to the General Council from each City Company, contributing at least £50.

13. Fourth Step.—The General Council should be

further strengthened by the admission of head-gardeners at half the usual qualification fee for Life Governors, viz., $\pounds 25$.

14. Fifth Step. The Ways and Means Committee should be strengthened by the admission of headgardeners at half the usual qualification fee for Associates, viz., £12 10s.

15. Sixth Step.—The executive body having been fully constituted, a general meeting should be called by the Secretary to formulate rules, determine procedure, and to appoint a chairman and secretary for the General Council, and also for the Ways and

Means Committee. It will be seen that, by these means, we should secure a thoroughly representative constitution, in which all interests would have fair consideration.

PART III.-REVENUE.

- 16. First Step.—The financial statement having been sent to each contributing society or body (Clause 8A), the Secretary shall forward copy of rules as formulated (Clause 15) to each society and body, soliciting the support and co-operation of every individual member upon the following basis:—
- 17. Fellows.—Any lady or gentleman can be enrolled a Fellow of the Institute npon payment in advance of an annual subscription of Two Guineas. This entitles to free admission to every horticultural meeting held during the year (except the Benevolent Festivals, and such others as may from time to time be found necessary by the Council), with two passes to reserved seats for each, and free access to the Library.
- 18. Members,—Any lady or gentleman can become a member of the Institute upon payment in advance of 21s. The membership gives free admission to all horticultural exhibitions during the year with the exceptions above alloded to.
- 19. Subscribers.—Any lady or gentleman who subscribes 10s. 6d. per annum (in advance) should be furnished with a coupon admitting to fifteen ordinary horticultural exhibitions in the year.
- 20. Contributors, -- Any lady or gentleman who contributes 2s, 6d, per annum (in advance) should receive a voucher admitting to three ordinary horticultural exhibitions in the year. Ladies and gentlemen resident 50 miles and beyond from London should have the same privileges on reduced terms.
- 21. Admission to Public.—The admission to the public is fixed at 1s, each person every day excepting on special occasions.
- 22. Gardeners' Privileyes. All accredited gardeners should be permitted to participate in any of the above privileges at one-half the usual charge for Fellows and Associates, and have also the use of the Gardeners' Club-room, where refreshments might be supplied to them at a reduced tariff.
- 22a. Echibitions, -1t is contemplated that prizes should preferably be either money or useful articles, together with special awards for meritorious exhibits which have not obtained prizes, to encourage cottagers and others. Shows of wild flowers, exhibits representing bee culture, and all similar country inclustries, to be periodically arranged.
- 23. Trade Support. The cooperation of the horticultural trade should be solicited, 500 feet run in the galleries being reserved for their use at a moderate rental; and where attendants are not necessary, the letter-boxes would be cleared daily by the secretary, and all communications be at once forwarded by post to the exhibitors. Collecting-boxes would be supplied to the trade on behalf of the Gardeners' Benevolent and Gardeners' Orphan Funds, such boxes being collected by the secretary seven days before the annual Benevolent Festival.
- 21. Stewards (Benevolent).—The stewards for benevolent festivals would be members of the horticultural trade, and be elected from those whose contribution-boxes yielded the best results.
- 25. Stewards (Horticultural) would be elected by the general council in recognition of special services rendered, preference being given to gardeners.
- 26. Refreshments.—The refreshment department would be let out to some well-known first-class caterer by yearly contract.
- 27. Music.—Musical arrangement would be made with the executive; only those of the highest class would be considered.
- 28. Picture Galleries.—The picture gallery would be rented, and every facility given by the staff for the sale of pictures and statuary at a fixed percentage.
- 29. Exhibition of Appliances.—This department would be under the control of the executive; space being charged for, and assistance given to further the interests of inventors and manufacturers at a fixed percentage.

- 30. Horticultural Papers be solicited to open their columns for donations.
- 31. Echibitions.—As far as possible there should be a continuous series of exhibitions, high-class concerts, conversaziones, lectures, debates, &c., so as to fully utilise the premises.
- 32. Royal Courts.—The patronage of Her Majesty to be solicited.
- 32x. Loan Collections.—Six courts being reserved upon ground floor (shown in section lines upon ground-floor plant for the reception of a Loan Collection if members of the Royal Family should be pleased to entrust one to the Institute.
- 33. City Courts.—Thirteen or more courts should be reserved upon the ground floor for the City companies, who would be asked to furnish them with exhibits illustrative of their several trades; or these courts might be let to leading manufactures, or others—every facility being given to them for furthering their business. These courts, it is estimated, would let at an annual rental of £50 each,
- 34. Hospital Courts.—Certain courts should be appropriated by the City charities at a reduced rental, donation boxes being placed in each.
- 35. Charity: Three Days' Festival.—Apart from its expository uses as an exhibition hall for everything pertaining to horticulture, metropolitan, and other trades and charities, the Institute would be further dedicated to the cause of charity, as periodically special efforts would be made to augment the funds of the Gardeners' Benevolent and Orphan Societies, a three days' festival being organized every year for this purpose.
- 36. Sale of Work: Children's Help. The co-operation of everyone would be invited, lady secretaries being appointed to further the work amongst children by interesting them in plants and flowers, and by encouraging them to make articles for the sale of work held at the festival. Anyone sending goods of the value of 2s. 6d. to the festival for this sale of work should be admitted free on each day.
- 37. Distribution of Flowers and Fruit after Shows,
 All flowers and fruit sent for exhibition should be distributed by the lady secreturies at the close of each show amongst the metropolitan charities. Exhibitors be specially asked to consent to this as far as possible in aid of the suffering and poor.
- 38. National Festivals.—On St. Andrew's, St. Patrick's, and St. Divid's days respectively, special concerts might be given, and as far as possible exhibitions be held representative of Scotland, Ireland, and Wales. On the occasion of grand concerts all the courts would be concealed by drapery, red curtains being drawn across the front of each.
- 39. Railway Arrangements would be made with the railway companies for special trains at reduced rates, so as to afford facilities for our country friends to visit the metropolis, and at the same time to help the funds of the charities by contributing to the appeals which would be made to them during the three days of the feetival.

Having briefly outlined the formation, establishment, and maintenance of the Institute, it now remains to put the project "upon its mettle," and as it is imperative that action should be taken at once—and someone must take the initiative—I propose to wait upon certain representative gentlemen and submit the scheme to them, and in doing so, I am propared to find that some of my proposals may require to be more or less modified.

The main points 1 firmly believe are attainable, and 1 look with great confidence to the results of the Victoria Rose and other floral festivals held simultaneously all over the land as giving expression to the nation's loyalty to our Queen, and show its love of horticulture.

Here is an opportunity for everyone, from the cottager to the nobleman, to give expressions of fidelity to our beloved Queen. Such a gift would find a welcome in the heart of the greatest living mother.

That considerable organisation is involved is obvious, but no work of such magnitude was

ever accomplished without it—" United we stand, divided we fall." If we sink every other consideration and join hand in hand, the Horticultural Institute will surely be founded.

Horticulture has advanced and prospered during her reign, and how could her children more expressively "rise up and call her blessed" than by establishing a permanent Home for Horticulture in grateful memory of her glorious reign. James L. Wood, Onkleigh Park, Whatstone.

P.S.—I purpose dealing further with the financial aspect of the scheme at an early date, probably in your next issue. J. L. W.

HOME CORRESPONDENCE.

FLAVOUR IN APPLES AND PEARS.-It seems a pity that the competitions for the prizes so generously offered by Messrs. Veitch and Sons, carried on at each of the Drill Hall meetings, should be narrowing down so appreciably that just about three gardoners keep the competitions alive. Of late the contention has been between Messrs. Woodward, Herrin, and Wythes chiefly, and if these fell out, they may eollapse. So far, interesting as these classes have been, they have revealed nothing. Early Apples gave little of merit so far as flavour is concerned, but when Cox's Orange Pippin and Ribston Pippin came on to the scene, then they monopolised the prizes for several meetings. It is noteworthy, however, that Cox's Orange Pippin seems usually to be rather better than Ribston Pippiu, and without doubt it is our premier Apple for flavour, having also good appear-ance, and soft, smooth-eating flesh. But the competitor who has won a prize with a variety cannot take the same prize with it again; hence, if the competitors do not change or increase, both these fine Apples will be presently excluded from the competition. Having so far proved themselves so good, no doubt that is enough. But what will follow? We have yet to be tested later varieties, and it is in connection with these most of interest should be found. There is Searlet Nonpareil, Winter Pearmain, Court Pendu l'lat, Cockle Pippiu, Brownlees, and Aromatic Russets, Sturmer Pippiu, and others to follow, but so far there has been no new or revealed variety, neither does there seem to be any late one unknown or in reserve that is not already well known. I fear at the time when the prize-list expires next year, we shall have to say that we know only just so much in relation to flavour in Apples as we knew before. If there be gardeners or amateurs anywhere who have varieties not hitherto known or recognised as of good flavour, especially if they be good keepers, now is their time to send them along to the Drill-hall, and let them be fairly and freely tested. It is worthy of note that, in connection with these competitions, the appointed tisting committee have their decisions more severely and practically discussed than is the case, probably, anywhere else. Pears seem to be in very much the same boat as Apples. Doyenné du Comice has proved itself so far to be the finestflavoured Pear, but then we all knew it previously. Beurré d'Anjou, Marie Louise, Thompson's, and a few others have proved to be fairly good, but the first-named is much the best. Pear competition for flavour is fast narrowing down to but two or three of any merit. So far, Seckel and Winter Nelis have made little show. Presently we may see Ne Plus Meuris and Glout Morceau presented, and perhaps Easter Beurré ; but unknown good flavoured keeping varieties seem to be looked for in vain. If any have such, they would be cordially welcomed. No doubt had the prizes been open to competition by trade we should have seen those who doubtless hold yet the best new varieties of Apples and Pears, that is, if there be such, sending them along; though there is the possibility that the doing so might have but exposed lack of quality, and thus have discounted the prospects of the variety at once. But if they have some good new things, it seems as if no harm would be done in sending samples along for trial, even if they may not take prizes. We want to know which are the best, let who will have them. A. D. Nov.

WASTE OF VALUABLE FERTILISERS.—Judging from its chemical composition, it would appear that the ash from wood and coal must be of very great value as a fertiliser, and that many thousands of tons are annually wasted. I am unable to find any reliable data as to the practical value, or the kind of land and crops this waste is suited for, and if the subject has been dealt with by any expert, I should

be very ploased to get all possible information. The fine ash, cleared from cinders, should be well worth collecting. We have recently commenced to use the waste wood from our local country whoelwright as a fuel, instead of coal, and have kept all the ash as a fertiliser; but, having no experience to guide us, it is desirable that we should know what has been done, and what is known on the subject, and as the ash from coal is practically the same as from wood, the matter is one worthy of serious consideration. Thus, Fletcher, Grappenhall, Cheshire.

CLEARING LAND OF COUCH-GRASS.—E. Cadman. whose enquiry regarding this matter I noticed in a recent issue of the Gardeners' Chronicle, should not employ piece-work to clear his ground of Couchgrass, as it will only end in disappointment. If daywork can be afforded, it is certainly better, trenching the ground about 2 feet deep, and picking out by hand every particle of Couch-root. Another method which I have found suitable for clearing Couch from large tracts of land, and which I have found to answer very well, is to plough the land very deeply, then work it with a large grubber, afterwards harrowing it with the ordinary small-tined barrow, finally chain-barrowing it, and gathering all the rubbish together, and burning it in small heaps on the land. If repeated after frost, E. Cadman will find the last method cheap, and very succe-sful. Heavily manure the land after clearing, if it should stand in need of this, and is not too soft to carry the carts. J. D. Robertson.

-- To elear land of Couch grass, in answer to Mr. E. Cadman, the best and cheapest method is to turn it up with a 12-inch broadsheare point at once, if not too wet, and leave it "brock" until March; then, if it sets in dry, harrow it on the cross, and burn in small heaps, or cart away. Afterwards broadshearing again the other way, and harrow it and collect the roots, &c. After you have got it clean, plough it, and put in Swedes, with some artificial mannre, then feed off with sheep, and put in Barley. you will then very likely have some good malting Barley! the Swede, during summer, will have to be set out and hoed two or three times, which will all be in favour of cleaning. If you have no sheep of you own, take some in to keep on the condition that they are fed with chalf and corn, which will be to the benefit of the land. If the land is wet, wait for dry weather before you begin operations, and always let it be dry work, otherwise the cleaning will be badly done. Wm. Lewis, East Sutton Park, Stapleharst,

PEAR HUYSHE'S VICTORIA.—Referring to Mr. Miller's comment and question on p. 729 of Gardener's Chroniche of the 12th inst., we have here a young fan-trained tree on a south wall, from which I gathered fruits at the end of last October, these being almost ripe at that time, the earliness of our fruit being due, probably, to the warmth of the situation. The variety has all of the good qualities mentioned by Mr. Miller, is a middle-sized fruit, well worthy of general cultivation. Doyenné d'Iliver is another good variety here, coming in at the present season, and on that account very acceptable. It is a larger fruit, with a melting flesh. tr. F., West Park, Salisbury.

—— I agree with that which Mr. Miller says in the Gardeners' Chronicle, at p. 729, regarding the goodness and usefulness of this variety in the present month. It is one of the best Pears that we have, being satisfactory from pyramid-trees, and from a tree trained on a west wall, the fruit from the latter being finer, and the flavour superior. As Mr. Miller remarks, it requires to be left on the trees as long as possible, otherwise it will shrivel after gathering. The soil of the garden at Poltimore is heavy and wet, therefore cold: and many other varieties of Pears crack, but Huyshe's Victoria never does. As most of our readers will be aware, it originated in Devonshire with the Rev. J. Huyshe, of Clyst-Hydon, a place only a few miles distant from here. T. H. Shade, Poltimore Gardens.

— In answer to Mr. W. Miller's question, I may say that we have a tree of this variety on a south-west wall here, whose roots are beneath a plot of turf. Its age is about eighteen years. This tree is horizontal trained, healthy, showing a nice lot of fruit-buds, and having the appearance of not being in need of root-pruniog to make it fruitful, and yet for the past five years it has not produced six fruits a-year. The tree was at one time shaded a little, but last season I removed this shade, and every alternate branch has also been removed, to enable the

wood to ripen. I think so little of it, that it is not included amongst the young trees that have been planted here recently. Glou Morceau is a variety that does well in these gardens, and some large and eld trees of the variety are trained against high south-east walls. It is one of our most useful late varieties, and one that keeps till January. Pears of all varieties this year are ripening fully two weeks earlier than usual. John Lambert, Powis Castle Gardens.

THE FRUITING OF LAPAGERIA ROSEA.—There is nothing unusual in this, as the Editor justly remarked in the Gurdener's Chronicle of Doc. 5. We have several plants on the roof of the orangery at this place, and I have noticed more or fewer seed-pods every year. In fact I have raised several plants from the seeds, and have some planted out, but they are not large or old enough to flower. I have noticed the occurrence in other gardens, but so far I have not observed the white variety bearing seed, and assume that it is of rarer occurrence. I counted to-day, Doc. 1, ten seed-pods on one of our plants. J. Magne, Bieton, Deron.

- Some nine or ten years since, we had very vigorous plants of L. rosea superba and L. alba, each of which produced several fruits without the aid of artificial fertilisation. as my memory serves me, the fruit did not as my memory serves me, the fruit and not arrive at mutarity the same year in which the flower was fertilised, but in the following one When the fruit was quite rips, a quantity of seed was taken out and sown. Nearly every seed germi nated, and in a very short time, considering its somewhat hard nature, with the result that a number of strong healthy plants were produced that made rapid growth. Several of them flowered when they were from four to five years old. The flowers were larger and more highly coloured than the forms of L. rosea that have come under my observation, but none of them was equal to the parent. I was most interested in discovering whether the plants raised from seed of L alba would produce white flowers, because it is looked upon as being merely a form of L rosea or a sport from that variety; and my experience goes to prove the correctness of that view, as all of the seedlings from L. alba, which tlowered while under my care, produced rose-coloured flowers. It would be interesting and instructive to have the history of the parentage of L. alba, which is said to have been introduced from Chili in the year 1854. Lapageria is probably the handsomest, and for decorative purposes one of the most useful of cool climbers; a free and vigorous grower under suitable conditions, and its cultivation does not present any difficulty to an experienced gardener, and yet it is frequently to be met with in anything but a healthy condition, W. Neild, Cheshire.

Having read the articles in the Gardeners Chronicle regarding fruiting of this plant, and the raising of plants from seed, I wish to record my experience with it. I may say that I lived at Porter's Park in 1853 and 1854, and knew the plant referred to by your correspondent "M.D." in the issue of the Gardeners' Chronicle for December 5, but I do not remember seeing any fruits on it, or many flowers. The plant was, however, exhibited at Kew when in flower in the latter year. In 1856 I received two plants from Messrs. Veitch & Sons of Chelsea, which I planted against the back wall of the conservatory here. They grew vigorously and flowered abundantly, the stronger shoots being perfect wreaths of flowers, and we obtained dozens of fine pods of seeds, which, when ripe, became yellowishgreen, and may have contained 100 seeds each. These seeds have the appearance of small grains of Wheat, and they germinated quite freely. One of the plants did not produce such fine flowers as the other, nor did any of my seedlings come up to the best plant. I planted one ont-of-doors which stood one winter, but did not grow much afterwards. think the Lapageria is a plant which does not like much sunshine. John Barnett, Deker Hill, Shifnal.

— It is pretty well known to gardeners that Lapagerias frequently bear seeds under cultivation. We have here a good plant of L. rose and L. r. albatone on each side of a portion of a span-roofed conservatory, and both plants produce ripe seeds every year. Would the seed be at all likely to produce flowers of various tints? [Yes, flowers with slight variations from the type, and probably inferior flowers. Ed.] I send for your inspection what I consider a very prolific growth cut from the L. alba growing here. It is 10 inches long, with twelve fully-developed flowers thereon. Jas. Horaley. Hestington Gurdens.

--- It may interest many to know that L. roson was sent to the Royal Gardens at Kew in 1847 by R. Wheelwright, Esq., an American gentleman, who had been instrumental in establishing steam navigation in the Pacific, and incidentally improving the means of transport to this country. The year following, Mr. Thomas Lobb introduced it for Messrs. Veitch & Son from Chili. It was named in compliment to Josephine Lapagèrie, wife of Napoleon Bonaparte, who rendered great service to botany. About 1854, Mr. Richard Pearce introduced alba from the same country for Messrs. Veitch & Son. but I believe a plant was sent to the Jardin des Plantes at Paris by M. Abadi before that which was figured in the Botanwal Maya in 1856; the red one had been previously figured, viz., in 1849. Lapagerias, both white and red, have fruited in many gardens to my knowledge, and I have seen hundreds of seedlings raised from and ripened in this country. The process of raising plants is however very slow, and it is much more convenient to raise them from layers. Some three years ago both the red and white varieties growing in the Botanical Gardens, Birmingham, produced dozens of fruits, and Mr. Latham was enabled to raise numerous seedlings; as did also Mr. Nicholas at Ashe Gardens, some of which had distinct pale rose-coloured flowers. One of the largest, and also the deepest coloured varieties that I know of, is the Nash Court variety, which was purchased from the Victoria and Paradise Nurseries, Upper Holloway, many years ago as the rosea variety, and which is now growing luxuriantly in the conservatory at Nash Court, Faversham, under the care of the gardener, Mr. Humphrey. I have also seen the plants mentioned by Mr. Burbidge at Straffan House, which are grand I have also seen the plants mentioned examples of cultivation. A. Outram, F.R.H.S.

GROS COLMAN GRAPES (see p. 728).— In 1893, I exhibited at the Birmingham Chrysanthemum show, three bunches of this variety, the largest being a little over 6. Ib. It is not unusual for berries on vigorous Vines to average 1½ inches in circumference. For the last sixteen years these Vines have carried an average of 38 lb. each. It would be interesting to know how long this variety lasts in market establishments where large weights are taken annually. John Bates, Stone. | The communication was accompanied by a Photograph showing three fine bunches of this Grape. En |

CEDRUS DEODARA. - I see in your pages a discassion as to the merits of Cedrus Deodara. glad to hear of its growing so finely at Wortley, but it does not do so generally in Yorkshire; and the notion that it would have made a profitable plantation, even there, is quite a mist ken one. The Cedar of Lebanon, and still more so, the Mount Atlas Cedar, are both of them hardier and healthier in most places than the Deodar, but they have never been planted successfully in woods, or produced in England timber of any value, although, like the Deodar, on their own mountains, the timber is valuable. Forty or fifty years ago, the East India Company imported into England several tons of Deodar seed. thinking that so valuable and hardy a timber-tree ought to be planted extensively in England. I have never heard that any valuable timber has been the result of that importation, and I never expected that any such would be the result. I think that it would be very difficult to grow any of the Cedars successfully in plantations; and there is no evidence that even if they were so grown successfully, the timber would be worth anything, and it is my belief that it would have very little, if any, value—certainly nothing like as much as that of Larch, or even of Scotch Fir or Spruce. C. H. Strickland.

—— As a proof of the hardiness and adaptability to exposed situations, twenty years ago we planted several groups of these in a portion of New Park, four and five being put in each group in a very high position, exposed to the north and north-east winds, which comes across the Chantry Hills with force sufficient to cut their heads off. Notwithstanding this supposed drawback, they are thriving amazingly, whilst others which had been planted in sheltered nooks have been cut out on account of their sickly growth. I consider that these species might be more extensively planted in parks than is the case. At Peper Harow Park, Surrey, large numbers of them may be seen in the woods, of great age and size, thus showing that they will thrive under forest treatment. W. Wiles, Unsteel Park, Galabaling.

VEGETATION IN CORNWALL.—As showing the effect of the mild weather in Cornwall, there are plants in flower in our garden of Sweet Alyssum,

double-flowered Pyrethrums, Mignonette (very full), Candytuft, Chrysanthemum frutescens, Limnanthes Douglasii, Antirrhimums, white Daisy, Veronica variegata, Primroses, and Campanula cæspitosa. The common Snowdrop is peeping through the soil. J. Macers, Maracian, Dec. 14, 1896.

PEAR NOUVELLE FULVIE. - This is a very excellent Pear at the present season, although I fear it is one that is not much known. I find that it is mentioned in several catalogues as b-ing an excellent variety. The fact, perhaps, that it is of rather poor appearance may account for its not being much grown I have had two or three dozen fruits of it this year, and when I say that it ranks next to Doyenné du Comice, readers of this note will perceive that this means a great deal. It is a much better Pear than Passe Colmar, which it greatly resembles, but is larger, and of better flavour. The fruits but is larger, and of better flavour. require much thinning, and liberal treatment afforded the tree, and a place against a wall. The fruits should be allowed to hang on the trees as long as possible, otherwise they shrivel. Writing of Pears, I think it would be interesting to your readers if Mr. Divers, of Belvoir Castle Gardens, would kindly give a few particulars of that excellent Pear that he exhibited for flavour, and took a 1st prize with against Winter Nelis and Josephine de Malines. I was very nuch surprised to see these two beaten for flavour, but having tasted all three, I can speak of the superior flavour of the Belvoir Pear, tree. Howlated, Barham Court Gurdens.

GLASSHOUSE CROPS IN GUERNSEY. — The writer of your article on the "Glasshouse Crops in Guernsey," must evidently have obtained his information or rather, I should say, a portion of it from some unreliable source. Though not hailing from that island, I am perfectly cognisant of the Guernsey system of culture, and know well that Tomates are not grown in the primitive, haphazard manner therein described. On the other hand, the leading growers pay great attention to the saving of seed and do not delay till December; but fruits for the purpose are specially chosen during the summer months, shape of fruit and habit of plant being duly taken into consideration. Secondly, the seed is not put into the soil of a greenhouse a few inches deep, but is carefully sown in seed-pans or boxes, which at that season are placed on bottom heat. The seedlings, when showing two or three rough leaves, are pricked off into other boxes; and in many establishments, when the plants are trong enough, they are carefully lifted and potted in 4 or 5-inch pots, so as to get them of extra strength before being planted out or placed in their fruiting pots (10-inch), as the case may be. Pot culture is the system adopted for early work as for example, when fruit is required early in the month of April. As to the statement that "the growth of Grapes is remarkable, and is becoming more and more popular every year," I am sorry more and more popular every year," I am sorry indeed to have cause to refute this, the very opposite being the case, as the Grape trade, owing to the steady decline in price during the past few years, is fast on the wane, and in fact, is done for, so far as the Channel I-lands are concerned. Vines are being rooted up to make way for the better paying Tomato crop. very price quoted in the article in question tells its own tale, as 3d, to 4d, for Hamburghs, and 5d, to 6d. for Alicantes in September are not paying ones, for bear in mind these prices are those realised by the sidesman, and such as carriage, commission, and other incidental charges have to be deducted; so much so, that the price as received by the grower is a totally different one. Tomatos at 3d. and 3d. per pound pay infinitely better, as the second errop is ready in September, the first crop having been cleared by the first week in June. It is rare, by any system of renewal, that the plants bear a second crop. Carriago for Tomatos is very much less than for Grapes—omething like one-half, which is an item of consideration. Many Guernsey growers do not even find the Tomato crop satisfactorily profitable, and why 'They will stick to the Old Red—though, be it aid, for an early crop it is still useful, setting as it does more freely in the early season; but for a mid and late season crop, better shape must be had if anything like a price is to be obtained. Like everything else in these days, the crops must be heavy, and the fruit of first quality, for cultivation to be remunegative. This latter the Guernsey grower is beginning to realise. P. P. Le Suour, Jersey.

COMPARATIVELY TENDER SPECIES OF SHRUBS IN SCOTCH GARDENS. -Seeing your leading article de cribing the mild climate that seems to exist

round the residence of the Earl of Annesley, co. Down, Ireland, I would like to draw attention to the West of Scotland, and to the sear of H. J. Yonnger, Esq., Benmore, Argyllshire. Need I state that many of the shrubs mentioned to be at Castlewellan can be found growing in rugged health in this favoured spot. But not so much as to them, as a few are of recent introduction there to my knowledge, but to a much hardier class much could be said in praise of, namely, the fine specimens of Picea that are to be found in the picture of health. Few places, indeed, in Scotland can boast of such a fine collection of ernamental woods; and the stranger who pays his first visit in the month of May or early summer, will surely find a treat in store, and to the lover of this class of wood needless to say he will find much to interest him for a day. J. Murray, travden r, Auchinevuire, Ayrshire.

MR. W. G. HEAO, -Many gardeners and others will doubtless have received a circular during the last few days containing the sad intelligence that our friend Mr. W. G. Head, of the Crystal Palace Gardens, is dangerously ill with a most painful malady; and it is proposed to collect a sum of money in order to assist in paying the heavy surgical and other charges attendant on such severe cases as his, but it is not possible to reach all by circulars. Mr. Head is well known to a great number of the visitors and exhibitors at the Crystal Palace shows, and as a manager of shows; and I may venture to say that as such he is without an equal. But I will base my plea on higher grounds than this, and ask all to come to the assistance of a friend and brother in distress, as now is the time to help and cheer him in his long and painful illness, and that is best done by sending our mite at once to the Hon. Secretary, Mr. John Laing, Forest Hill Nurseries, London, S.E., or to the Hon. Treasurer, Mr. R. J. Veitch, Royal Exotic Nurseries, Chelsea. W. H. Dicers, Belvoir Castle Gardens, Granthum. [We trust that such help as can be given will be as freely accorded as it is sorely needed. Ed.]

A NEW HYBRID LAVATERA.—Allow me to inform your readers of a hybrid Malvacea which grew spontaneously this year in my garden, and is of some interest. This plant is a fine bush, about 60 inches high; the first flowers appeared in July, and the last were only stopped by the frost in December. It is most likely the result of a cross between Lavatera maritima and L. trimestris, both cultivated in the neighbourhood, the pollen originating from the former. Of L. maritima, the hybrid has the glaucous, velvety leaves, the flower largely opened and flattened. Of L. trimestris, it has the calyx and bractcoles of the involucee, and the colour of the petals. The ovules seemed well formed, but no seed ripened. I have got some cuttings, and if the plant prove really hardy, it may be worth while to introduce it in gardens. M. Wicheli, Geneva.

LAW NOTES.

THE BUSHEL-BASKET CASE.

We learn, after all, that the question of trade custom involved in the "Bushel-basket" case, wherein the Brentford justices decided that market gardeners must sell market produce by denominated weight and measure, and not by local or reputed measures, such as "sieves" or "local bushels," will not come on for argument. The justices, as will be remembered, consented to state a case for the opinion of the Queen's Bench Division. The solicitor for the defendant, Mr. Reffell, drew up a case, in which he made points that the purchaser selected one par ticular basket out of several, and that he particularly indicated the basket he took in the expression -"How much are them baskets!" To this statement the solicitor for the County Council, Sir Richard Nicholson, could not agree, declaring that nothing of the kind was stated in evidence. In view of this disagreement upon the facts to be set out, the solicitor for the defendant has intimated to the Court that it will be impossible to go further,

SHREWSBURY NURSERYMEN AND THE AGRICULTURAL RATING ACT.

A special Sessions was held at the Shrewsbury Police Court on Tuesday for hearing appeals under

the Agricultural Rating Act. The Mayor (Alderman E. C. Peele) presided, and the other magistrates present were - Major-General the Hon, W. H. Herbert, Messrs. J. Cock, J. Evan Jones, and G. Evans. Four appeals were down for hearing in respect to Shrewsbury nurserymen, viz., Messrs. Pritchard & Sons, Mr. E. Murrell, Mr. Myers, and Messrs, Jones & Sons. The appeals were made on behalf of Mr. Kitton, Surveyor of Taxes, against the decision of the Assessment Committee of the Atcham Union in confirming the statements of the overseers in reference to the rating of certain market gardens and nurseries in the occupation of the persons mentioned, in the Atcham Union, the ground of appeal being that the hereditaments had been wrongly entered as agricultural land, thus securing the partial relief of the

ratal under the new Rating Act. Mr. Everest opened the case, and from his state. ment it appears that the contention of the surveyor of taxes was that market gardens were divisible into two proporties—buildings and land. On the other hand, the Assessment Committee contended that market gardens for the purposes of the new Act were not divisible, but one whole, and the point involved was whether land covered with glass (greenhouses) was market garden land. The new Rating Act provided that occupiers of agricultural land should be liable in the case of every rate to which the Act applied to pay one-half only of the rate in the pound payable in respect of buildings and other hereditaments. Agricultural land meant any land used as arable, meadow, or pasture-ground only, cottage gardens exceeding one quarter of an acre, market gardens, nursery grounds, orchards, or allotments; but did not include land occupied together with a house as a park, gardens, other than those described, pleasure grounds, or any land kept or preserved mainly or exclusively for the purposes of sport or recreation, or land used as a racecourse. He sn1 . mitted that so far as market gardens and nursery grounds were concerned the effect of the clause was that they were included in the words agricultural land in the orders of the Local Government Board, and in reading that Act it was correct to say when the words "Agricultural land" occurred, also including gardens or nursery grounds. Mr. Everest cited the ease "Purser v. Worthing Local Board," decided in the Court of Appeal in 1887, where the appollant, a market gardener and nurseryman, was the occupier of a piece of land upon which were built sixteen greenhouses, or glass-houses, which practically covered the surface of the land. They were built on brick foundations, and were used by the appellant for the purpose of growing fruit and vegetables for sale in the course of his business. The case was decided under the Public Health Act. In giving judgment for the appellant Mr. Justice Day said, "This ground ought to be assessed at one fourth of its net annual value; it is used for gardening, that is, for the production of fruit and vegetables on a more or less small scale, as distinguished from a gricultural use on a large scale; and in my judgment at is a market garden Mr. Justice Wills said he was of the same opinion, and remarked : "In arriving at our decision we should look at the state of things which was in existence before the Act was passed. There were then market gardens and nursery grounds all over the country, and in the majority of them a very large and substantial portion was covered by glasshouses. Cardening operations were carried on in them, and the cultivation of hothouse and greenhouse plants is no less essential a part of these operations than the cultivation of plants which grow in the open air. These are places where operations in the nature of gurdens are going on, and these houses are parts, and necessarily so, of them. I think that such pieces of ground are very properly included under the head of market-gardens or mursery-grounds." Then when the case was taken to the Court of Appeal, Lord Esher, Master of the Rolls, said :-- "I am of opinion that

the judgment of the Queen's Bench Division must be

affirmed. There can be no doubt that the respondent

used the whole of this plot of land as a market-

garden-for the purpose of growing fruits and vege-

tables for sale. I think that the land is not the less used as a market-garden because these glasshouses have been placed upon it." Mr. Everest contended that the Public Health Act and the new Riting Act were both relieving Acts; therefore, what applied to the one, would apply with equal force to the other.

After hearing arguments from Mr. Williams, Mr. Bowdler, and Mr. Lethen, the Mayor said the magistrates were quite unanimous in their decision. They felt bound by the case quoted, and must dismiss the appeal. If they had been guided by their own judgment the result would have been the same. Shrewsbury Chronicle, December 11.

DECISIONS IN COMMERCIAL LAW.

The Niagara District Fruit-gravers' Association v. H'alker.-An agent was engaged by the plaintiffs from year to year for four years to sell fruit on their behalf on commission, one of the terms of the engagement being that all moneys received by him on behalf of the plaintiffs should be paid in from day to day to their credit in a named bank. The agent made default in this respect, and a large balance was due by him to the plaintiffs at the end of each of the first three years, and the plaintiffs at the end of each year took his note for the amount due, payable in the next year. In each year he gave a bond to the plaintiffs to secure the faithful performance of his duties, and the prompt payment of moneys received The defendants were the surcties in the bond given in the fourth and previous years, and entered into the centract of suretyship without making any enquiries from the plaintiffs. This action was brought against them to recover the balance due. A Divisional Court decided that the plaintiff's should have informed the sureties of the previous defaults and not having done so could not enforce the bond Monetary Times, Toronto.

CLAIM BY MESSRS, CARTER & Co.

Disputed Liability .-- In the Westminster County Court on Monday, his Honour, Judge Lumley Smith Q.C., had before him the case of Carter v. Webb & Co., in which the plaintiffs, Messrs, Carter & Co. o. High Holborn, sucd defendant to recover paymen of an account in respect of a quantity of seeds supplied to him whilst carrying on the business of a nursery. man at Newington Green Road. Plaintiffs' representative said the goods were supplied to Webb & Co., with whom they had done business for some years, and the defendant was the only person they looked to for payment. The defendant was called, and said he never ordered the goods in question, and as a matt r of fact he had left the business prior to the time when they were supplied. He disposed of the concern to Messrs. Edwards & Co., but the old name was still

The present owner of the business said it was he who ordered the goods, and he was perfectly willing to pay for them.

His Honour told him that the sponer he did so the better, but as the thing stood at present, he (the Judge), should give judgment against the present defendant with costs.

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 15. - The list inceting of the Committees for the present year was held in the Drill Hall, James Street, Westminster, on Tuesday last, and was a fitting close to the very successful series of meetings that have taken place since the close of last year. Orchids made a good display, and secured several Botanical and other Certificates. Berried plants were not present in great quantity, but the few exhibited included some capital plants of Skimmia Fortunei, There was a group of pot Roses which bore numerous ere my white flowers; and Poinsettias were shown well. Two perpetual flowered Carnations were recommended Awards of Merit; and, although the date was a late one, a s'milar distinction was granted to a Chrysanthemum. A fine group of Cyclimens was exhibited, which included plants from English and from German seed. Fruit was by Lo means scarce, there being several very commendable collections present,

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messes, Jno. Friser, H. B. May, H. Herbst, R. Dean, Robert Owen, Geo. Stevens, J.s. Hudson, Geo. Nicholson, W. Bain, Thos. Peed, J. D. Pawle, C. E. Shea, J. W. Burr, H. Turner, H. Cannell, Geo. Paul, J. T. Bennett-Por, Chas. Jeffries, R. M. Hogg. Geo, Gordon, Ed. Beckett, and Jno. Luing.

From Messrs, II Cannell & Sons, Swanley, was shown a collection of sprays of zonal Pelargonium blooms in variety; some of these are exceeding bright in colour, and of large size-King of Crimsons, Jno. Ruskin (searlet), Zenobia (salmon-rose), Princess Alex (pink), Lord Newton, and Sher-(Admon-rose), Princess Arex (pink), Lord Aewich, and one-lock Holmes (both purple-crimson), A. F. Wootten white and pale red), Soldier's Tunic (very bright scarlet), and Snowdrop (white), represent some of the best. Double Primulas were likewise shown well by Messrs. Canneti, the varieties Earl of Beaconsfield (pink), Marchioness of Exeter (white), King of Purples, and Annie Hillier being represented by well-flowered plants (Silver-gilt Banksian Medal).

Mr. Tins, S. Ware, Hale Farm Nurseries, Tottenham, London, showed a few Bulbocodiums in flower in pans, Ins

London, showed a few Bulbocodiums in flower in pans, Itis Vartani, also Iris alata, Saintpaulia ionantha, S. i. colestis, pub blue, and S. i. rubra, reddish purple. A large plant of Hellehore was extremely well flowered (Vote of Thanks).

A group of Rose-trees in pots, of the variety Euchantress, was exhibited by Messrs, WM PAUL & SOS, Waltham Cross Nurseries, Herts. It is described as a winter blooming and bedding variety, being a hybrid between a China and a Teascented Rose. The plants were very freely flowered, and the bloom was very roles of the second of the plants which inspire to white Csilver. scented Rise. The plants were very freely flowered, and the blooms were very pide electry blush, passing to white (Silver Flora Medal).

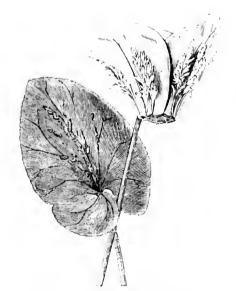

FIG. 138 A CRESTED CACLAMES. See Report of Royal Horticultural Society - Floral Committee -- Mossrs Lows exhibit.)

An exhibit of a seasonable character was a group of Orangetrees (Citrus sinensis) and plants of Skinunia Fortunei, shown by Messrs Wu. Cetrush & Sex, Highgate Nurseries, London, N.—The Orange-trees were in 6-inch pots, and were London, N. The Grange-trees were in 6-inch pots, and were well fruited. In similar pots the Skimmias bore a profusion their well known descrative berries (Silver Banksian Medal).

A circular group of plants of Euphorbia pulcherrima (Poin-settia), shown by Mr. W. Farr, gr. to A. Pears, Esq., Spring Grove House, Isleworth, was remarkable for the good culture evidenced. The plants possessed plenty of healthy foliage, and the bracts were large and good in colour (Silver Flora

The only exhibit of Cyclamens was one from Messrs. Hugu Low & C.). Rush Hill Park, Enfield. This included a bitch of plants representing a cupit of English strain, and others were from seed obtained last season from Germany. The latter were decidedly inferior in most respects to those we Latter were decidedly interfor in most respects to those we are accustomed to see. Some of the white varieties, however, possessed a little performe, a quality that is almost host in our English strains. A white-flowered variety bound Bush Hell Propeer had singular flowers. From the exterior of each petal was produced a fan like crest, as in fig. 13s.
Another plant, Majestic, h of flowers possessed of ten petals in place of the usual five (Silver Binksian Modd).
A group of small plants of Crotons was shown by Mrs.
WISGFIELD, Ampthill House, Herts (gr., Mr. Empson). These

were of good colour; and in addition to a few misocllaneous plants, there was a very well flowered specimen of Lolia anceps Silver Binksian Medal).

Messis J.No. Peed & Sovs, Roupell Park Norsevies, Norsevies,

wood Road, London, S.E., exhibited a group of fine foliage plants consisting principally of well grown Cordylines Dracenes), &c. (Bronze Banksian Medal).

Messrs. Laing & Sons, Forest Hill, London, S.E., exhibited Messrs. Laing & Sons, Forest Init, London, S.E., exhibited, a few well grown fine foliage plants, as Dracana Lindeni, Livistonia rotundifolia, Abutilon Souvenir de Bonn, a pretty varie, ated kind; and Dracana Doucetti. There were well-berried plants of Solanum capsicastrum, &c.

Messrs, Young & Dourson, Stevenage Nurscries, Herts.

Messrs, Young & Dhanson, Stevenage Nurseries, Herts, made a display with Chrysanthemnin blooms, a large number of these being shown (Bronze Banksian Medal).

Mr. W. Wells, Earlswood Nurseries, Redhill, exhibited a collection of Chrysanthemum blooms, many varieties being in very commendable condition for such a date (Bronze Banksian Medal). A number of Chrysanthemum blooms was also contributed by Mr. R. Owen, Castle Hill Nurseries, Maidenhead. No awards, however, were taken by any Chrysanthemum at this meeting, except by the variety Christmas Gold, blooms of which were shown by Mr. P. Christinas Gold, blooms of which were shown by Sit. F. Lards. Swanley, Kent. It is a fairly large incurving Japanese; colour, bright golden-yellow. An incurved Chry-anthemum, named E. Midford Thompson, was shown by C. F. Thomson, Esq., Penhill Close, Llandaff, Cardiff. A plant be ring four blooms was shown; they are yellow and bronze in colour.

Mr. W. J. Godfrey, Exmouth Nurseries, exhibited three

blooms of H. W. Reeman, a very large yellow Japanese Chrysanthemum.

Messrs. Chare & Claura, March, Cambs, exhibited several varieties of tree Carnations: Deutsche Brant (white), Madame D. Albertina, with very fine pink flower of large size, and W. Robinson. This last-named variety, to which an Award of Merit was recommended is a pretty crimson flower, compact, and of good form. The grass and the habit of the plant being very satisfactory.

Mr J. Douglas, Edenside Nurseries, Bookham, also exhibited several perpetual or wintering-flowering Carnaconfided severa perpetual or wintering-movering carnations. To one of these an Award of Merit was recommended, being Julian, a very dark velvety-crimson flower, large, but a trifle dull. Winter Bride was the name of a perpetual flowering Carnation, blooms of which were shown by Mr. Jenkins, Humpton Hill, Middlesey. The flowers are large and white, apparently an excellent variety for cutting

Messes, Javas Veiren & Sons, (Exotic Mursery, Chelsea, displayed sprays of a number of varieties of their Javanicoposininiforum hybrid Rhododendrous, all of which are pretty, and some extremely beautiful. An Award of Merit pretty, and some extremely occurrent. A favoration state was recommended to Rhododendron nobilities, a plant of which, bearing a fine truss of bloom, was shown. This is the which, bearing a fine truss of bloom, was shown. This is the result of a cross between R. Teysmanni A. R. javanicum. Flic flowers are large, of a pretty yellow colour; anthers purple, and some of the flowers slightly stained with same colour. R. - Little Beauty obtained a similar award. This plant bore smaller flowers, pale rel in colour.

Sit Thevoir Lawrence, Bart., Burford, Dorking (gr., Mr. Bain), again exhibited spathes of numerous varieties of hybrid Anthurioms, many of them being very attractive; also a few plants in flower of Primula obcomes grandiflora. Silver Flora Medal).

Silver Flora Medal).

Orchid Committee.

Primat Harry J. Veitch, Esq. (in the Clear); and Messrs J. ((Brien Hon, Sec.), Baron Schroder, Dr. M. T. Masters, J. Gurney Fowler, C. Winn, Major Mason, T. Statter, E. Hill, J. Douglas, S. Conrtadd, H. Ballanti e, De B. Crawshay, R. Brannan-White, Fred. Hardy, E. Ashworth, T. W. Bond, W. H. White, H. J. Chapman, W. H. Protheroe, C. J. Lucas, and T. R. Harryman. and T. B. Haywood.

For the list meeting in the year a very fine show of Orchids was made, in which the winter-flowering Calanthes formed

an important element.

The largest and brightest group was sent by Sir Trevor LAVIRENCE, Bart., the President of the Royal Horticultural 8 ciety (gr., Mr. W. H. White, and for it a well merited Gold Medal was awarded. The group consisted of an amalgama-tion of two specially interesting selections of Orchids, the from or two specially interesting schedulis, and Orlands, the one half consisting of the famed Burford hybrid Cdunthes, and the other of rare species, and hybrid Orchids of other classes. Among the Calanthes, a number of C. × Burfor itensis were prominent as the darkest and brightest in the darkest and brightest of the consistency of commine-crimson; C. × Veitchi splendens, rather lighter in a dour; C. × Veitchi ketta, clear white; C. × Veitchi ketta, clear white; C. × Veitchi a flegina, a soft pule pink; C. × revertens, a new tint of carminewhite flower with yellow eye. Among them also were C. & Bryan and C. & Wm. Mucray, both first raised by Mr.

In the other portion of the group were Cypripedium < Lawrabel, t. .

Conco-Lawre, C. > Fascinator, and other fine hybrid Cypripedium; a good specimen with many spikes of Lelia Muriottiana, an ally of L. furforacea and L. autumn dis, leat distinct from either; an elegant plant of Platyclinis ungafa (Batanical Cortificate); Masdevallia Veitchi grandidora, still one of the finest Masdevallias, and singularly enough one of the survivors of the first importation made by Messrs. of the survivors of the first importation made by Messis. Verten, out of which only fourteen plants survived the journey; M. « Henriette, M. polysticta, M. pa hyura, and the alhed M. tridens both very pretty; the graceful, white, fragrant Bulbophyllum auricomum (Botanical Certificate); a fine specimen of Maxillaria lepidota, with a large number of dowers (Cultural Commendation); Zygopetalum Burkei, Cycnoches maculatum; a very pretty hybrid of Challes Achillarias, but of humanical purentian. Cattleya Schilleriana, but of unrecorded parentage. vola venosa (Botanical Certificate), and numerous other nteresting things.

Messes, J. Veitch & Sons, Royal Exotic Nursery, King's Boad, Chelsea, showed a very remarkable group of hybrid Orchids, together with some species. The great attraction was Lello-Cattleya & Rosalind, which was generally voted second only, from all points, to the admitted best hybrid of the year recently shown by Messrs, Veirch-viz, Lello-Cattleya & Decia.dba, L.-C. & Rosalind (L.-C. & Dominii & C. Trianei & is remarkable in many ways, and especially on account of its male parent, L.-C. & Dominii L. purparata & Dominii being still an unique example in Baron Schroder's collection, although raised many years ago. L.-C. & Rosalind, in the size and form of its flower, equals one of the very best type of C. Trianei. The sepals are cream-white, the broad petals white with a flush of pa'e rose-pink, except on the margin which is pure white. The showy lip is well-rounded, at the base rich yellow with radiating white veining running into the rich rose-purple front; the side lobes being light-purple veined and bordered with white—a very handsome flower (First-class Certificate). Another fine new hybrid was L.-C. - Semiranis (L. Perini & C. & skelliana &), with pale lilae sepals and rich plum-coloured front to the lip; and also in the group remarkable were Epidendrum - Endressio-Wallisii, E. - elegantulum; the brilliant Epiphronitis - Veitchi; Cypripedium - Tityus (Spicerianum - enanthum superbum), a very dark and richly coloured form; C. Euryale, many varieties of C. Lecanum, C. T. B. Haywood, C. Zeno, C. Arthurianum, C. Niole, C. - Sallieri, C. - Genone, L. elia - Stella, Cymbidium cyperifolium, Sclenipedium Boissierianum, &c. The group secured a Silver Flora Medal.

E. Ashworff, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. Holbrook), showed the pure white Lelia pumila dlba var. E. Ashworth, described in Guadages' Chronecle, October 10, 1896, and received a First-class Certificate for that charming albino. Also Cypripedium insigne giganteum, a noble variety which was also exhibited by Major Mason, The Firs, Warwick.

Baron Sir II. Schroder, The Dell, Egham (gr., Mr. II. Ballantine), staged a small group of fine cut blooms of Orchids, among which were the very handsome and richly-spotted Odontoglossum erispum Schroderianum, the fine white Ledia anceps Schroderiana; L. a. Stella, L. a. Amesiana, L. a. Chamberlainiana, L. a. Protherocana, Cypripedium insigne Sanderianum, C. a. Galatea, C. a. Lecamum superbum, &c. (Vote of Thanks).

J. T. Benneit, Poe. Esq., Holmewood, Cheshunt (gr., Mr. Downes), was awarded a Silver Flora Medal for a very bright group, consisting of excellently cultivated Orchids. Amongst them were noted a fine example of a very dark blue-coloured variety of Vanda corulea, some good examples of Chanthe & Veitch, C. vestita luteo-oculata, and C. V. rubro-oculata, with many spikes to each plant; also fine Lælia autumnalis, L. pumila, Zygopetalum Mackaii, with many stout spikes; Cypoinedum insigne Chantioi Improved, a good advance on the old form; and a fine hybrid Cypripodum of unrecorded parentage, with very large flowers of the light hue seen in C. > Chas. Canham.

Messers, F. Sander & Co., St. Albans, staged a good group in which were the greenish Cypripedium - Dauthieri albina, Cypripedium - Saturn (villosum - Lecanum Masercelianum); C. - Lady Wimborne (villosum & Lecanum giganteum); C. - Mons, Elysee Descombes, C. - Aleties, C. & Lynchianum, C. - Adrastus, C. & Leander, and varieties of C. & Lecanum; also Trichopilla brevis, a remarkably pretty species; bedia autumnalis alba, L. A. delicata, L. Gouldiana; Cattleya choecensis, Downside variety, white with a small purple spot on the lip. C. Percivaliana amouna, a fine pan of Dendrobium Johnsoni; D. sanguinolentum, Physicalanthe, Amoldie, Cymbidium & Wimnimum, and Anguecum polystachys (Vote of Thanks).

Messrs Huen Low & Co. Clapton, arranged agroup consisting of Cypripedium > Lecanum superbum, Low's var., a pretty and richly-tinted, though not large form, and other varieties of C. × Lecanum. Also C. insigne Dormanianum, Calanthe Veitchi alba, varieties of Lelia anceps, Cypripedium & Arthurianum, C. Harristanum superbum, Cattleya Bowringiana, Oncidium Krameri, &c. (Vote of Thanks).

Major Jorcey, Sunningdale Park, Sunningdale (gr., Mr. Fred, J. Thorne), showed two well-grown and finely-flowered plants of bendrobium Johnsonie.

F. C. J. Comb, Esq., Cheam Park, Cheam (gr. Mr. Turner, showed Odontoglossum - Andersonianum bencochibum, a pretty variety, in which the peculiar feature is the mispotted lip. J. W. Temple, Esq., Leyswood, Groombridge gr. Mr. Bristow), showed Ladia anceps Amesiana. G. Shiriland Ball, Esq., Ashford, Wilmslow, Cheshire (gr., Mr. A. Hey), showed Cypripedina Lecanum magnificum, which has a dorsal sepal measuring more than three inches across; and C. Swinburnia magnificum. Thos. Stating Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed cypripedium - Lucienianum superbaim, C. × Annamense, and C. - Roberti.

Messrs. Hevill & Son, Cheltenham, sent a spike of Zygopetalum & oldained by crossing Z. Mackaii with an Odonto-Jossum. Z. Mackaii is noted for preserving its individuality in a great degree in seedlings obtained by hybridisation, and in this case there was little evidence of a cross having been effected, the flower being exactly Z. Mackaii so far as the sepals and petals are concerned. The lip, however, showed some evidence of change, it being slight ywavy, and pure white with slight purple-coloured marks at the base and centre S.G. Lauweng, Esq., Beckenham gr., Mr. Paterson, showed hybrid Cypurpediums. H. B. Beausanx, Esq., Thorn Leigh, Burton, Westmoreland, showed Cattleya labiata and three voneties of Cypripedium, of which a yellow third C. insigne was the most remarkable. J. Branshaw, Esq., The Grunge, Southgate gr., Mr. Whiffen, showed a group of Odontoglossma. Cymbidium.

Charlesworthi, &c. M. Otto Froebel, Zurich, sent cut blooms of Cymbidium giganteum, Odontoglossum a Coradinei, and Cypripedium × Leeanum multi-punctatum. F. W. Moore, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent Maxillaria setigera.

Fruit Committee.

Present: Philip Crowley, Esp., chairman; and Messus, T. Francis Rivers, Geo. Bunyard, Jos. Cheal, P. C. M. Veitch, G. W. Cummins, A. F. Barron, W. Pope, A. H. Pearson, J. Wright, Alex. Dean, Jno, A. Luing, Chas. Ross, W. Farr, Ch. Herrin, J. W. Bates, Geo. Wythes, F. Q. Line, H. Balderson, Jas. Smith, G. Reynolds, G. H. Suge, G. Norman, Robt. Fife, and J. Willard.

From Lockinge Gardens, Wantage, the establishment of Lord Wantage (gr., Mr. Fyfe), was exhibited a collection of sixty dishes of Apples, and four dishes of Pears—Most of the varieties exhibited were of first rate quality, and especially creditable being an anateur's productions; but these were in some instances incorrectly named. Some excellent fruits of Dwarf Champion Tomatos were from the same garden, and five good bunches of Museat of Alexandria Grapes in a well preserved condition (Silver Banksian Medal).

A magnificent exhibit of Apples was contributed by Messis, T. Rivers & Sox, Sawbridgeworth. Upwards of fifty dishes of fine fruits were included in the collection, which embraced both culinary and dessert varieties. A few of the brightest and best looking were the following:—St. Martins, Lame's Prince Albert, King of Tomkins County, King of the Pippins, Sandringham, Cox's Orange Pippin, Mamington Pearmain, Feurn's Popun, Bryon, Washington, Blenheim Orange, Gascoigne's Searlet Seedling, and some large specimens of Emperor Alexander Silver Knightian Medal).

Messrs, JNO LVING & SONS, Forest Hill Nurseries, London, S.E., staged an exhibit of nearly fifty varieties of Apples, including some of the very best of existing varieties (Salver Banksian Medal).

In the competition for the best-flavoured dishes of Apples and Pears there was again a very satisfactory competition. The best Pear was Winter Nelis, shown by Col. Beymen M.P., Ilsington House, Dorchester gr., Mr. J. Powell). The fruit was taken from a tree grown on the Pear stock, m light soil on chalk on a wall with west aspect. Glou Morecau won 2nd poize for Mr. W. Cotterrick. The Gardens, Oxon Hoath Park, Tonbridge. These were also from trees upon the Pear stock, against wall with west aspect, but planted in heavy Ionn. Cox's Orange Pippin was the best Apple, and the fruits were gathered from six-year-old pyramids upon Paradise Stock; trees were planted in an exposed situation, upon a southern slope, in shallow boun on linestone. The exhibitor was J. Coleman, Esq., Gatton Park (gr., Mr. W. King). Col. Brymer took 2nd prize, with a dish of fine fruits of Bleinheim Orange Pippin, from orchard standards in light soil on chalk. Mr. J. Smith, gr. to Lord Roslepin, at Mentmore, exhibited a bunch each of Grapes, Lady Hutt, and Appley Towers. These new Grapes were both good in quality and had been well grown (Cultural Commendation).

From Frogmere, Mr. OWLN THOMAS exhibited some hadmand fruits of Tomato, Frogmere Selected, which went to prove the variety's adapt delity for winter fruiting. A quantity of fruits of Farr's All the Year-Round Tomato was shown by Mr. FAR, Spring Grove House Guidens, Isleworth, Although the fruits are small, this variety is a very useful one for continuous cropping. Cultural Commendation. Mosses, You'so, & Bornsson, Stevenage, had fruits of their Tomato Young's Eclipse. Mr. W. J. Empson, gr. to Mrs. Wisoffeldo, Ampthill, showed Capsieum fruits of the variety Codin is Manumoth.

Mr. A. Dean exhibited a very light and useful box for the

Mr. A. DEAN exhibited a very light and useful box for the winter storing of Siged Potatos, similar to those used by the Surrey County Council. They cost about suspence each, hold 12 lb, to 14 lb, of tubers, and are capable of being placed one upon another.

one upon another.

The Secretary of the BECKENHAM HORTCULTI BAL SOCIETY exhibited a number of paper trays and dishes which that Society use for displaying fruit, &c., at exhibitions. They are enempted but four shillings and sixpence per hundred. If they were made a little stronger they would be more useful.

A new Pear exhibited by Mr. W. Allan, Gunton Park, and named President Baralie, was declared to be promising, and it is probable that an Award of Merit would have been recommended had there been six fruits exhibited instead of three.

EDINBURGH BOTANICAL.

December 10. The above Society met at 5, St. Andrew Square, Edinburgh, on the above date, Dr. A. P. Aliken, President, in the chair, Mr. J. A. Terras, B.Sc., gave an interesting communication, entitled "Some Azerophytic Adaptations"(*), and illustrated his paper by some fine slides of succulent plants, &c. In the meteerological notes from the Boyal Botanic Gurdens, Mr. A. D. Richardson gave the following items for November. Barometer readings, highest, 30°555 on the 25th; lowest, 29°625 on the 14th. Mean of month, 30°045, being 9.288 above the average. Shade temperatures, highest, 53°2 on the 22nd; lowest, 24°5 on the 50th. Frost occurred on five days. Hygrometer Mean of dry bulb, 40°2". Radiation thermometers: highest in sun, \$6°25°, on the 3°d; lowest on grass, 12°15°, on the 30th. Frost occurred on the grass on fourteen days. Sunshine: Total for month, 22°6 hours

Sunniest day on the 3rd, with 6.5 hours; lifteen sunless days occurred. Total rainfall for month was 0.530 inch, greatest fall for one day being 0.110 inch, on the 6th. Rain fell on thirteen days.

Mr. R. J. Harrow gave the usual notes on plants in the plant houses, after which the meeting concluded.

TAUNTON FLOWER SHOW: ANNUAL MEETING.

DECEMBER 8.—The annual meeting of the members of the Taunton Horticultural and Floricultural Society was held at the Guildhall on Tuesday evening. The Mayor (Alderman Lock) presided.

Mr. Clements presented the balance-sheet, which showed that the receipts were £334 10s. and included £17 19s. 24. balance from last year, and £425 18s. 3d. gate receipts, the latter being a record. As a result of the show, they had a balance in hand of £80 19s. 4d.

THE POTATO TERCENTENARY.

DECEMBER 9. - The conference, inaugurated by the hish Gardeners' Association, and the opening of which was briefly notice I in our issue for Dec. 12, was formally opened by the president-Mr. A. O. WATKINS-with the delivery of an address, in which he explained the aims and objects of the association, and made special reference to the fact that the committee had recently decided to establish a Gardeners' Benevolent Fund for Ireland. The proceeds of the conference would be devoted to the starting of this fund, and it had also been decided to make an appeal to the generous public for subscrip tions or donations in aid thereof. In support of this appeal, Mr. Watkins said: - "A gardener is just as much a victim to the ills and misfortunes of life as the rest of mankind. He has to work from early morning till late at night in all weathers, and is subject to heat and cold more, perhaps, than is experienced by those following any other cilling or profession; and, what is worst of all, in the majority of cases he enjoys but a poor remuneration, and, as a rule, has a large family to support; struggling on year by year, unable to save anything for his old age or the vicissitudes of life. I therefore hope we may be successful in obtaining a good round sura, to be securely invested, and its interest to be applied as follows:-1. For the relief of members during sickness. 2. For insuring money to be paid on the death of a member, or for funeral expenses on the death of a member's wife, 3. To assist members when in distressed circumstances. J. To provide a pension for old age."

Lord Powerscourt .- On the motion of the President, the chair was then taken by Lord Powerscourr who, in the course of an instructive address, said. We are met here to-day to celebrate the fact that three hundred years have clapsed since Queen Elizabeth's great courtier, Sir Watter Raleigh, conferred upon Europe perhaps two of the greatest benefits that we know of. It is a curious thing that this island has been the theatre of so many occurrences which have in ide great marks upon the world. Here is a proof, among others, that Ireland is fitted, with her mild elimate and fertile soil, for the production of many things of great use, if that soil is properly cultivated. I am afraid we have not sufficient heat here for the production of fine tobacco, but a coarse kind has lately been grown with some measure of success. I understand that it is contemplated to try a vineyard in the south of Ireland - I do not see why it to try a vineyard in the south of ream — (no not see why it is not worth trying. Since Sir Walter Raleigh's time the Potato has become specially the food of the Irish people. There is, I think it will be conceded, no esculent in general use to compare with the Potato, except the Onion, and what a combination these two make—an Irish stew! That is a dish which, whether as an article of food or a question of politics, we are tolerably familiar with. We are not concerned with politics here, but with Sir Walter Raleigh's great gift to The Potato has had many vicissitudes, and the crop has been subject to failure from causes which I will advert to presently, and which have in Ireland, in former years, resulted in national calamity. That was not the fault of the Potato, but mainly the fault of ignorant cultivation, combined with occurrence of inclement seasons in 1847 and 1848. These were ruinous seasons, and there was no means of communication through the country. The same conditions are occurring now in India. In districts where railways and telegraphs are provided, relief can easily be afforded, and 1 believe that such a famine as occurred in Ireland in those years would now be quite impossible, as relief would always be near, and besides, there are many organisations which were totally absent in those days, that would prevent the possibility of such an occurrence. With careful cultivation and saving the crop early it might never occur in these days. No m in, woman, or child nowadays is content with the midday or evening meal unless Potatos form part of it. Whether it is the poor man, who consumes his frugal meal, or the epicure, whose table is laden with dishes, there will never be found a table where the Potato is not part of its garnishing, and it is capable of being cocked in more different ways than any other regetable. I am old enough to remember the time of the famine in 1847-18, when as a child I recollect being told that we were not to cat Potatos, but to keep them and give them to the poor. There was a sort of bread made from Potatos in those days, mixed with flour or Indian meal to eke out

the failing crop. Thank God, those days can never return. In our unions the schoolmasters are generally agriculturists as well, as also in the national schools, and the young idea is taught in those places how to farm and cultivate the Potato among other things. These agricultural teachings fostered by the State, are of incalculable benefit, as making the children, to some extent at all events, less dependent and helpless in these matters than was formerly the case. They go out into the world, whether to the farms where they were horn, or perhaps to some foreign country, with an amount of useful knowledge which makes them able to make their way wherever their lot may be cast. They are taught. which was not the case in the famine years, that it is fatal to the Potato, as to any other crop, to cultivate it for years in succession on the same patch of ground and from This practice, neverticless, prevails to a great extent still, I fear, among the small farmers and labourers; but if they do this they have only themselves to blame for the failure of the erop, with this knowledge imparted to them freely in the schools. The Government do their part; it is for the people schools. The coveriment to their part, it is in the people themselves to do the rest. Another practice which is, I am afraid, still very e-mmon is to let the Potatos lie in the ground long after they are ripe. I have seen on small farms and labourers' plots often that the Potatos are only dug day by day as required for consumption at the moment. But the most important thing to prevent disease is to spray the Potetos. Since this new system has been introduced it has been tos. Since this new system has been introduced it has been proved to be the greatest possible preventive of disease. I had my Potatos sprayed this year twice, and there was practically no disease in them at all. As to my own Potatos, I find that the champion still holds the field the Potato field against all others; but the Beauty of Bute, Antrin, and others also do well. I imported this year from England a variety called Stourh idge Glory. It is a kidney Potato, and holes well. There not yet had an omeochamby of testing and looks well. I have not yet had an opportunity of testing it, but it had a good reputation on the Earl of Dartmouth s firm near Wolverhampton. Lady Calogan give me some seed of a curious garden Potato, a specimen of which is in this exhibition. It is called Batatas Verosa, is a very good catable Potato, and is imported, I believe, from France.

Mr. W. Cotten then read his paper on "The Past. Present, and Future of the Potato." The present is with us, and we are once more, as it were, at the parting of the ways. The Champion, like all its progenitors, is getting worn out in the service, and all good judges agree that we require something to replace it. Many varieties are spoken of and recommended; but I regret to say that so far I can see nothing to take up the place of the Champon as the poor man's Potato. Such varieties of Beauty of Bute, Magnum Bonum, The Bruce, Cp-to Date, &c., &c., produce satisfac-tory results when cultivated under certain conditions as to soil, climate, &c. The Champion in its day produced great crops-1 was going to say without soil or climate; but, any way, under the worst possible conditions. Will any of the varieties now to the forc produce, under equally varied circumstances, results at all equal to the Champion (1) doubt it very much. The man who produces the first Potato to come up to the Champion will be the friend and benefactor of his kind. I take it our main duty here will be to compare notes, and from this conference I carnestly hope something practical may spring, resulting in lasting advantage to Potato-growers. Now, given good, sound seed Potatos, good and generous cultivation, the scientist has placed within our reach the means to, shall I say effectually, combat the Potato disease. Many, no doubt, think this is chimerical. I am fairly observant. I have had large experience in Potato growing, and I am confide t I say no more than what is true, that with an intelligent use of the material and appliances for dressing Potatos we may in time succeed in completely combating the ravages of the Potato disease.

Talking about Potato disease, let me give you an illustration. Thanks to the courtesy and kindness of the superintendent of the Model Farm at Glasnevin, Mr. Clune, I followed closely the treatment of the Potatos there this past season. One large plot especially was an object of great intorest; alternately a number of drills were dressed, and an equal number side by side left without dressing. This was continued over the whole plot. When the disease made its appearance the undressed Potatos were at once attacked, and long after every vestige of the foliage was destroyed by the disease, the sprayed or dressed Potatos were green and growing, clearly proving the value of the dressing. I, for one, at least have no doubt but with a long pull, and a strong pull, and a pull all together that we will finally free our Potatos from disease.

Now for the future. I want to emphasise an idea that for years has been pa sing in my mind. We grow in Ireland annually between \$800,000 and \$900,000 acres of Potatos, and putting the average at \$\sqrt{5}\$ tons to the acre, we get a gross tomage of \$7,000,000 tons. Just think of the labour involved in raising and storing this huge bulk of stuff. But of 75 per cent, of water, you would have a tomage of something over 1,750,000 tons to remove. The Potato, divorced from this 75 per cent, of water, gives a flour that is equally valuable as Whe it in its leading food constituents, and more valuable in others. Now, for illustration sake, we will assume that our population is \$5,000,000, and that for each man, woman, and child we allow, say, hill a pound of this Potato flour for each person daily; we get 187½ lbs, per head of our population as the annual requirement, or about 437,000 tons as the quuntity required for one year's supply, leaving us with a three years' supply in hind, and leaving us with 900,000 acres of

land for other crops during the ensuing three years. I hold that no one should cat Potatos more than once daily, and that meal should be accompanied with a good ration of meat and other vegetables. The labour and expense involved in the annual growth of 900,000 acres of Potates is something immense, and the cost very heavy; it can hardly be less than between six and seven millions of money. The heedless way in which the crop is wasted is something fearful to contemplate. Fully one-half the Potatos, from a food point of view, are lost; consequently three to three-and-a-half millions of money, if not much more, is wasted upon the crop annually. According to my plan, one quarter the land will raise all we require in the way of Potatos; three-fourths of the land will remain for other crops; and a vast amount of labour would be saved to the people, which, devoted to other farming works, will tend to largely increase the wealth of the country, as well as having land and labour to produce cereals to take the place of Potatos in our domestic economy. With the money and labour saved from the great waste, large mills, with drying and other nachmery for the preparation of the Potatos floor, could be erected, where, at a small cost, the people could send their Potatos to be dried. If any surplus was left over, markets could be found in Africa, India, all frequest countries, and in the very cold parts of the world, where Potatos are looked upon almost as a priceless luxury. I my self-have sold preserved Potatos to go to the Fraser River and Alaskan Territories, &c., at is high as £32 to £34 per ton. On this principle a family of four would consume about 28 cwt. of Potatos. ninus 21 cwt, of water, in twelve months, reduced to Potato-flour this would give 7 cwt, which would be contained in 5 barrels, such as we got our American flour in years are. Some will say the Petatos would be spoiled. Nothing of the sort, only the water would be evaporated; and as soon as you had added 84 lbs, of water to 28 lbs, Potatos you got the article mats pristing excellence again. To show the waste in Potatos; in November the farma produced from 240 lb, was as to 45, the following May 28 to 20 fully a loss of 40 per cent, of the food value; and as soon as the period of growth fully sets in the Potato loses all food value, the starch and saccbarine being turned into water. The process of universally drying Potatos may prove worthy the attention of those who are interested in laying by a large food supply to meet eventuals interested in laying by a gage food supply to meet eventual-ties in case of war. It will be niged that our people are not prepared to adopt a new plan of this kind. I admit it; but in dealing with the future of the Potato it is within the scope of this meeting to consider it rather in an entirely new aspect, and let us hope that cre the arrival of the second tercentenary of this very excellent esculent the Irish housewife will be well instructed in domestic and household economy and the husband wift be instructed in the newer and more sencitible method of treating his crops; and that working hand in hand, a happier state of things for all concerned in ty be the result, is the warmest wish, as no doubt it is of yours, of the writer of this paper,

Professor Johnson then read an exhaustive paper on "Potatos and Potato Products"

In the Potato plant, especially as cultivated, the excess of starch and of proteids passes down in a soluble form from the leaves through the aerial stem by the veins into the underground stems or tubers not the roots), there to be stored up for the plant's own subsequent use. The Potat tuber, though an underground stem, as being a storchouse of food matter—very little woody tissue—it is mainly composed of thin walled cells, filled with starch for the most part. The more mealy a Potato is the greater is the amount of starch in it. Towards the surface of the tuter the cells contain less starch, and show a relatively larger amount of proteid matter stored up. At the surface the tuber is protected by a more or less thick, impervious coat of corky tissue. Being a stem, it is not surprising to find that the tuber has here and there on its surface bads, or dormant shoots, the well known eyes. the plant point of view the tuber is an admirable provision for the formation of new Potato plants-for what is called vegetative reproduction. In this connection I may refer to the question of the kind of "set" to be planted. M. Guard, probably the leading scientific authority on the cultivation of the Potato plant, made experiments in the years 1891, 1892, and 1893, and his results are summarised in the Journal of the Board of Agriculture for December, 1894 M. Girard's experiments led him to conclude; 1. The maximum crop is obtained by planting entire tubers of medium weight (3) ozs.). 2. The crop is dumnished about 30 per cent, it such (1) ozs. t. 2. The crop is animismed about so per cent, it such tubers are cut into two portions. 3. The crop is diminished, with rare exceptions, about 20 per cent, by planting cut seed weighing 3½ ozs. from whole tubers weighing 7 ozs. or 10½ ozs. 4. If two or three small tubers, weighing in all 3 ozs , are planted together, the crop is on the average from 5 to 10 per cent, less than that obtained by planting whole tubers of medium weight. Of the different systems of planting tested, in the case of five different varieties (Richter's Imperator, Athens, Blue Giant, Idaho, Gelbe Rose) in the experiments recorded above the most effective is undoubtedly that of planting entire tubers of medium weight—that is to say, of about 3! ozs for those varieties which yield large crops. This is the method which M. Gerard recommends should always be adopted, if possible, by the cultionary and should always be adopted, if possible, by the cultions and should always be adopted, if possible, by the cultions and should always be adopted, if possible, by the cultions and should always be adopted, if possible, by the cultions and should always be adopted, if possible, by the cultions and should be adopted as a specific production of the second of the cultions and should be adopted as a specific production of the cultions and the cultions are should be adopted as a specific production of the cultions are should be adopted as a specific produ tivator, although almost equally satisfactory results may be obtained by the next best method, which consists in planting together two tubers of about half the medium weight, or It, instead of such two tubers veighing about 1} ozs, each. three very small ones are placed together, a smaller yield is obtained. The planting of cut seed should, in M. Girard's opinion, be regarded as a last resource, since it always

results in a reduction of the normal yield by 20 to 30 per cent. During dry years especially the results of cutting tubers may prove disastrons. In 1995, some of M Girard's co-workers who adopted this method lost the whole of their crop, and the following example is given as a case in point.

In 1893 M. Girard planted balt an acre of Blue Grant Potatos. With the intention of showing the fallacy of the announcement of a well-known agriculturist, that magnificent results could be obtained by planting cut fuhers of this variety, a strip 4½ yards wide and 65 yards long, was planted in the middle of the half-acre piece with shees of large tubers cut into four pieces in the approved manner. Of 789 plants set in this manner only thirty-eight grew, yielding a crop of only 113 cwts, per acre; the yield of the rest of the field, which had been planted with entire tubers of medium size, being 10% tons per acre. When reading the report of the evidence given before the Financial Relation. Commission I was surprised at the low average yield which Dr. Grunshaw, the Registrar General (Q. 2806), gives for Ireland- 31 tons per acre. This is, I and, very nearly the same as the average for the whole of the United Kingdom - 34 tons per acre (a little more than 1) million tons for a little less than 14 million acres), though in Germany the yield is nearly 45 tons per agre. On asking a Potato-grower and merchant in South Yorkshire what was regarded as an average yield per acre in his district, he fold me the average. on his farm was above 10 tons an acre; that 7 to 8 tons per acre of Giants or of Bruce was the average in North Notts, Lincolnshite, and South Yorkshite. He mentioned two cases where ⁶ Findlay's Up to Late ⁷ yielded above 20 tons per acre. We may, I think, take it that the German of I ton per acre is not wholly due to advantages of climate and natural fertility of the soil. As bearing on this of I for per acre is not wholly due to advantages of climate and natural tertility of the soil. As bearing on this question of the yield per acre, I may quote the following paragraph from 8r J. H. Gilbert's report on the "Growth of Potatos at Rothamsted, 1888". "For Ireland the estimates show an average yield per acre of less than Ftons, against more than 6 fons in Great Britain. It may be mentioned that the yield per acre given for Incland, where the Potato is still of great importance as a supply of food for the people, is less than twice as much as was diffirmed at Rothamsted, over twelve years in succession on the same land, without any manure; it is scarcely more than was obtained by inneral manner alone, and considerably less than two-thirds as much as was yielded by inneral and introgenous manures together. It is clear, then fore, that the condition of the land, the cultivation, and the treatment of the crop are in Ireland much interior to those in the rest of the United

What, we may ask, is the value of the Potato, looked at from an economic point of view? What is its value as an article of food for man and beist? Chemical analysis long ago showed that in 100 ports by weight of a Potato tuber, " parts are water, 25 parts are dry matter, of which about 20 are chiefly strich. Only 1 part is immedal matter, of which To is phosphate 25 introgenous, 355 potash, and the lime is very little. Thus, three-quarters of a Potato is water, less than a quarter is starch, and only one hundredth part consists of in-trates, phosphates, and time substances so absolutely essential in the formation of brain, flesh, and bone. Man is often com-pared to an engue, if any work, expending energy, and as a precedent necessity, consuming a certain amount of fuel. An average man loses daily (in 24 hours) six pounds of water, about half a pound (4,000 grams) of earlion, about half an ounce (300 grams) of introden, and marer an omice (400 grams) of inneral grains) of introgen, and heaver an onnee (19) grains) of numeral matter. These losses must be made good if man is to carry on his work. It is well known that different articles of food con-tain the necessary elements in different proportions, and that a mixed diet, consisting of bread, milk, flesh, fish, towl, Potatos, butter, water, we, is considered the best for main. As man must have 500 grains of introgen in his food daily, Potatos alone are a very unsuitable article of food. To get this introgen he must eat 14 pointls of Potato a most unnecessary and wasteful operation, involving an enormous amount of absorption and more or less complete digestion of unneeded starch, &c.—The more nearly the Potato the less the amount of introgen in it, the more watery the Potato (condi-tions of cooking, &c., being the same) the more introgen it contains. The mealy Potato, the prize-taker at an agricultural show is the Pot do for the rich man; the watery, the one for the poor man, if he cannot afford to buy his mixed diet, at interest to note that as the introgen containing material is more stored near the surface, the custom of this country of cooking the Potatos in their skins is justifiable on economical grounds alone. Tack Potato peelings carry away nearly all the introgen compounds to be found in a Potato. Two pounds of bread and three-quarters of a pound of meat are equal to 10 to 12 pounds of Polato, and need much less digestion. we cat, or should cat, simply to give ourselves the energy necessary for the performance of our daily dufies, it is of great importance that our digestive apparatus should not be called upon to do unnecessary work

The Petate crop is one of the heaviest starch producing crops, nearly the whole of the father coming from the water of the sed and the carbonic acid of the air, two holes hoth abundantly and freely provided by nature. As an article of lood the Potato's piece is in a mixed dict. Other economic uses of the Potato are well summarised in Dr. Kane S. Industrial Resources of Treland, published in 1844.—"It is certain that on the western coest of Indual the humidity of the atmosphere is such as on an average of years may present a scrious obstacle to the appening of Comerops and the sale completion of the haive t; but it is also extain that the tendency to adopt guzzing in preference to fillage agriculture as a pursuit is nuch more connected with the habits of the agreentural classes than with the nature of the

soil or the character of the climate. More industry has been in Ireland, for many generations, connected with the idea of a vulgar and depressed east. The possession of the land with per-f cct idleness constituted in itself the criterion of respectability. These ideas have been already very considerably disturbed. Its vast productiveness has multiplied Potatos in Ireland, so that they form the basis of the subsistence of the entire country. That is an evil, for a social condition where each family, or nearly each individual, has his field, which furnishes his immediate nutriment, without any necessity for marketing, without the assistance of the miller or the baker, without occasion to demand assistance from his neighbours that society is deficient in the elements most necessary to the progress of its civilisation. Of all the starch-bearing plants, the Potato is that which affords the greatest quantity of the Potato is that which allords the greatest quantity of produce from a given surface of land. The different varieties of Potato differ, however, very much, and the following table will indicate exactly the circumstances of the most important kinds. The plants were grown all on the same quality of land, and the analyses are by Payen, the eminent French agricultural chemist :-

	T t		100 parts contained			
Varieties.	Fewt, s	1 state nero produe	Water.	<u> </u>	Gluten and Fibre,	
	cwt,	tons.				
Roban .	58	144	7512	16%	5.2	
Large Yellow	37	14.7	657	2013	5.0	
Scotch	32	8	6975	2231	5.2	
Slow Island	5/5	14	7994	15.2	< ***	
Legonzac	112	5	71/2	20.5	833	
Siberian	4(1	10	77.5	14:0	5-2	
Duvillers	40	10	7843	45.6	8.1	

These results show that the quantity of starch is not largest necessarily in those varieties which yield the greatest weight of tubers. Thus, an arre of large, yellow Potates, which gives but 03 tons of tubers, produces 2 tons 3 cwt. of starch, whilst the acre of Slow Island Potatos, which produces 14 whilst the acre of show shall Polatos which produces 14 tons of tubers, gives only 1 ton 15 cwt, of starch. In cultivating the plant for the purpose of extracting this material, it is, therefore, of the greatest importance to attend to the existence of these varieties. The preparation of starch from the Polato is an operation of very simple kind, and well adapted for the industry of the smaller towns where Potatos would be usually chean, It requires only the most ordinary skill, and involves little machinery—the greatest nicety in it being perfect cleanliness. and care that the washings be well finished, and with pure water. The operations of the manufacture are: 1st, Wash-

water. The operations of the mainfacture are: 1st, Washing the tubers; 2nd, Rasping them to a pulp; 3nd, Pressing the pulp; 4th, Washing the rough starch; 5th, Draining and drying the produce; 6th, Bolting and storing.

It is necessary to add some valuation of the money circumstances of this manufacture. An acre of Potatos, very well manufed and on good land, may be considered to produce time tons of Potatos, which may be taken, as worth £15. From such Potatos it may be expected that, with proper care, 15 per cent, of pure statch may be extracted, and hence, from the time tons, 27 cwt. The market price of the Potato starch is variable; it has been 30s, per cwt., but it only on rare occasions falls below 20s. Taking it at 20s, the value of the produce of the acre becomes £27, leaving for cost of manufacture and profit £12, and of this certainly a large proportion should be profit. I do not think I value the Potatos teacher a of factor of the market profits. portion should be profit. I do not think I value the Potates too low, as, of course, the manufacturer, if not himself the grower, would purchase for store at proper seasons, and avail himself of the lowest terms. But this calculation of advantage supposes the starch to be the only valuable matter extracted from the Potato, which is tart from being the case," "If the residual pulp be properly commissed, it is explent that the cost of growing the Potatos may be materially diminished. The atmosphere in itself furnishes, in fact, the carbonic acid and (indirectly) water from which the starch is formed, and if the matters taken from the soil in each crop be returned to it in the residues of the manufacture, the cost of manure, so heavy for this particular plant, may be almost entirely obviated. In this country, where the extensive use and culture of the Potato have become almost a national characteristic; where labour not requiring considerable skill is to be had so cheap; where Potatos are at their minimum price; it is not merely to be regretted, but absolutely disgraceful to ourselves, that we import from Scotland and from France a large quantity of the Polato starch to be consumed in Ireland." I may mention that of the ten million tons of Polatos animally raised in France, four millions, or nearly one-half, are used in the manufacture of starch and of alcohol. The Germans are investigating the relative starch producing powers of different varieties. Potato starch is used on the continent and in England for many other purposes, not a few of which are of the nature of adulteration. Condensed from the "Trish Farmers

Obituary.

CHARLES PROSPER VAN GEERT. It is with much regret that we have to announce the death at Antwerp, on the 12th inst., of M. Charles Van Geert, in his seventy night wear. M. Van Geert was an in his seventy minth year. M. Van Geert was an eminent nurseryman, well known to many in this country, who a limited his amiable, straightforward character and bright intelligence,

THE WEATHER.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending December 12, is furnished from the Meteorological Office:

"The weather during this period has been very dull.

squally, and rainy, but brief intervals of clear sky occurred at times, especially in the west

"The temperature was a little above the mean over Great Britain, but just equal to it in Ireland. The highest of the Britain, but just equal to it in Ireland. The highest of the maxima were recorded about the iniddle of the week, and ranged from 50° in the "Channel Islands," to 49° in "Scotland, E and W." The lowest of the minima, which were registered on rather irregular dates, varied from 27° in "Ireland, S., and 28° in "England, S.W." and "Scotland, E.," to 33° in "England, N.W.," and to 39° in the "Channel Islands."

"The rainfull exceeded the mean in all districts except Scotland, N ;' in most of the western districts, and in Scotland, E, the excess was considerable.

"The hight sunshine was very little prevalent, but ex-

ceeded the mean in Ireland and in 'England, S.W.' The percentage of the possible amount of duration ranged from 3 in 'Ireland, S.' to 12 in 'England, S.' and to only I in 'Scatland, I.'" Scotland, L.

MARKETS.

COVENT GARDEN, DECEMBER 17.

e cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed. 1

LONDON: Dec. 16. — Messrs, John Shaw & Sons, Seed londons: Dec. to,—Messrs. John Shaw & Sons, Seed Merchants, of Great Maize Pond, Borough, London, S.E., write that to-day's seed market, as might have been expected, presented quite a boliday aspect. Indeed, as is usual at this season, somnolency has now altogether taken possession of Clover and grass-seeds, meanwhile values all round, keep surprisingly firm. Winter Tares being good and cheap, are attracting some speculative attention. Mustard and Rape-seed keep steady. The new American Haricus inst banded are in fair request at the termiting rates. cots just landed, are in fair request at the tempting rates corrent. There is no change in Wisconsin Peas. Scarlet Runner and Canadian Wonder Beans offer at reasonable figures. The bird seed trade presents no fresh feature.

SEEDS.

FRUIT AND VEGETABLES.

Glasdow: December 16.—The following are the averages of the prices current at market during the past week:—Fruit: Pears, 6d per lb.; Apples, 1s. to 2s. per stone; Tematos, Guernsey, 5d. per lb.; do., Scotch, 6fd. do.; Grapes, home, 1s. to 2s. do.; do., foreign, 4d. to 6d. do. Vegetables: Turnips, white, 2s. to 2s. 6d. per dozen bunches; Swedes, 1s. per cwt.; Savoys, 1s. to 1s. 3d. per dozen; Cabbages, 6d. to 3d. do.; do., late, do. 10d. to 1s. 6d. do.; do., Red, 2s. 6d. to 3s. do.; Cauliflowers, Dublin, 2s. to 2s. 6d. per dozen; Parsoips, 4s. 6d. per cwt.; Herbs, assorted, 1d. to 2d. per bunch; Mint, 6d. per bunch; Onions, Dutch, 3s. per hag; do., Globe, 3s. to 3s. 6d. per cwt.; Greers, 4d. per bunch; Celery, table, 1s. to 2s. per bundle; do., commen, 9d. to 1s. do.; Potatos, best, 8d. per stone; Carrots, 2s. 6d. to 4s. 6d. per cwt.; Artichokes, 10s. to 14s. do.; Cucumbers, 4s. 6d. to 6s. per dozen; Lettuees, round, 6d. to 9d. per dozen; GLASGOW: December 16 .- The following are the averages of ber ewit., Arterokes, 10s. to 14s. do.; Cucambers, 4s. to 6s. per dozen; Lettuees, round, 6d. to 9d. per dozen; do., French, 9d. to 1s. do.; do., Cos, 9d. do.; Radishes, 9d. to 1s. per dozen; Horszradish, 2s. to 3s. per bundle; Mushrooms, 1s. to 1s. 3d. per lb.; Beetroot, éd. per doz.; Cress, 3d. per backet; Brussels Sprouts, 1s. 3d. to 1s. 9d. per stone.

LIVERPOOL. December 16 .- Averages of prices current at the following markets —Potatos, 8d, to 10d, per peck; Grapes, English, 2s, to 3s. per pound; do., Foreign, 6d, to 8d, do.; Pines, English, 4s, to 8s. each. North Hay: Turnips, 19s. per ten. Potatos. Imperators, 1s. 8d, to 1s. 10d.; Main Crop. 2s. 3d. to 3s.; Champions, 1s. 8d. to 1s. 10d.; Bruces, 1s. 10d. to 2s. 3d. per cwt.; Turnips, 6d. to 8d. per 12 bunches; Swedes, 1s. to 1s. 4d. per cwt.; Carrots, 6d. to 8d. per 12 bunches; do., 2s. 6d. to 2s. 9d. per cwt; Oni.ns, English, 4s. to 4s. 6d. per cwt.; do., foreign, 2s. 6d. to 3s. 4d. do.; Parsley, 4d. to 6d. per dozen bunches; Cauliflowers, 1s. 6d. to 3s. per dozen; Cabbages, 6d. to 1s. do.; Celery, 8d. to 1s. 4d. per dozen heads.

VARIORUM.

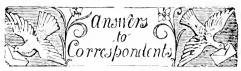

FRUIT CULTURE IN EAST SUFFOLK. - A public meeting was held at Lowestoft Town Hall on Thursday, 25th ult., Councillor C. H. Jacobs, Chairmau of the Technical Instruction Committee, presiding, when the prize essays on the development of Lowestoft and distrit as a centre for fruit culture were read. The e-sayists were Mr. William John Bales, of Wickham Market; and Mr. William Wagstaff, of Beccles, and both contributions were interesting and useful. Councillor R. Leach, who inaugurated the movement, gave a very instructive exposition of what was aimed at by the committee. He believed that much of the fruit consumed in this country might be grown at home. He was strongly of opinion that a great deal of land in this district was particularly well suited to the growth of soft fruit, such as Strawberries, Gooseberries, and black, red, and white Corrants, besides Celery, garden Peas, and other kinds of vegetibles, on account of the great depth and quality of the seil, and its contiguity to water. On hundreds of acres which surrounded the marshes and bordered the rivers he firmly believed that a good crop of the fruits and vegetables he had named might be obtained nearly every year; whereas, on much of the land where such crops were grown in other parts of the country, e-pecially in the case of soft fruits, the grower was compelled to be satisfied with a good crop once in every two or three years. The reason they were so favoured was, that on ground around Lowestoft they were not entirely dependent on the rainfall for a good crop, as water was to be found within 18 inches or 2 feet of the surface; and. besides, the land was rich in quality. Raspberries could be grown in this neighbourhood at a good profit; and, as an example of what could be done by growing Strawberries, he said that a grower of this fruit in the Fen district made £100 per acre of his fruit last year. The consumption of soft fruits could be largely increased. Small grovers might co-operate in the same way that Danish farmers did in making butter and curing bacon. The invalid might, too, be catered for with great advantage by the substitution of saccharin for sugar in the manufacture of jams, jellies, &c. He trusted that if Lowestoft and the district became a centre for fruit culture, the landowners would be willing to help on the movement by accepting fair prices for their land and granting easy terms for payment, as without fixity of tenure, such as ownership alone could give, the movement could not greatly prosper. East Anglian Daily Times.

ENQUIRY.

"He that questioneth much shall learn much."-BACON.

Making Lawns with Torves.—Will some one of experience kindly oblige Enquirer with a few particulars as to the cost per acre of forming gardenlawns with turves—from commons or roadsides, and the difference in expense as against seeding down with the best lawn-grasses? Also as regards the approximate difference in numbers of turves and cost in the laying down of an imperial and Scotch acre? The turves in both cases being the orthodox size, i.e, one yard long, one foot wide, and one inch thick. Also what such turves of good quality could be purchased for per hundred?

Rose and Other Cuttings of Woody Plants, Small Roses, &c.—Will some of our readers kindly afford "R. O." information with regard to the packing of the above for safe transit to Assam?

ARUM CRINITUM: A. H. C. The plant grows in good soil, deeply worked before being planted, and in a warm situation. Propagation is by separation of the tubers.

Aspidistra: G. B. We cannot account for the presence of the small white translucent spots thinly scattered over your leaf. Have you been spraying with chemicals. It may be merely a case of variegation by suppression of the chlorophyll.

AURICULAS AND CALCEOLARIAS UNDER NAME: C. F. B. Scan our advertisement columns; or a lvertise your wants

Books: M. Burker. Mr. Upcott Gill, Becaur Office, 170, Strand, W.C., publishes several small manuals on the subject of Melon and Cucumber culture, at 1s., or less money.

CHENET GROUNDS: A Reader. Mr. Upcott Gill, Bayear Office, 170, Strand. W.C., may have a manual on the subject. The whole matter consists of having a well drained piece of quite level 1md, 80 yards by 80 yards, laid with turves free from weeds and coarse grasses, well beaten and rolled. In winter, it should be manured when this seems needed; and in summer, mowed frequently, and watered when hard with drought.

CURRANT-BUDS DISEASED: Ettrick, Your bushes are attacked by the Currant-bud mite, so often figured and described in our columns. Cut off and burn all the affected shoots so far as you can.

FERNS FROM STORES: C. K. There are a large number of crested Pteris serrula'a grown in market gardens, but yours seems to be the most heavily crested which we have seen; and if it could be raised from spores, it would doubtless be worthy to take its place among the best.

Figure 8 Figure 1. Joddmore. The plint should be kept for the winter in the "South-room," if the temperature at night is not less than 55°, nor higher in the daytime than 65°, in that part of it where the plant stands. Water should be afforded only when the soil indicates considerable dryness, and it should not stand in a saucer, but on a layer of clean gravel placed in an ornamental pot or saucer so that the water does not touch the bottom of the pot in which is the plant. Keep the leaves free from dust. The plant having lately unfolded a leaf, is a proof that growth has been induced by, probably, the application of water. Let the plant rest for the next ten or twelve weeks.

Garden in a Pear Boo: Subscriber,—Wherever the fruit trees and Vines are to be planted, borders of loamy soil, taken from above limestone rock, should be made 3 feet deep, or the same very largely incorporated with the staple. They should be raised in sloping borders of from 15 to 30 feet wide, 1 to 2 feet higher than the surrounding level, and the land should be very well drained before any other work is undertaken, the drains being placed, if it be possible, at a depth of 4 feet. Rubble drains are more suitable than tiles or pipes, which are liable to be choked with roots—especially those of the Vine. Over the rubble lay heather sods face downwards, which will protect the drains for a great many years against the infiltration of the soil. Lime will be found of great use in the new soil, and in all parts of the garden, and may be used as a dressing yearly.

HYACINTHS IN GLASSES: A. B. The water, instead of "half covering the bulbs," should have been one half to a quarter of an inch below them. Throw away those which are rotted, reduce the quantity of water to the above depth, and keep the glasses in a cool, quite dark place till the roots have almost filled the glasses; then expose them to half-light for three days, and after that lapse of time to full light, and always close to the glass. Change the water every three or four weeks, and, if you can get it, use pond or rain-water.

J., Tangute, Wakefield, should send his full name and address, not necessarily for publication, but as a guarantee of good faith.

Mu.hrooms: P. & Sons. It is not uncommon for Mushrooms to be more or less abortive and distorted, for reasons that are quite unknown; so

that neither dealer nor grower can be blamed. We have observed that the distortion is less common in beds spawned out-of-doors.

Names of Fruits: D. R. The fruit, of which you enclose a piece, is one of the Anonas—Custard Apple or Sour Sop. They are of West Indian origin, but your specimen is not sufficient to enable us to give you more definite particulars.—J. W. 3. Beurré Diel; 4, Vicar of Winkfield; 6, Hacon's Incomparable; 7, Shobden Court; Apple: 1, Not known; 2, Rymer's.—D. Newell. Pear: Verulam—Kent & Brydon. Not known.—Biddles & Co. Apple: Beauty of Kent.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number. — S. G. R. 1, Adiantum gracillimum; 2, A. curvatum; 3, A. capillus (veneris variety); 4, A. Waltoni; 5, A. tenerum; 6, A. cuneatum.—Miss II. Campanulas: The specimens were not numbered. We believe the large deep blue cup-shaped specimen to be C. carpatica. hairy one with a spike of pendulous bells is C bar-hata; the one with smooth lanccolate leaves and pale blue flowers is, we think, C. rhomboidalis; and the remaining one is C. persicifolia.—II. B. 1, Oucidium Forbesii; 2, Eupatorium album; 3, Iris fimbriata. — W. J. W. llex dipyrena.—J. B. Lycaste costatu.—£. E. The specimen sent is a leaf, and an inflorescence with bracts and some bads of a species of Eria, of which we can probably give you tho name, if you send an inflorescence with perfect flowers.—Bray Head. 1, Senecio ficoides; 3, Authericum lineare variegatum; 4, Maxillaria picta.—
A. E. M. 1, Pelargonium tomentosum (Penny-Royal scented Crane's Bill); 2, Pelargonium capitatum, variety.—J. O. I, Oneidium Cavendishianum: 2, Calanthe Veitchi; 3, Calanthe vestita luteo-oculata; 4, may be Davallia dissecta, but the soft young froud sent is not a good specimen. The Fern used in packing is Adiantum Pacotti; the "Moss," Selaginella cæsia of gardeus.—T. H. 11'. We do not undertake to name varieties of florists' flowers.

Nursery and Seed Trade Association: W. E. Taly.—Secretary, S. Worrell, 30, Wood Street, Cheapside, London, E.C.

Palms: T. L. Palms used for decoration in dwelling-houses often go in the way indicated in the specimen sent, and it is difficult to assign a cause. Sometimes the heating apparatus causes the damage; or the stinted supply of water often given when the plants are in use in the house may produce failure of the ti-sues, or being placed in a draught of cold air may cause the trouble. The fact is, the plants can barely live in such situations, and their growths suffer.

Pelargonium with Diseased Leaves: H. and B. There is no means of determining from the "tops" sent, what is the cause of the condition. There is clearly no inna'e fungus disease of any kind, and from the habit and appearance of the plants, we should conclude that the cause of the disease is not in the plants themselves, but in some external surroundings. The microscope shows a thoroughly normal condition of the tissues. M.C.C.

Single-Flowered Petunias, &c.: C. F. B. Any good florist or seedsman would supply seeds of German and home growth—in separate colours or mixed. What do you mean by the American Giant of California? is it a Petunia?

"SMILAX: " W. J. P. The correct name is Asparagus medeoloides, vide Index Kenensis.

Wholesale Cut-flower Dealers in France; G. B. We cannot recommend traders, but would advise you to obtain The Fruit Growers' Year Book, which contains numerous addresses, home and foreign (London: The Cable Office, 30, Fleet Street, E.C.).

SEED ORDERS.—REDUCED PRICES.

When you make out your SEED ORDER include the BEST and CHEAPEST INSECTICIDE for FUMIGATING, viz.:-

Complete in themselves, without lamps or spirit. Ready for use at any moment. ROLLS (Complete in themselves, without lamps or spirit. Ready for use at any moment.

An improvement in process of manufacture enables us to reduce the old prices:— CAMPBELL'S

No. 2 Rolls, for 500 cubic feet of space 5d. each. No. 3 Rolls, for 1000 cubic feet of space ... 8d. each. No. 4 Rolls, for 2000 cubic feet of space 1s. 2d. each.

Direct from us or from any Seed or Nursery Firm with whom you deal,

The fumes from these Rolls being of greater specific gravity do not pass away through the openings there may be in roofs, nearly so quick as vapour does, Insects are therefore exposed to their deadly influence for a longer time during the fumigation.

NO INJURY TO PLANTS, FLOWERS, or FRUIT.

For Dipping or Syringing, order LEMON OIL, which has been before the Public now nearly ten years:—
Pint Tins, 1s. 6d.; Quarts, 2s. 9d.; Half-gallons, 5s.; Gallons, 9s.

ORCHIDS — ORCHIDS.

Clean, healthy, well-grown plants at reasonable prices; many large specimens and rare varieties.

CHOICE DENDROBES A SPECIALTY. PLEASE WRITE FOR LIST.

JAMES CYPHER, EXCITIC NURSERIES. CHELTENHAM.

FRUIT TREES. JAMES VEITCH & SONS

Beg to call attention to the following Sterling Novelties: -

APPLE, ROYAL LATE COOKING.

A valuable culinary Apple, keeping nine to twelve months. Award of Merit Royal Horticultural Society. Maidens, 5s. each,

NECTARINE, PRÉCOCE DE CRONCELS

Ripens several days before Early Rivers.

Maidens, 3s 6d each Dwarf-trained, 5s. and 10s. 6d. each.

PEACH, LATE DEVONIAN.

A very fine, late, highly-coloured variety for outside. Award of Merit Royal Horticultural Society. Maidens, 7s. 6d. sach.

PEAR, PRESIDENT BARRABE.

A very highly-flavoured Pear of large size,

Maidens, 2s. 6d, each,

Illustrated Catalogue, with full descriptions of the above, post-free on application.

THE ROYAL EXOTIC NURSERY. CHELSEA, LONDON, S.W.

GARDEN SEEDS

WE have completed Harvesting our Crops of

GARDEN SEEDS, &c., and will be glad to make Special Offers on application,

SATURDAY, DECEMBER 26, 1896.

EASTWELL PARK, ASHFORD. KENT.

DEOPLE sometimes imagine when they see a great house that has been for some generations in one family, that it has undergone no changes during a much longer period. We often read of people whose ancestors came over with William the Conqueror, and are inclined to imagine that the estates on which they settled down then, have remained in the hands of their descendants until our own days. There are, indeed, some to whom this does apply, although they are few in number. Thus, in the neighbourhood of Ashford, the Surrenden estate was granted to a Dering at the time of the Conquest, and has remained in the family in an unbroken line from that time to the present; but this has not been the case with the manor and park of Eastwell. Many are the changes through which it has passed, and many are the families who have had possession of it.

Eastwell Park (see fig. 140, p. 781) is one of the most picturesque and extensive in the South of England, being situated on those hills which form part of the backbone of Kent; its extent is about 1600 acres, and it contains some grand trees, the Beech being especially fine. It is mentioned in Domesday Book as forming part of the possessions of Hugo de Montfort, and came into the hands of the Crown in the time of his grandson in the reign of Henry I. It was held under the Crown by a family who took their name from it; one of whom, Mathilde d'Estelles, held this manor, with the advowson of the church on it, at the time of her death in the fifty-second year of the reign of Henry III.

After various changes, the manor passed into the hands of Sir Thomas Moyle, who was speaker of the Honse of Commons in the reign of Henry VIII. He rebuilt the mansion, leaving it to his daughter Catharine, married to Thomas Finch, gent., who was afterwards knighted. and resided there. A descendant of Sir Thomas Finch died in 1614, leaving a widow, the Lady Elizabeth Finch, who in James I, s reign was created Visconntess Maidstone, and afterwards, in the reign of Charles, was made Countess of Winchilsea, in Sussex. One of the family, afterwards, in accordance with the will of his aunt, took the name of Hatton, and the family name of the Earls of Winchelsea became Finch-Hatton. The park remained in their possession until a few years ago, when the changes which have taken place in the fortunes of our country gentlemen led Lord Winchilsea to let the mansion and pleasnregrounds. It was tenanted for some years by the late Duke of Abercorn, and afterwards by

H.R.H. the Duke of Saxe Coburg and Gotha, then Duke of Edinburgh, after that by Mr. H. A. Campbell—but three or four years ago the whole estate was sold to Lord Gerard, who now holds possession of it. There is a certain amount of romance connected with the place, for it is said that Richard Plantagenet, an illegitimate son of Richard HI., lived here and worked as a mason, helping to rebuild the mansion in the time of Sir Thomas Moyle.

But my object in writing about Eistwell is not to dilate on the beauty of the park, but to tell the great changes which have taken place in the gurdens since the occupation of Lord Gerard. I knew the gardens in former days, and they were utterly unworthy of the place, the houses were bad, the amount of labour employed was insufficient, so that it always astonished me to see the results obtained by Mr. Thomas Woodford, now of Atherstone, who then had charge. He was a keen plantsman, his plants figured at many of our local shows, and as a Grape grower he could not be excelled. It is, of course, very difficult, under such eircumstances, to keep up the flower-garden, but this he did in accordance with the taste of those days, which demanded the bedding-out system. But now there is an extensive range of plant-houses in connection with the house, while at some distance adjoining the kitc' en-garden there is an admirable range of fruit-houses. Lurge sums of money have been expended, and everything is done that the latest improvements in horticulture can suggest; but unfortunately Lord Gerard does not intend to live there, and is anxious either to let or sell the place.

In the old times there was a long glazel passage leading from the library into a conservatory, which was old and utterly unsuited for plant growth; this has all been done away with, and a new house has been built in place of the old one as a winter garden, which is 160 feet long by 56 feet wide and 40 feet in height. This is planted with various species of Palms and Tree Ferns, which in a few years will, no doubt, give it a very delightful appearance; while the climbers are Cobœa scandens and variegata, and Tacsonia Volxemi and insignis, Plumbago capensis, Bignouias, and Tecomas. Beside the Palms and Tree-Ferns, there are good plants of Musa, Acacias, Azaleas, Cyperus, Cannus, Draconas, Agaves, and other foliage plants. From this there is an entrance to the conservatory, a'so 160 feet by 25 feet, and 20 feet in height, and in this various greenhouse plants are growing, and are evidently in excellent health. From this again e stend seven plant-houses, each 80 feet long, and which at the time of my visit were filled thus-two with Gloxinias; two with stove plants, consisting of Eucharis, Crotons, Marantas, Allamandas, Clerodendron Balfouri, Musas, stove Ferns, &c.; one with Streptocarpus and Ferns, one with Coleus, and one with Petunias and Fuchsias. All these plants were in admirable condition, and I have seldom seen anything in their way so fine as these Gloxinias; they were only seedling plants from Sutton's strain of seed, all erect-flowering, and with large solid flowers of the most beautiful colours, deep crimson, lovely azure blue, and spotted flowers of great variety. Hero also I sav for the first time in any quantity that charming little Ramondia-like plant Saintpaulia ionanthe; it is a pity this lovely little plant, with its beautiful blue flowers, is not quite hardy, or it would be a delightful one for the rockery.

It will be seen, if I have made my meaning clear, that anyone can enjoy the whole of this range with its varied and beautiful contents without once going into the open air truly it thus deserves the name of Winter Garden. I may add that the whole of this range reflects credit on the skill and intelligence of Mr. Walters, the head-gardener.

Passing away from this range of houses we come to the Rose garden, which I remember in former times as one of the best cultivated kitcheu-gardens I ever saw. The soil is a good tenacious loam, and most productive crops of bush fruits, Strawberries, and vegetables were to be seen in it under Mr. Woodford's

eare: it is enclosed by a high wall, and I am afraid owing to this and the trees which surround it, will not suit Hybrid Perpetuals, which I fear will suffer from mildew. Teas will probably fare better, and indeed the growth of some which I saw indicated this; but a good deal has still to be done before it can really deserve the name of a Rose-garden—its size is 2 acres, and it will readily be seen it will require no small number of Rose-plants to make a good display. But should it be found that Hybrid Perpetuals will do well in it, it will be very easy, by means of cuttings and budded plants, to fill up the gaps; and if this be done, it will doubtless make one of the most charming private Rose-gardens in the south of Eugland.

Further away, and at some distance from the mansion, is the new range of forcing and plant houses, and a little beyond them the new kitchen-garden; these houses consist of a Peach-range 120 feet long, Nectarines the same, a vinery 100 feet long; there are eight foreing-houses for Melons, Cucumbers, and Tomatos, and eight plant houses all 200 feet long. These plant-houses were filled when I saw them, one house with Begonias, two with Carnations, two with Pelargoniums, and one with Celosias, Balsams, and Ivy-leaved Pelargoniums. I was particularly struck with the Begonias, which confirmed me in the opinion I have long entertained that the time for growing named collections of these flowers is past; for here was a collection of both single and double flowers of all shades of colour, with stout large and well-formed flowers, and all seedlings of this year. The plants were exceedingly well grown, and just as now no one dreams of growing named collections of Cincrarias or Calceolarias, as used to be done in my younger days, so it will be in a great measure with tuberous Begonias. The Streptocarpi were also very good, and are found particularly useful both as table plan's and for cuttings. It will be seen from the plants that I have enumerated that such as are most suitable for indoor decorations are those which are chiefly grown.

These are by no means the only alterations which have taken place in this beautiful domain, nor the only points of interest. The park contains one of the most beautiful artificial lakes that I have ever seen. comprising about 15 acres, and as I have already said, some grand specimens of forest trees. The flower-garden in front of the mansion has been remodelled, terraces and banks have been formed, and new pieces of artificial water made. I have not dwelt upon these matters, but only on the changes which have been made in the garden, as they seem to represent to me the best aspect of modern horticulture, and to show how, even with such a small staff, an intelligent gardener like Mr. Walters can manage to make his houses gay, and also have a constant supply for house decoration. Wild Rosc.

NEW OR NOTEWORTHY PLANTS.

DISA PULCHRA, Sonder,

The flowering of this remarkable and showy species, for the first time under cultivation in the collection of Orchids belonging to the Hon. Walter Rothschild, Tring Park, is a very noteworthy occurrence. Although the species was originally described in Linnan XIX, 1847, and dried specimens gathered on the eastern frontier of the Orange Free State had often excited admiration, no one had succeeded in inducing any of the few tubers imported to produce flowers to verify the beauty which the dried specimens showed the plant must have had when living. Some spikes are 2 feet in height, bearing upwards of twenty flowers, all of which are open at the same time.

Disa pulchra has stout tubers, and the plant progresses by making new tubers to take the place of the old ones, which gradually decay after flowering. It does not produce young plants on stolons like D. uniflora, D. tripetaloides, D. racemosa, and others of that section. Although totally distinct from any other species, it is perhaps nearest to D. nervosa, illustrated in the Gardeners' Chronicle, September 15,

1894, p. 309. An extraordinary point about it is that when observed at a short distance, the leaves and inflorescence bear a stronger resemblance to some species of Gladiolus than to any of the other Disas. Its leaves proceed from the erown of the tuber, are firm in texture, of a bright green colour, and on the inflorescence, gradually diminish into the bracts, which equal in length the red-purple ovaries. The leaves, as they ascend, get rather lighter in colour, the bracts themselves being pale lilac tipped with green. The segments of the flowers are more equal, and arranged more like those of some of the epiphytal Orchids than those of any other species of Disa. The odd sepal, which is slightly concave, is the largest of the three, and it is prolonged into a spur one inch in length, which in the older flowers turns abruptly upwards. The sepals are of a pale lilae tint, with a few slight purple lines and dots, and the spur is coloured light purple. The petals are much smaller than the sepals, and curiously crossed over the short column at the base, closely folding over the pollinia, and the blade of each crossing to the opposite side; in colour lavender, with a distinct purple margin. The lanceolate lip is nearly as large as one of the serals, and in colour of a light shade of lilar, with a very thin purple margin and line running down the centre. The colour of the flowers is said to vary from white to purple. is a most desirable species, which it is hoped will be as amenable to culture as are some other showy Disas introduced of late years. At Tring Park, the tubers were potted into fibry-peat, loam, and sand, and placed in a cold frame for the summer, and on two or three showing flower-spikes they were placed in an intermediate-house, where the one forming the subject of our illustration (fig. 141, p. 785) successfully developed its flowers. J. O'B.

ORCHID NOTES AND GLEANINGS.

WHAT CONSTITUTES A "CRISPUM?"

I WAITED to see if any other reply would appear. As only "W. S." (p. 686 of Dec. 5, 1896) takes the trouble to help me, I will go ahead. I do not place much stress on Bateman as a clear delineator of a plant when he renamed the species, but that does not make the drawings in his Monograph any the worse; the analytical drawings of teeth and crest therein go to show my argument in regard to a "pure" crispum.

In bringing the Veitch Manual of Orchidaccous Plants up as an authority, I do not see much to strengthen "W. S.'s" case, as therein we are asked to accept Andersonianum and Ruckerianum as crispums. I do not for a moment suppose "W. S. agrees to that, for the photograph he says (I believe I have had a copy of the same plate from his able hands as a photographer) contains a true "Andersonianum," or, as his letter calls it, an "undoubted hybrid." This true and "undoubted hybrid" is the erispum x gloriosum hybrid, and bence quite different to the forms with big crispum-shaped lips, There is great difficulty at present in really proper classification of the thousand-and one forms, and to save a good deal of trouble, a great many are called "crispums" that have no right to be so called. I can recall a plant under the care of "W. S." once figured as O. crispum ocellatum; that plant he has since shown, it is a beautiful "Ruckerianum"-be knows it too

"W. S." chose one in his list, viz., that distinct thing, "Chestertoni," as one that it would be difficult to persuade growers that it was not a crispum. Baron Schroder showed the original plant on Nov. 10, 1896, and had "W. S." looked carefully into that flower he would have seen that it was a hybrid containing a lot of luteo purpureum, with the whole ground colour yellow, the sepals and lip only heavily blotched. This is the plant sent over by and named after Chesterton (see Veitch's Manual, p. 31). Those in collections, and known as Chestertoni, as far as I have seen (vide the Pollett Sale Catalogue, March 15, 1893), are only five broad so-called crispums, full of

spets, and totally unlike the originally named one. "W. S." also adds "crosses" that it will be difficult to persuade growers are not crispums. My reply is, "How can a cross be a species!" for that is what O. crispum is considered to be by "experts." If they are hybrids, they are not crispums, and if not they should not be called 60.

Ne one who looks earefully at the figures in Veitch's Manual of Orchidaceous Plants can accept all the forms there figured as crispuns. I did give my definition of a crispum in my first letter, and if "W. S." will look over all the next thousand forms he sees, I think he will agree with me. De B. Craeskay.

GARDENERS' FRIENDS. HOUSE-MARTINS.

BY HARRISON WEIR. (All rights reserved.)

AKIN, being of the same family as the swallow, is the house-martin, and as charming in all its movements, its habits, and form, while it is equal in utility. Martins and swallows have ever been venerated in the rural parts of England, and they are indeed loveable birds in many ways; their beauty, their graceful flight as they circle around the house on light and buoyant wing, and their ever-prosent activity as insect-killers, all tend to endear them to At "the old farm-house" now, there are no housemartins: they have gono, from where numbers lived, "and had their being." The house-sparrow has hattled all away long ago; there has not been a nest there for years, and the starlings breel and chatter about what was once the home of the swift. Nor is this a solitary ease, in which the ever-aggressive sparrow and starling have driven from and kept the sunny nooks and walls that held up the mnd-made dwellings of this hird beloved by all, and also the soaring swift.

Shakespeare loved the house-martin, doubtless as many another poet has, and does, for he calls it—

"The guest of summer,"

as, indeed, it is, for it comes not here until the days are mostly warm, the fields are green, and the flowers of many hues make garlands of rare beauty everywhere. And further, Nature's "Time-hononred Son" notes that—

"Where they

Most breed and hannt, I have observed, the air is delicate."

Bewick says of the house-martin that it arrives later than the swallow, which is correct, but he adds, that it "does not leave so soon." This is not so, for long after the last house-martin has left for warmer climes, the swallow is seen, even as late as December 3, while the former "flits" generally by the end of September. Here (Sevenoaks), 1894, the last congregated and left October 1; 1895, September 30; 1895, September 28; though I saw others near Arundel some days later.

Although the house-martin is so well known, and is so "neighbourly" in its habits, still there are peculiarities that have not usually been observed. Nor was I aware of much that I have but lately learned, though the very sight of the joyous bird has lent me a life-long pleasure. It happened thus:—
"About four years ago I added to my house a

room or two. The roof projected, and made dry and well protected "over-hung" caves and outside rafter ends. My delight was indeed great when going into the garden on May 11, 1894, I observed a large uninber of martins clinging about the new part of the house. There seemed much contention as to which should stay and build, and which not. After a while and a sharp fight, most of them left, and the next morning early three commenced a nest over a window. The weather was dry, and so they had a long way to fetch the mud, which they got from the watered road near the railway station. To and fro, early and late they toiled. On the first day they merely laid the foundation. This, apparently, did not dry well, for next day they only worked in the morning. The following day was still and fine, the dust blowing up. They ceased building at 10 A.M. On the 15th they finished the nest externally. It was noted that as they put on the mud they seemed to wet it with moisture from their beaks, and pressed it down by a continued lateral movement of the breast. One eurious fact was, that there were three birds at work building the nest. After the nest was finished, it was not occupied for nearly two days. Another nest being built in front of the house in less time, and this also had three birds at work, and was not occupied for two days after finishing. When occupied, at first two birds went into the nest at the same time, and during their stay there was a low, sweet, continuous warbling. On the 18th same conditions; 19th also; there were seven or eight birds flying about, and all visited the same nests. This was not entirely my own observation, for I got others to witness this fact. On the 21st some more birds came, and another nest was built, and another in front of the house-four in all. Now came a curious incident. The first pair, as soon as the young could fly, disappeared with them entirely: this was about the middle of June. The second nest was vacated soon after, and the old birds also never returned. Then those in the front nests took their young away and left them somewhere, came back and hatched-out two more broods; these left about the middle of August, at which time all the nests were deserted. 1895: the two front nests were occupied on May 4, and three others built. Although the birds that built the two back nests left early in June the previous

Fig. 139.—Palms in a garden at cannes. (See P. 780.)

TRIANDROUS CYPRIPEDIUM.

Messrs. Sander & Co. obligingly send us a flower of C. insigne, in which the stamen, usually designated a 1, and which is usually undeveloped, is present on the middle of the inner side of the staminode. The two lateral stamens of the inner row—x 1, x 2—are present as usual.

ORCHIDS AS CUT FLOWERS,

The increasing favour in which Orchids are held as cut flowers is shown (says a Belgian correspondent) by the fact that nurserymen are almost unable to supply the demand. A large firm at Moertebeke, near Brussels, has within a few days cut 9000 blooms of Cypripedium insigne, and can still show 4000 buds. Other horticulturists also grow Orchids in ever-increasing numbers.

man. Years and years ago, though but "a tiny thing," when visiting "the old farm" in Kent, nothing delighted me more than to get a stool and sit in the garden-the old-fashioned garden-full of sweet odours, the breath of the spring flowers and shrubs in blossom, the air musical with humming-life; here I would stilly sit to watch the house-martins building their nests, or feeding their sitting mates, and afterwards their newly-hatched young, or note the darting swifts that had a home nnder the eaves of the old house, the gable part which "took" the rays of the rising sun, that mellowed the morning air. In a far-away gaze I see the joyous birds, now building, flying, feeding, and searcely ever resting, and so from early times through a long life, I have ever loved the bird, the bird of spring, the homely bird, the house-martin.

year, they did not return until May 20, this showing that though of one colony, those at the back of the house must have gone to a different, and possibly, a far more distant place than those in front, they taking lenger to come back. Also, these birds again left early (about the end of June) with their young. Two fresh birds came on June 10 (very late) and commenced a nest, but got no further than the foundation, when they left. This year, 1896, the front birds all arrived May 10; another nest was built making six in front. At the back, those who built the two first nests never returned; but a pair came about May 20, and finished the nest begun the year previously, hitched a brood. Then young and old left at the beginning of July; the birds in the front nests occupied some of them as late as September 17 or 18. Here it should be noted that the birds left and came again in pairs, and went to and occupied the same nests. Also what I wish to call attention to, is that it appears that the house martins have no particular time of "coming" and "going," but come an I go according to the season or distance of their migration, and that the young are taken away from the locality. where they are hatched, and in some way got rid of, when the old birds return and incubate again. But, as I have shown, this is not always so, and that it is only these last broods that congregate, and go off in a body, unless the young that have been early disposed of stry on in a flock somewhere, and await the final exolus. I have mentioned this at length, as this difference in time of departure and arrival is new to me, and may be so to others.

I know of no greater delight than to watch the house-martins on the wing, as they skim in eddying, whirling flight; the white patch on the back and the breast seems to float on the air, and then is lost again—now here, and now there, but never far from home; in this unlike the swallow, with the exception of the time when building. "My birds" seldom went more than 500 feet away, roun ling the house continually. When the weather was genial, they were flying in search of insects at 4 A.M., and once at 3.30 A.M. all were "at work," and so on until sundown, day by day, if fine; wet days they flew little.

It is curious how they congregate in some localities, and hang their nests in clusters much like a bunch of Grapes. Such was the case at Matfield House, Matfield Green, Kent; around and above the upper stable-windows one might have counted thirty nests, while on the adjacent buildings and the house itself, there was scarcefy a dwelling nade. Although the house-martin is a bird of no song or but little, yet the lively action, the eccentric flight circlings, the swift undulations and flashes of colouring from space to space, give a life and cheeriness, that produces an exhibitation and a feeling of pleasure in the watching and observation of that is to be enjoyed from no other bird.

With all these attractions, these beauties of life and "doing," this friend of man, this bird beloved of all time, is decreasing in numbers. Much of this is owing to the predatory pugnaciousness of the sparrow, as well possibly of the variation of climate. A friend of mine, a few days ago, told me that the sparrows had driven off all the house-martins from his buildings for some years, and that the house-martins, by way of security, had now built, and attempted to build, inside the village school-room.

I hope and trust that those reading these notes will try and do his, her, or their utmost to protect in every way a bird at once so charming, so useful, so ornamental, and so lovable.

FRENCH PRUNES.

Agen is the capital of the department of Lot-et-Garonne, 400 miles south-west of Paris, and the centre of the region which extends throughout the valley of the Garonne, where the famous Prunes are cultivated. The Prune is a kind of natural specialty of that soil, which explains why no competition is feared. There are numerous varieties of Prunes. Duhamef divided them into two classes, following the colour of the fruit, the red-violet, and the winte-yellow or greenish. Though bearing the

name of Agen, the fruit is not much cultivated in the vicinity of the city, but chiefly on the borders of the River Garonne, from Marmande to Villen-tuve. The Prunes are also known by the name of Prunes d'Ente, which merely signifies, that they are the out-put of grafted trees. The Agen Prune was introduced several ages ago near Clairac, by monks, who brought it from the Eist. The trade recognises eix varieties of Prunes. The French Plum, or Prune, thrives best on a calcareous clayey soil; indeed it succeeds on all soils, save the very light or sandy. The tree exacts less eare than that of the Apple or Pear. As it blossoms very early in spring, regions where late frests are prevalent should be avoided; the Vine districts are excellent, the more so if they be sheltered. Indeed, the Prune is often cultivated in parallel rows in vineyards and orchards; having shallow roots, the leaves of the Vine shade the soil for the Plum trees. Ordinarily, the latter are purchased from the nurseryman when aged three years, and ready grafted. About 1,600 francs is the average price for an acre of Plum trees, and they will prove remuneratively productive during twenty years, if fairly manurel, especially with woollen rags and horn shavings.

The fruit is known to be ripe by its odour, and the ease with which it falls when the tree is sliaken; a mut is spread on the ground to receive the Prunes, as they being very delicate must not be brnised; such as are naturally had are rejected. The fruit ought never to be 'gatherel with the dew on them. Humidity is the great enemy of Prune farming. The fruit harvest is rarely good two or three years in succession. The trees are planted 11 yards apart, and yield from 14 to 84 lb. per tree of fresh fruit. The latter, when gathered, generally in the early purt of August, are spread on a layer of straw, or ranged on oster open work trays or hurdles to dry. They benefit by exposure to the sun for a day or two; it favours the evaporation of the humidity in the pulp. Now commences the processes of preparation, of the cooking and drying, on which success depends. The muchinery for drying the fruit, that is to say, the method of constructing the ovens, are numerous. The renowned Prunes of Tours are prepared from the variety known as Sainte-Catherine. After their stalks are removed, they are spread on the hurdles in single layers, and exposed to the sun during several days till they become softish. Next they are placed in an oven heated to 140° Fahr, and hermetically closed during twenty-four hours, when they are taken out and exposed to the ordinary air. Next they are replaced in the oven, heated to 158', and rising to 176°. The process is renewed, on the whole, three times, gently raising the heat to 212°, and shifting the surface of the fruit by delicately agitating the hurdles, while never touching it with the fingers. The Prunes being now semi-desiccated, they are

taken one by one, and pressed between the finger and thumb so as to impart that oblong and flit shape which first quality Prunes are expected to possess. This operation finished, the hurdles are placed in an ordinary baker's oven after the bread has been removed. the door of which is firmly closed. Here they remain one hour, and then withdrawn. A vase full of cold water is introduced into the oven, and when the water, has risen to 131° and 119, the hurdles are re-introduced, the oven closed, they there remain twenty-four hours more. All is now terminated, when the Prunes become, strictly speaking, pruncaux. The condition of the latter, known as fourre's, are thus prepared. Before the Prunes enter the oven for the second or third time, they are slightly rolled between the finger and thumb, so as to squeeze out the stone; the latter is replaced by a second smaller and prepared stoneless fruit, which is thrust or four re inside the first. There are firms that, instead of the usual oven, have a special stove, where the three temperatures 140, 176, and 212 degrees Fali, are attained successively. The first two temperatures are destined to evaporate slowly the water in the fruit; the third to cook it completely, and so seenre that black shimmery appearance so much sought after by purchasers, while guarding its special elasticity and esteemed quality. If the temperatures were not moderated, and successively angmented, the interior of the fruit would boil, and the skin swell and burst; the syrup would then exude, become glutinous, and so be lost. While passing through the ovens, the Prunes are turned on the hur.lles, but, as already remarked, never touched with the fingers, so as to avoid injuring the tender skin. Once cooked, the Prnues are placed in a wellaërated and dry store. Extreme care must be taken to prevent the Prunes absorbing the slightest humidity. During the processes of preparation, the Prunes lose 50 to 60 per cent. of their weight. Thus prepared, the Prunes will keep good in temperate climates for two years; after that they spoil, no mitter how carefully they may have been packed. This is in part remedied by drying them, and subeeting them afterwards to the action of steam.

Pistoles are only Prunes from Brignoles, made from the choicest of the Plums; they are never gathered till noon, when the sun has thoroughly dried them.

Prunes fleuries are prepared from Plums of the second category. When gathered, and in full freshness, they are thrown immediately into a vat filled with boiling-water; here they are left for a few minutes, which causes the sugar in the fruit to be drawn outward to the skin. Taken out, they are dried in the open air, but always in the shade, for four to six weeks, according to temperature. The skin in due course becomes covered with a bloom or duret, to which the technical name of feuric is given. The boiling-water produces the well-known corrugations or wrinklings of the skin; but all the natural characteristic qualities of the Prunes are maintained.

The trade in French Prunes is very important, and varies from fifteen to twenty millions of francs, following the estimates of the Bank of France branch at Agen. Bordeaux, which is the centre of the export trade, alone ships annually Prunes to the value of 8 million francs to all parts of the world. The prunes are classified according to volume and weight in ten categories, by passing them slowly through a series of sieves, having mathematical measured meshes; so many prones (92 to 30) go to a pound, and on the box, wherein they are nicely packed, the number of Prunes contained therein is stated, so that no deception is possible. Before sending the Prunes away, the Bordeaux merchants flatten the fruit between cylinders sheathed with india rubber, and afterwards they are gently pressed by machines into the boxes. Other merchants simply range them in boxes of 2 and 3 lb. in weight each, and hermetically close the lid. Edward Conner,

PALMS ON THE RIVIERA.

Han it been known twenty years ago that the majority of the Cocos which have found their way into the Riviera gardens would have attained such gigantic dimensions as they have done, they would have certainly been planted in greater numbers. It must not be understood that isolated specimens are out of place—au contrair, they form beautiful features in the landscape of our gardens, their long smooth trunks standing out as sentinels against the deep green vegetation around; but groups and avenues of them form a very striking and tropical feature, as the accompanying photograph shows (fig. 139, p. 779).

Here and there some very line specimens may be met with, as in the Villa Valetta gardens at Cannes, where may be seen a Cocos flexuosa with a trunk 32 feet in height, and the fronds measuring over 15 feet in length.

Now that many of the older specimens flower and fruit annually, it is remarkable to note the great variation in the seeds of the C. flexnosa types, upon which basis many of the said species have been named, but which to me seem only forms of the one and same species.

In the foliage there is also great variation amongst them, some having light graceful fronds, and others an erect heavy appearance, the former being most desirable, as they resist better the heavy winds, whilst the latter are often broken about; and there is a heavy-foliaged variety known here as C. dactyle (?), which often has its young leaves broken down each year by the winds.

There is amongst them a variety known as C. Romanzoffiana, but I am doubtful if it exists here, as the true variety has a pendulous spathe, and there are none, as yet, which answer to the description. Amongst the Cocos australis type, there is a confusion of nunes which one meets with, as the latter, for instance, is also found under the name of C. Bonnetti and C. campestris. Then there is C. Blumenavii and C. Yatai, which resemble the rest to a great extent. The Cocos delight in a porous soil, doing best in granite or a similar soil, with plenty of manner during the summer, but not so much water as the majority of our Palms.

Over watering has been the death of many a fine

by hybridisation to form the modern Strawberry. Remembering how apt some plants are to "throw back" to a former ancestor, and suddenly exhibit the peculiarities of a long forgotten strain, it will readily be understood how the tendency to vary increases with the number of progenitors. Hence it is that the Strawberry is apt to play tricks and disappoint the grower. The normal plant is bisexual, that is, every flower has its proper complement of stamens to produce pollen, and p'stils to produce seed. When all goes right, the pistils are fertilised by the intervention of bees or other insects, who worry about among the anthers of the stimens and get covered with pollen. Some of this they are sure to deposit apon the receptive tips of the pistals, which immediately answer to the physiological cill upon their powers, dropping them here and there, that is, sowing them and providing for the dissemination of the species. Mind, I do not say that there is direct intent in this collaboration of Strawberry and epicurean fruition. But the result is just the same as if there had been a conscious and previously-planned arrangement. At this point, man interposes, and annexes for his own use the results of whole cycles of Darwinian development. That is how we get our Strawberries.

ONow it has often been argued, with no little show of probability, that most or perhaps all plants of moderately high development used to be respectively unisexual, that is, there were mules and there were females, just as is the case with anima's. Most of the oldest plants now representing the flora of past geologic ages, and surviving like descendants of historic

Fig. 140. Catenouse at factivity park, ashfore kinds (see a 777.

Cocos here, and especially the C australis varieties, which do not like a lot of water; in fact, where the soil is of a stagnant nature they will not grow. Riviera.

THE VAGARIES OF THE STRAWBERRY PLANT.

The following paragraphs are the expansion of a brief report by Prof. MacOwan upon a correspondent's letter on the barrenness of his Strawberries:—

The difficulty noticed by correspondents with regard to Strawberries failing to fruit has certainly increased considerably of late years. The modern Strawberry is quite an artificial product, and by no means merely a wild plant brought by culture to a greater state of perfection than could be gained under natural conditions. There are about seven species, or quasi-species, all of which have been in cultivation, and at least three of these have contributed

and commence the maturation of the see's -or to speak more correctly, the little seedlike finits which lie one at the base of each. While this main object of the plant's existence is in progress, other and very extraordinary changes are taking place. The one we are concerned with is an excessive development of the receptacle or disk upon which the pistils were originally supported, and which at first was of a texture somewhat like that of an ordinary leaf. It enlarges by an astonishingly rapid subdivision and growth of its component cells, which assume a juicy su culence, and a peculiar ethereal flavour. That is the physiclogical work done by the Strawberry. It has for its object the perpetuation and distribution of the species. The perfumed, juicy, sugary flesh of the enlarged receptacle is a bait set forth by the plant to induce some discerning epicure of a bird to peck away at the pulp and swallow it along with as many as possible of the seeds. The bird digests the pulp to his great satisfaction, and passes the secds unharmed,

heroes, are thus unisexual. This is the case with our Cape Restios, the "dak riets" and "besomriets" of the flats. So with all the Leucodendrous, the Cycads, and the whole family of Willows. Others have gone a step further in economising their physiologic work of reproduction, and bear male flowers and female flowers, distinct from each other, but on the same tree or plant. Such are the Pines, most Palms, the Bananas, and hosts of weedy Cucurbits. Nettleplants, and even the royal Oak. A still further economy of space and convenience next prevailed. Each flower became in itself both male and female, having overies to conceive and reproduce, and stimens, or their equivalent, to fertilise and set the physiologic process going.

"With all this vast pedigree of change, stretching back into old world history, what wonder that even the humble Strawberry sometimes forgets the modern scheme of things, and reverts to an ancestral fashion of shaping its life! And the more highly it is bred in and in, to increase as much as possible the great succulent receptacle, which is to the plant itself of secondary importance only, the more likely is it to include in these vagaries, and become unisexual like its remote ancestors. The infertility consists in the plant producing only staminiferous or male blossoms, which of course, cannot bear fruit; or, a more frequent ease, in failing to form any males at all. The bees generally bring enough pollen from far to make up for the latter fault, but they can do nothing to help the former failure. The gardener has to take the matter in hand himself, rogue out the barren males, or reduce their number to the few sufficient to give enough pollen to go round among the pistilliferous flowers. The weeding out is exactly analogous to the farmer's duty in weeding out a superfluity of rams from his flock, and maintaining the proportion of reproductive ewes.

"Then it amounts to something like this. In starting a new plantation, put in the first setts rooted from runners. You watch their first blooming. They will give normal bisexual plants, pistillate plants, and perhaps barren males. You may keep a few of these last, and intercalate some in each bearing row, but the general practice is to destroy them, and carefully arrange that, in planting up for bearing, there shall be one sound bisexual individual for at least every three or four pistillate ones. The busy bee will do the rest of the work, and see to the pollination of every one of them. I suppose it is a counsel of perfection, to which nobody will attend, that a bearing bed of Strawberries should not be maintained more than four seasons at most, but ought to be broken up in its regular rotation. The fruit from an old five to seven year bed is not worth picking for murket, unless indeed the seller is in the mind to put rubbish underneath and finish off with a layer of toppers to catch the customer's eye. The old first-class kinds stand longer than do some of the recent novelties, a few of which I have known to fail after two seasons, and have to be grubbed up. P. MacOwan, in Agricultural Journal, Cape Town.

FORESTRY.

TYPES OF BRITISH WOODLAND.

(Continued from p. 689.)

The reasons for Beech Woods on the Chilterns, -Although the Beech is plentiful enough both in park and woodland throughout Great Britain, it is only on the Chiltern Hills of Bucks and Oxon that it can bo called a predominant timber tree is woods. Round High Wycombe (with its chair factories and saw-mills) woods abound which contain scarcely anything but Beech and a few stattered Holics and Yews, and which have cost their owners practically nothing in the way of planting or transplanting from time immemorial. Why pure Beech woods should be almost entirely confined to this district it is difficult to say. The affinity of Beech for chalk is one reason, of course, but chalk hills and downs prevail in several other districts of the south of England, but Beech woods are not found to the same extent upon them, Probably, local industries and systems of agric liture have been the means of retaining a large extent of the primeval forest growth of the Chilterns than has been the case elsewhere.

Beech woods provide no pisturage for sheep, and where sheep-breeding has been most extensively pursued, disafforestation has probably been pushed to its furthest limits; hence, treeless downs have generally succeeded the ancient forests which at one time must have covered the chalk hills of the south. [In Sussex, the iron-smelting, once extensively carried on, accounts for the absence of the growth on the downs in that county. Ed.].

downs in that county. Etc.].

Methods of Afforesting. Few trees differ so much mappearance and habit of growth when grown singly in crowded woods as the Berch. With unrestricted growth it gradually forms a done of branches almost as large and as regular in outline as that of St. Paul's, with a short thick and heavily buttlessed trunk, which the timber merchant roje to

and the wood-cutter blesses or anathematises according to his particular view of the labour question. In a crowded wood, a tall cylinder of wood, without branch or excrescence of any kind, and almost as perfectly shaped as if turned out with a lathe, is the The arboriculturist will consider the former type of tree to be the correct one, while the sylviculturist, for obvious reasons, prefers the latter, but both types have their attractive features. In the Beech woods of Bucks, the clean-stemmed type prevails, and occasionally a wood, or portion of one, may be seen, which the most exacting forester could scarcely find fault with; but such cases are comparatively rare, and are more often the result of accident rather than design. For the system of felling adopted in most of these woods is neither regular enough to begin with, nor is it of the right kind to produce the best results. It may be most appropriately termed a cross between the "clearfelling" and "natural selection" systems of the continental forester, but while it does not contain enough of the one, it possesses too much of the other. The system of felling necessary to obtain satisfactory results has already been described in these columns (see July 13, 1895), and need not be gone into here. But still the first law of economic forestry is usually fulfilled as things are at present, for both natural regeneration and the maintenance of soilfertility are well assured in most cases. Every now and then, however, one comes across instances where excessive and premature fellings have denuded the soil of its humus layer on the one hand, and deprived the wood of its mature seed-bearing trees on the other. Under such conditions, Beech woods are no longer able to hold their own in the struggle or existence, and a crop of weeds and coarse grass takes possession of the ground. A. C. Forbes.

(To be continued).

CHRYSANTHEMUMS: A REVIEW OF THE PAST SEASON.

A RETROSPECT of a very varied character comprises the Chrysanthemum season of 1896. At first all looked well; the spring and early summer proved favourable, so that good strong plants were potted on, and placed in their growing quarters under the most promising anspices. Another season of splendid flowers like the preceding one was confidently looked forward to by most growers; but the dry, almost burning heat of midsummer caused a check from which the plants never fully recovered. Up till that time the varied characters of the many varieties was closely watched. Such new sorts as had already established themselves, headed by the popular Madame Carnot, looked as if they would fulfil the good things expected from them. The less known sorts of recent introduction already seemed as if they would be valuable acquisitions, being mostly of a dwarf, sturdy habit, amongst which W. E. Capitant and Wood's Pet, may be cited as examples. The latter, I fear, will not long remain a pet unless the flowers grow larger than they promise to do. M. Chenon de Leché looked promising, while A. H. Wood had very similar growth to Primrose League. Australie did not look as if it would produce the large tlower it undoubtedly does; but Pride of Madford and Oceana, gave promise of the excellent results they so well fulfilled.

Amongst the established varieties, Col. W. B. Smith never looked more promising; Niveum looked better than usual; and in collections from which its non-disea-e-resisting habit had not excluded it, Golden Wedding was better than ever. Viviand Morel and Charles Davis showed their precedity for producing flower-buds in a disagree-thy marked degree. I find the best method of doing these varieties is to grow them on in the usual way until the middle or end of May, and then cut them right down close to the ground. The growth then produced will, in most instances, be strong, capable of finishing off a bloom, of more compact build, and better colour than when grown on without being cut back.

The burning heat just referred to caused many

growers much anxiety. The lower leaves began to assume a sickly yellow hue, and premature ripening of the wood, with its attendant results, looked most threateningly. Unlike most times of drought, no night-dews refreshed the jaded-looking leaves, and artificial means seemed to have less than usual success.

When the change came, growth quickly recommenced—or, rather, the plants began to grow more naturally; but the wet, almost sauless autumn, prevented them from completely recovering themselves. Buds in most instances were taken in good time; and from the first show, right up till the latest, blooms probably were never staged in greater numbers, and competition more keen.

A striking peculiarity of the season is the extended period of the blooming time. This can be accounted for by the laggardly opening of lite buds; and the two fine shows at the Aquarium prove conclusively that the quality of the flowers was good all through, although, owing doubtless to the changeable season, they lacked the sensational quality of the preceding season. A Country Exhibitor.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rotleston Hall, Burton-on-Treut.

Preparatory to Grafting.-Healthy trees of inferior varieties of Plums, Cherries, Apples, and Pears, may be put to good use by grafting them with good varieties suited to the particular locality or soil. should be headed down in mild weather during the winter, cutting off the branches about one foot allower. the points where the grafts will eventually be put in, being careful not to injure the bark below the point of severance, and leaving till the proper season for inserting the young scions, the cutting-back of the branches to the length at which they will be left when grafted. The bods of the Gooseberry and Currant are liable to be devoured in winter and early springtime by bullfinches and sparrows, and it behoves the gardener to take means to prevent their doing this. I have always found that, if the bushes are dusted over with freshly slaked lime and soot-two parts lime to one of soot, when they are wet with dew, it is a simple and excellent deterrent. It may be necessary to repeat the dusting twice or thrice during the winter and spring, if much rain falls. Mixing the quicklime and soot with soap-suds till it is of the coesistency of thin paint, and spraying the bushes with the mixture is equally good, and has the advantage that it is not so easily washed off.

Manure water.—The large quantity of rain which has falen of late, has occasioned large quantitos of manure water to flow from the manure-heaps, which ought not to be allowed to run to waste, it being an excellent stimulus for aged fruit-trees, Itaspherries, and Blackberries, if applied liberally at this season. If very powerful, it should be diluted with water to a safe strength. Wall fruit-trees of all kinds, as well as others that are not productive of any excess of woodgrowth, or which carried full crops of fruit this year, will be much improved by one or two applications. Afford these root-watering when the ground is pervious to moi-ture, and in sufficient quantity to moisted it to a considerable depth.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Doopmor , Madenhead.

Forcing Asparagus.—Where t is work is carried out on an extensive scale, a sufficient number of roots to meet requirements should be lifted in mild weather and made secure against frost. It is always prodent to introduce fresh batches of roots to the forcing-pits before the latest one shows signs of giving out. Asparagus should be gathered as soon as the stalks have grown 6 inches above the crown, and if not required for immediate consumption, they may be tied in small bundles, placed in shallow pans of water, and kept in a frost-proof shell or cell in.

Parsley.—Up to the present time this has not really required protection; but where it is growing in the open border, or even under the shelter of a wall, covering material of some kind should be kept in readiness for use in the event of severe frost. The plants should be cleared of decaying leaves, and some dry tree-leaves placed alongside the rows and between the plants as a further protection against frost. A

few short twigs stuck in along the sides of the rows will keep the covering—any light covering that may be used—from pressing down upon the plants. It is well also to have some boxes filled with the plants, placing these in a cool house; and to cover a portion of the out-of-doors crop with a few garden frames.

Seakale Roots in small numbers should be placed in darkness to force, never allowing the shoots that are fit for use to become long and spindly before using, or cutting them. Should a drying day favour work on the ground, advantage should be taken of it to clear up the vegetable quarters, and wheel away all decaying leaves of Broccoli, Savoys, Brussels Sprouts, &c.

General Work.—At the present time it is scarcely possible to do any work npon the ground, but the men may be profitably employed instead in overhauling the root-stove, the Potatos used in the kitchen, rubbing off the growths, and sorting out the decaying and decayed tubers. Sets of Potatos for late planting should be spread on shelves or floors, thinly, as a check to untimely sprouting; whilst others, especially the forms of Ashleaf, should be placed on end in shallow boxes. Excellent boxes for this purpose were shown at the last meeting of the Royal Horticultural Society by Mr. A. Dean. The ends of these boxes are about twice the depth of the sides, with a slight tie-bar running from end to end, which allows of their being piled several boxes deep when filled with the tubers, while air and light are admitted at the same time. The running and pointing of Pea, Bean, and other sticks may be undertaken at this season, sorting them as the work goes on, into short, medium, and tall.

THE ORCHID HOUSES.

By W. H. White, Burford, Dorking.

Calanthes.—The varieties of Calanthe vestita and the hybrids obtained by crossing the n with C. (Limatodes) rosea, are plants which all should grow who have to furnish cut flowers in quantity at this season. The plants having done flowering, should be rested by placing them on a shelf free from drip, and close up to the roof of a warm-house or pit. Water should be entirely withheld till they are started in the spring. Before placing the plants on the shelf the pseudo-bulb should be cleared of the white and brown scale which frequently infests them. Calanthe Turneri, C. nivalis, and others of the Regnieri section whose season of flowering is the spring, should be kept in the East Indian-house, carefally affording them water as they may need it.

Letiopsis Domingensis, and its closely allied species L. erubescens, better known as L. peduncularis, and L. aeuminata, whose flower-spikes are now appearing, must be carefully afforded water at this stage, but saturation of the potting material should be avoided, or the flower-spikes will fall off. After the flowers of these species fide, a decided rest till growth recommences should be afforded them, and the plants suspended near the roof of the Mexican-house.

Cuttleya or Intermedi desh susc. - The larger number of the Cittleyas are still in a dormant state, i.e., so far as top growth is concerned, with the exception of a few plants that require attention. The new pseudo-bulbs of C. Lawrenceans being now of full size, the plants should be afforded less water at the root; C. exoniensis, now flowering from the current season's growth, will require to have water curefully afforded till growth is finished, after which time the new roots soon emerge from the base of the new pseudo-bulbs, and the plant may then be repotted, if this operation seems to be needed by any of them. The pretty Lelio-Cattleya enterpe should be afforded similar treatment to the last-named. Cattleya Pereivalthan is commencing to push up its flower-spikes, and the plant will need to have a little more water than it it has yet received applied at the root. Plants of C. labiata Warneri and the rare hybrids Lelia Amesiana, L. euspatha, L. Amanda, Lelio Cattleya Canhamiana. and L.-C. C alba, now commencing to grow, should be brought up to the light at the warmer end of the house, affording all of them water in sufficient quantity to keep the compost moist. As soon as growth is finished, remove them to a less warm position where there is better ventilation, and they will soon open their flowers. C. labiata Warneri, if kept too warm and close during the flowering period, sometimes loses its roots prematurely, which causes the shrivelling of the pseudo-bulbs. The most suitthe shrivelling of the pseudo bulbs. able season for repotting the above-named species and bybrids is that which follows the fading of the flowers, the latest made growths then commencing to emit roots from their base. The rare Sophro-Cattleya Calypso is now in bloom at Burford. We find that it should be grown in the coolest part of the intermediate-house. Fresh compost may be afforded the plant when the flowers are cut, or when the roots have become active.

Sobralias.—There plants being in active growth, the old stems that have bloomed may be cut close to the ground-level when the young shoots are well advanced. The new stems should then be tied out clear of each other. In the same house (intermediate) the plants of Cypripedium Spicerianum, C. Charlesworthi, C. purpuratum, and C. Schlimi have recently finished blooming, and any of these which may require more root-space may be forthwith repotted. In doing this, avoid the error of affording large pots; and see that the drainage is open. As a compost, use lumpy peat and sphagnum-moss, which affords ample drainage to such plants as these, which require an abundant supply of water.

PLANTS UNDER GLASS

By Ino. McIntrae, Girdoner, Woodshe, Darlington.

Herbarrons Calecolarias.—These plants may now be shifted into 6-inch pots, which will be those they will flower in, unless large plants are required, when an 8-inch pot should be the size of the flowering pot. The compost should consist of rich fibrous loam, one year in stack two parts, dried cow-dung one part, and river-sand one part. The same kin-l of compost suits the Cineraria. The plants should from the first be grown cool; they will even stand a few degrees of frost without injury. Toey do not suffer from damp to the same extent as Cinerarias, and may therefore be kept in frames till hard frosts become inuniant. The rich compost afforded the plant renders marnial aids to growth unnecessary before the soil gets exhausted, that is, just previous to flowering.

Schizanthus pinuatus and 8, retusus are showy biennials for greenhouse decoration in the spring, and may be sown in the mouth of July and grown on. They require to be repeatedly shifted till they are in 6, 7, and 8-inch pots, I prefer them in the first size, which admits of their being used in various kinds of house decoration. A compost of good loam, leafmould, and river- and will suit them at each shift. Let the plants grow close to the glass so as to prevent spindly growth. They flower continuously for two or three mouths.

THE FLOWER GARDEN.

By Heddey Warren, Gurdener, Aston Clinton, Tring.
Roots of Cannus, Diddius, Lobelia cardinalis, Salvia patens, Begonius, should be occasionally examined, rotten roots and parts of roots being removed, and the raw surfaces sprinkled with charcoal powder. Where a large number of a particular variety of Dahlia is required, and the stock of it is not great, the roots should be potted up early in the New Year, and placed in gentle warmth, for furnishing cuttings, which in their turn will furnish others, also in good time to make strong plants by the time that planting is usually done.

Herbiceous borders may be dressed with decayed manure, which if left on the surface for a few weeks, will afford the plants a slight protection against frost. It can be lightly forked into the soil later on. As many of the plants in herbaceous borders die down in the winter, it is very necessary that each be fornished with a stout label on which the name of the plant is legibly written.

Double Americal Wall Ameris.—These plants are frequently wintered in frames, not appearing to be quite so capable of withstanding frost as the single-flowered varieties unless they are planted in a sheltered position, such as that afforded by a south-west wall. Beautiful as some of the German double varieties are, the double yellow English is still the favourite, and rightly so, for it is extremely floriferous when true. This variety is propagated by slips inserted in a bed of sandy soit loam, and leaf-mould under a handlight. Keep the handlight close till they are rooted, airing the cuttings for an hour it damp be troublesome; and affording air as soon as mooting has taken place. If planted out on a well-drained border at 9 inches apart, the young plants soon grow with one or two stoppings of the leading branches into compact little busbes, fit to make groups, big or little, to fill window-boxes, &c.

General Remarks.—The arrival by post of the nurserymen's seed lists for the incoming year is a reminder that operations will soon commence in the flower garden. There are many kinds of seeds that are almost indispensable which should be obtained as soon as possible, the sowings of some of them being made early in January. These are Centaurea candidissima, Cannas, Marguerite-Carnations, Gre-

villea robusta, and others; tuberous-rooted Begonias, Cobort scandens, Salvia patens, Eulalias zebrint and gracilis, &c. These seeds should be sown in gracilis, &c. These seeds should be sown in gentle heat, in an ordinary hotbed, potting off, genter heat, in an ordinary notice, potting on, and pushing on the seedlings as quickly as is desirable. To those who have no experience of Marguerite-Carnations for bedding out purposes, I would say that after being once grown for this purpose, few owners of gardens would be disposed to be without them, they being almost indispensable, especially in dry seasons like that of 1896. The first sowing should be made in seed-pans or boxes towards the end of the month of January, in gentle warmth, say of 60°. As soon as the plants appear above the soil, remove them to a pit or frame where a little more air can be afforded, and the temperature is not higher than 55°, and as soon as they are large enough to handle they should be potted off singly into thumb-pots, plunging these in Cocoa-nut fibre refuse up to the rims, still keeping the warmth at 55°; and soon as root action begins, ventilation may be slightly increased, especially when the days are warm and mild. This ventilation will tend to check the inroads of green-fly, which light funnigations with tobacco will readily destroy, which is better than syringing the plants with an insecticide.

FRUITS UNDER GLASS.

By W. POPE, Gardener, Highelere Castle, Newbury.

Figs, Eurliest Pot-trees.-When the terminal buds are observed to be bursting into leaf, the temperature of the pit may be increased a little by sun heat, with an increase in aerial-moisture. Afford the plants full sublight by keeping the glass cle in both inside and out, and reduce the condensation of moisture on the glass by affording a small quantity of air at the top of the house whenever this is possible, and whenever the temperature rises above 7%. Syringe the trees twice a day in bright weather, but in doll weather once will suffice, damping all available surfaces in the afternoon. Pay attention to the state of the fermenting material about the pots, not allowing the warmth to exceed 70° to 75°; but should it become warmer, it must be turne I and mixed againand, on the contrary, freshly-warmed material must be added should the mass be getting cool. Night temperature, 55° to 60°; that of the day, 75°, with sun-heat.

Evely planted-out Trees.—If a good body of fermenting material has been introduced here, but little fire hoat will be required before signs of starting into growth are observed, especially if the trees have been previously forced; although in the case of young unforced trees a rather higher temperature will have to be afforded. Syringe the trees twice a day with tepid water, and if the soil be dry, afford water at \$5° to 90°.

Succession and Late Houses.—The pruning and clearing of the trees should now be carried out, using soap suds with a wineglassful of petroleum to the gallon of water if scale exists on them. The cleaning of the glass and woolwork should not be forgotten, and walls should be lime-wished. If any of the old mulching is still on the border remove it, and afford a fresh one, 3 to 4 inches thick of rotten manure. Keep the house cool and dry for the present. Young plants intended for growing in pots should now be potted, using fibrous loam, with a good sprinkling of lime rubbish, and a sixth part of decayed cow-minure added, potting firmly, and keeping the plants to a single stem. If required to be brought on for forcing, plunge the roofs in gentle bottom-heat early in the new year.

Tometos.—The young plants raised from cattings should be kept near the glass in a temperature of 60° to 65°, with a preportionate advance from sun heat, with slight ventilation whenever it is safe to afford it. As these late-struck plants are apt to become drawn, they may be layered on to prepared ridges of soil, or into fruiting-pots, with the advantage of having the fruit close to the base of the plants. The plants should be kept in the post till the layers are well rooted, when they may be detached. One joint should be selected for layering just below a flower-truss, securely fixing it with a peg, and covering with soil. The flowers which expand at this season and later should be fertilised with pollen carried to them on a canel's-hair pencil. If such plants for layering are not in stock, seed for them may now be sown. It is a good practice to place two or three seeds in 3-inch pots, and place these in bottom-heat and near to the glass; and when the seedlings appear, to draw out the weakest; in a few days shift into larger pots, potting firmly and growing them on in light pit or frame so as to induce sturdiness and early fruiting.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Eddor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

WEDNESDAY, Dec. 30. Japanese Lilies and Palm Scods, Roses, Azaleas, &c., at Protheroe & Morris' Rooms.

FRIDAY JAN. 1 Orchids, from Messrs F. Sander & Co., at Protheroc & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—37.3°.

In reviewing the events of the

The Events of year now almost past, facts and circumstances often assume different proportions to those in which they presented themselves at the time. What excited interest then now fades into insignificance, or at least seems of much less importance. The eager interest felt in the big shows, in the meetings of the Rose or of the Chrysanthemum societies, awakes but a feeble echo now. The resting stage has been arrived at, and energy is being stored to break forth into full vigour next season. This being so, there is happity no necessity for doing more than allude to the ever-growing multitude of shows, with the expression of a passing regret that so much labour should be spent on ephemeral matters, and that the results are proportionately so small. Here and there we find something that is of more permanent value. We may include in the number the papers read at the recent Potato Tercentenary Conference in Dublin, It is curious to observe in passing that little or no notice seems to have been taken in Dublin of the similar conference held in London some few

most instructive of similar gatherings.

Another matter arising out of the exhibitions is the issue under the auspices of the Royal Horticultural Society of the "Rules for Judging." This attempt to lay down general principles is most laudable, and we trust that the experience gained in the past year may serve to show in what directions amendment or augmentation may be required.

years ago, which was one of the very best and

The most astonishing, and the most satisfactory, outcome of the societies this year is the resolution of the Shrewsbury Horticultural Society to creet a statue of DARWIN in the town of his birth. We have always looked on the Shrewsbury fete as one of the best illustrations of the provincial shows, and as such, very restricted in its influence on horticultural progress compared to the expenditure bestowed upon it. It is popular and does good service by affording an opportunity for meeting friends and fellow-workers, but is accompanied by adventitious elements more suited to a country-fair than to a society with earnest aims. In this, however, Shrewsbury is no worse than many other towns, and financial reasons may doubtless be alleged for the continuance of practices which every genuine horticulturist must look upon as out of place and unworthy the dignity of Horticulture. DARWIN derived endless facts from horticulture, and freely availed himself of the assistance of horticulturists, as our columns bear ample witness. It is then most satisfactory to find a provincial horticultural society taking the lead in the matter of commemorating the life and labours of the great naturalist. We understand that the Shrewsbury Society has invited a deputation from the Royal Horticultural Society to visit the show in August next.

The Royal Horticultural Society has gone on its way smoothly, and we hope prosperously. The Drill Hall is certainly not all that can be desired as a meeting-place, but it is convenient, and we do not see much chance of amendment. Chiswick has been well maintained throughout the year, and the new Superintendent has gained the good opinion of the Fellows for his ability, tact, and courtesy. Incidentally, let us hope that the authorities will afford us the opportunity of visiting Chiswick next year. It is beside the question in these busy days to tell us that the Gardens are open daily; some special opportunity must be afforded, or most of us will be too immersed in affairs to be able to visit the garden, although we may still feel that the garden and the library, together with the committees, form the very marrow of the Society, so far as its utility is concerned.

Of Mr. Wood's grandiose scheme for federating all the horticultural societies and giving them a home, we have nothing but sympathy as far as the general principles are concerned, but we feel grave doubts as to the possibility of its full realisation. There is no reason, however, why some parts of Mr. Wood's scheme may not be carried out, and we carnestly hope that something practical may in due course be evolved from it. The want is universally felt, and that being the case, it seems cortain that a means of supplying it must shortly be devised. In the meantime, Mr. Wood's scheme is a very useful one as affording a basis for discussion.

Kew progresses in a way which makes a Briton proud. The cultivation of the plants is kept at a high standard, and the amenities of the garden are yearly increased. It was fitting that Kew should be one of the first places in which the noble Camoensia should flower. The very first place, however, was at The Mythes, Tewkesbury, last year. Now that it has flowered in a few other places, as with Mr. WOODALL of Scarborough, and Mrs. WINTHROP, Hungerford, we may expect to see it elsewhere. Kew has always from the time of Sir WILLIAM Hooker devoted much attention to the resources of our colonies and dependencies; and Dr. Morris in our own days has given special attention to this department. No better or more experienced adviser than he could be found to take part in the enquiries and deliberations of the commission appointed to consider the state of affairs in the great sugar-growing colony of British Gniana, which is suffering like some of the West Indian islands from the mischievous and illogical procedures of those foreign governments who deem it right to encourage one class of the community at the expense of all the others by their system of contributing bounties to the growers of Beet for sugar.

While mentioning Kew, we may allude to the publication of the useful handlists of trees and shrubs and other plants; and we have elsewhere alluded to the completion of the vast Flora of British India, and to the renewal of energy in the publication of the Flora Capensis.

Of books of permanent interest published during the year, the number has been large and the quality creditable to horticulture (which

we are serry to say has not always been the case). In addition to the works already mentioned, Professor Sargent's noble Silvet of North America progresses with remarkable and most laudable regularity. Miss Woolward's useful Monograph of Masdevallia has been completed. Mr. FREEMAN MITFORD has enriched our literature with a charming book on the Culture of Bamboos as Ornamental Shrubs. Mr. J. H. Veitch has furnished us with a sumptuous reprint of his Travellers' Notes, which will form a valuable work of reference on Colonial and Indian gardens. We have not space to mention many foreign works, but we must not omit to allude to the Hortus Boissieranus of MM. AUTRAN and DURAND, one of the most extensive and carefully compiled garden catalogues that exists; to the similar publication issued by M. MARC MICHELI, entitled Le Jardin du Crest; and to the numerous publications of Professor BAILEY, of Ithaca, New York, in which the teachings of evolution are brought to bear on the practice of horticulture in a way that is most interesting, and promising of good result.

Of new introductions in the way of plants, the number has not been large. Even among Orchids the greatest additions have been made in artificially raised bybrids. Perhaps many of these will be as evanescent as the hosts of new Chrysanthemums. We shall give a review of the new plants of the year in our next issue.

Among matters of vital interest to market gardeners and commercial horticulturists, are the reductions that have been made by some of the railway companies in their rates for the carriage of goods; and the triumphant efforts of the Nursery and Seed Association to ensure an equitable adjustment of the rates payable on premises used for business purposes. The "Worthing case" so often referred to, has been upheld everywhere; but to this matter we must refer on another occasion.

One by one the workers in our little Cosmos falls away. We mourn their loss, but we feel they have not lived in vain, and we are comforted by the reflection that their teachings and their influence will be beneficial on the new generation growing up. A glance at the in lex will show that the obituary list is sorely beavy. We have lost Anthony Waterer, a fine representative British horticulturist; ROBERT WARNER'S decease it falls to us to have to record in the present number; and then we have lost such practical gardeners and amiteurs as William Brockbank, W. E. Baker, GEORGE PRINCE, BRUCE FINDLAY, Sir JULIAN GOLDSMID, Rev. CHARLES FELLOWES, and many others. Botany has sustained a very severe loss in the death of the indefatigable Baron VON MUELLER; in the loss of HENRY TRIMEN, so dear to his friends and colleagues; and in that of MARMADUKE LAWSON.

The mention of a few of our friends who have gone before reminds us of our duties to these still among us. Some of these need our help, and need it serely. May we not, then, wind up our brief notice on the events of the year by an earnest appeal on behalf of our gardening charities, the Gardeners' Royal Benevolent, which is more than a charity inasmuch as it is an institute of self-help; and the Gardeners' Orphan Fund, which is a real charity. Both funds have been well conducted during the year, but they greatly need extended help. The inauguration of the sixtieth year of HER MAJESTY's benign and brilliant reign surely affords a good opportunity for helping the poorer of her subjects.

Fig. 141.—DISA PCLCHRA. (SEE P 775) s, sepads; sr, spun; rr petals crossing at the tips; $\iota_{\rm c}$ lup; $\cdot_{\rm T}$, stance, with respect to makes; $\sigma_{\rm c}$ overly.

Why should Misleto vary when Misleto growing on the same tree under apparently like conditions? The answer is not easy, for here we have the same species, and little or no cross-breeding is possible, and of course, absolutely no hybridisation. The nutrition is not changed to all appearance; the "environment," as Mr. Henslow would call it, is, so far as we can see, identical. Why then should the Misleto vary? Some will ask does it vary? To this the answer is yes, considerably, even on the same plant. In former years we published several illustrations, showing a considerable range of variation, and now before us lie specimens kindly sent by Mr. JUSTUS COR-DEROY, some with twigs as thick as swan-quills, leaves 3 inches long and upwards, and nearly 1 inch in breadth. These leaves are in pairs, Then we have others much smaller in all their parts, but the most curious is one in which the leaves are in whorls of four, and what is more singular still, in threes. The branchlets bearing these whorled leaves are compressed and flattened as if fasciated; on cross-section, they are of elliptic outline, and there is a broken ring of vascular cords not yet consolidated into a central cylinder.

Mr. Corderov tells us that there are two plants of it, one of younger growth having been ent out some years ago to get rid of it, but "it came again."

The specimens sent are both growing on the same tree, Pyrus spectabilis, but on opposite sides of it.

OUR ALMANACK. -Secretaries of Horticultural Societies and others, are earnestly requested to forward immediately, the dates of Show Fixtures and of Moetings of Botanical and Horticultural Societies of any kind for 1897, for insertion in the Almanack, to be published in our next issue, on January 2.

SILVER WEDDING CELEBRATION. At the Drill Hall, Wordsley, on Tuesday evening, 15th inst, the silver wedding of Mr. and Mrs. Edward Webb, Stourbridge, was celebrated. The employes of the firm presented the happy pair with a massive and costly silver bowl and a pair of claret jugs.

CONCERTS AT ALTRINCHAM -- The annual concerts in aid of the Gardeners' Royal Benevolent Institution and Royal Gardeners' Orphan Fond, given un ler the auspices of the Concert Committee of the Altrincham and District Gardeners' Improvement Society, took place on the 1st and 2nd inst., in the Literary Institute, Altrincham, A most attractive programme of vocal and instrumental music was provided each evening, and on both occasions the large hall was well filled with an aptreciative audience. After paying all expenses, the balance left is £62, which the coamittee propose to divide as follows .-£31 IOs, to the Cardeners' Royal Benevolent Institution, and £30 10s, to the Royal Gardeners' Orphan Fund. This is the fifth season of these concerts in Altrischam, and the total amount raised by the committee now reaches £220, a result far beyond our expectations. I am sure Mr. BARRON and Mr. INGRAM, the esteemed sceretaries of the respective societies, would gladly welcome similar achievements by gardeners in other districts throughout the United Kingdom, Ches. Hewitt, Hon. Sec. und Treusurer.

THE SURVEYORS' INSTITUTION.—The next Ordinary General Meeting will be held on Monday, January 11, 1897, when a paper will be read by Mr. Howard Martin Fellow), entitled "The Future Development of 'The Surveyors' Institution." It has been found desirable to alter the date of the annual dinner from Wednesday, March 3rd (the date given on the Kalendar), to Wednesday, February 24th. The dinner will take place at the Hotel Cecil.

THE ROYAL GARDENERS' ORPHAN FUND - A meeting of the committee was held on December 18, WM. MARSHALL, Esq, in the chair. The chief business of the committee was the selection of the candidates for election at the next annual meeting of the Fund, which will be held at Anderton's Hotel, Fleet Street, on February 19, 1897. Special donations were reported as having been received:—From J. J. Nelson, Esq., Chesterfield, £3 15s. 2d.; H. Herbst, Esq., Kew Road, Richmond, Box, £3 12s. 7d.; Shirley and District Gardeners' Mutual Improvement Association Concert, £2; Mr. G. Harvey, Stanton-in-Peak, Bakewell, 158; Mr. H. A. Burburry, Highbary, Birmingham, 17s.; Arthur Miles, Southampton, 11s. 2d.; Mr. F. Dodds, Herriogswell, Mildenhall, 10s. 6d.; Miss Forrest, Anderton's Hotel, £1 5s. A cordial vote of thanks was awarded.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL SOCIETY.—The annual supper in connection with this important society took place on Thursday the 17th inst. at White's Restaurant, Gla-gow. Mr. Donald M. Bean occupied the chair. It was stated by the chairman and others that the prospects of the society in the immediate future were exceedingly bright, chiefly on account of a much more suitable place for holding the society's great shows being secured.

THE RECENT EARTHQUAKE.-Will you allow me to ask the help of your readers in obtaining materials for a memoir on the recent earthquake. My object in this memoir is to trace as accurately as possible the boundary of the area over which the shock was felt, or the accompanying sound heard, and to draw lines on a map through all places at which the shock was of approximately the same intensity. It would be of great service to know simply the names of as many places as possible where the shock was felt, or the accompanying sound heard. Still more useful would it be to have answers to any of the questions printed below, especially to those numbered 5 and 6. I shall be most glad and thankful to receive accounts from any places whatever, and I may add that no careful account, however scanty the information given, can fail to possess some value, or to help in throwing light on the unture and origin of the shock -

- Name of the place where the earth-quake was observed,
- Time at which it was felt, if possible to the nearest minute.
- 3. (a) What was the nature of the shock?
 (b) Did the shock consist of two distinct parts, separated by an interval of a few seconds? (c) If so, which part was the stronger, and how long was the interval be tween the two parts?
- 4. How many seconds did the shock last, not including the accompanying sound!
- 5. Was the shock strong enough (a) to make doors, windows, firstirons, crockery, Λe, rattle; (b) to cause the chair, Λe, on which the observer was resting to be perceptibly raised or moved; (c) to make chandeliers, pictures, Λe., swing, or to stop clocks?
- 6. (a) Was the shock accompanied by any unusual rumbling sound; and, if so, what did it resemble! (b) Did the beginning of the sound precede, coincide with, or follow, the beginning of the shock, and by how many seconds! (c) Did the end of the sound precede, coincide with, or follow, the end of the shock, and by how many seconds!

-Char ex Davison, Sc. D., F.G.S. Secretary of the British Association, Scismological Investigation Committee, 373, Gillott Road, Birminghum.

BOTANIC GARDENS AND THEIR STAFFS.—As an appendix to the present volume of the Kew Bulletin, a list of the various official botanical institutions of this country and its dependencies is given

As might have been anticipated, the majority of the Indian and Colonial officials have been trained at Kew.

EXCHANGE LIST OF SEEDS.—The list of seeds of hardy herbaceous plants, and of trees and shrubs, available for distribution from Kex, has lately been published. These seeds are offered in exchange among other botanical establishments and regular correspondents of Kew, but are not sold to the general public.

BIRKENHEAD AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION. On Tuesday evening, the Sth inst., Mr. George Burden, of the gardens, Lingdale Lodge, Claughton, gave a lecture on "Chrysanthemums and their Culture," before the members of the above association, in the Y.M.C.A. Hall, Grange Iload, Birkenhead, before a good attendance of members.

SCOTTISH PANSY AND VIOLA ASSOCIATION.—The annual meeting of this Association was held in Glasgow on Friday evening, the 18th inst., Mr. WILLIAM CUTBRERTSON (of Messrs. Dobbie & Co., Rothesay), presiding. Mr. John Smellie, Busby, the secretary, submitted a report of the society's work for the year, which was considered most satisfactory. Office-bearers for the coming season were elected. The society holds several meetings during the summer to consider and award certificates to new and meritorious Violas and Pansies.

THE HORTICULTURAL MARKETS have during the past week passed through another period of uncommon activity. It has been our pleasure again and again to remind our readers at this recurring Christmas festival, of the importance that horticulture now assumes in relation to it, compared with earlier days in this century. There is a greater disposition on the part of the general public to avail itself of the fruits, vegetables, and flowers that are produced, and a corresponding effort is made by the market gardener to increase and vary his supplies. The activity that we have recently witnessed at Covent Garden Market, therefore, is something we always look for at Christmas, and never in vain. But we can easily sympathise with the stranger in his wonder at the abundance of products that pass through this centre of distribution, for few of us would have a comparative idea even, of the amount of decorative material that is used, or of the numbers and popularity of the time-honoured Christmas-tree, were it not gained from the market itself. In our issue for December 21st of last year, we went fully into the facts connected with "Christmas Horticulture," and enumerated the different kinds of flowers and fruits that can now be obtained from the market at mid winter. After earefully inspecting the supplies during the week just ended, we find little fresh to record. No new or novel features were noticeable, but a satisfactory supply of most of the articles of produce that are fast becoming indispensable. The autumn and winter so far have been neither uncom monly cold nor phenomenonally mild, and the gardener has forced his bulbs and other flowering plants, also his vegetables and salads, under conditions about average in character. There are still plenty of Chrysanthemums about, but it is probable that the supply will be a very different one after New Year's Day. The choicer kinds of flowers from hothouses are available in considerable quantity to purchasers whose means allow them to pay a remunerative price for them. Of truits there is an enormous supply, but the major portion of this is "imported." British-grown Apples are to be had, but the supply will soon be exhausted, nor is the quality of them so good as we could desire. Of course, we now speak of ordinary samples, for it must be remembered that there is a small reserve of the choicest fruits, and such will command a good price. We saw very inferior fruits of Ribston Pippin at 3d. per pound, and others of better quality a penny each. King of Toukins' County, fine fruits were marked at four for sixpeoce; and imported Newtown Pippins, threepence

each. Some fairly good Blenheim Orange Pippins were selling at four for sixpence. Of Pears, there are Glou Morceau a id Easter Benrré both in capital condition, but we failed to notice many samples of Winter Nells. Of course, the season of 1896 was not specially favourable to either Apples or Pears, and the weak supplies observable at the end of December are partly thus explained. Excellent Tomatos could be bought for ninepence per pound, and Mushrooms from 1s. 3d. to 1s. 6d. per pound. A presentable sample of New Potato tubers was marked 6d, per lb. The supply of Grapes appeared to be sufficient at prices ranging from 1s. 6d, to 3s. 6d, per lb. Gros Colmar, Muscat of Alexandria, and Black Alicante were the chief varieties. Finest samples of Walnuts were 9d. per lb., Brazils 8d., Chestnuts 6d., Cobs and Filberts 8d., and Small Nuts (d. per ib.

British Produce Supply Association, Limitrd.—A visit to Winchelsea House, Long Acre, revealed a large exhibition of British farm and gurden produce. Came and poultry of all kinds were present in remarkable numbers, save the well-known lark, the Association having so far discountenanced the slaughter of these, that it refuses to stock them. The great object of this Association is to bring the producer and consumer into immediate contact, and to so specialise British produce that there can be no possibility of foreign being substituted for it. Almost every county is represented by produce of one kind or another, and a very extensive British supply was provided for Christmas.

THE SUGAR-GROWING ISLANDS OF THE WEST INDIES.—The QUEEN has been pleased to appoint General Sir Henry Wylle Norman, G.C.B., G.C.M.G., C.L.E. (Chairman), SIR EDWARD GREY, Bart., M.P., and Sir David Barbour, K.C.S.L. to be Commissioners to inquire into the conditions and prospects of the West Indian Sugar-growing Islands; and Mr. Sydney Olivier, B.A., to be their secretary. Dr. Morris, C.M.G., Assistant Director of the Royal Gardens, Kew, will accompany the Commission as expert adviser in botanical and agricultural questions.

THE LOUGHBOROUGH AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

At the meeting of the above society held on December 15, in their rooms, Woodgate, Mr. J. SMITH occupied the chair, and Mr. A. J. WILLSHER, Gardener, Stanford Hall, read a paper upon "Winterflowering Carnations." The practical methods of cultivation were fully detailed, and several points respecting the cultivation of plants were discussed by the members present.

NEW PUBLICATIONS. - Everybody's Medical Guide. By M.D., London, (Saxon & Co.) As a rule, books of this character are apt to be untrustworthy and misleading, either because the reader is not sufficiently acquainted with the subject to be able to use the book with advantage, or because, in the attempt to be "popular," accuracy is sacrificed. There is a still worse category, that of "quackbooks "compiled for mercenary ends, largely advertised in one way or another, but which should be shunned like the plague itself. The present little book is among the best of its class, and a reference to it has shown that it has been carefully drawn up. Disinfection is, of course, frequently mentioned, butt in another edition a separate paragraph should bedevoted to it; and an explanation given as to the nature of " L. G. B. Soloids."

The Dairy Diary. (Beechings, 174, Strand.) A practical record book which will be very serviceable. The medical recommendations, however, it would be wise to ignore, and to summon the assistance of an expert when necessary.

Favourite Flowers (F. WARNE & Co.) continues to appear with exemplary punctuality. No. 14 is devoted to Roses and allied plants. The coloured plates of species are generally good—those of the florists' varieties are not so satisfactory. The

"popular" name "Syringa" should have been ignored. It does nothing but mislead. The seventeenth number of the second volume, ranging from Cotyledon to Willow Herbs (Epilobium), and including a coloured plate of Sedum spectabile, of Sedums Sieboldi and sarmentosum, of Sempervivum arachneideum, of Myrtus communis, of Punica granatum, and of Cuphæa ignea. We commend the work heartily to the notice of amateurs and plantlovers.

Elementary Geology. By G. S. Boulger, F.L.S. (London and Glasgow: WILLIAM COLLINS, Sons, & Co.) This is, we are told, a complete revision of Dr. DAVIS' "First Book of Geology," and is intended for the students of the Science and Art Department. We do not know of any book in which so much information is compressed into so little space. As a guide therefore to larger works, a companion in the lecture-room or the quarry, or as a reminder to the busy student, it will prove most useful. For use by itself, we should no more recommend it than we should give undiluted Liebic's extract to a patient with feeble digestion. Though so condensed, the style is lucid and facile, and, se far as we have tested it, accurate. Sets of examinationquestions, and an index, complete a little work whose utility is beyond dispute.

Live Stock Journal Almanae (Vinton & Co.) is a diary and journal specially suited to the wants of Stock-Raisers. In addition to tabular details, there is a large number of pleasantly-written articles on shorthorns, horses, and other farm animals.

Physique—Meteorologique.... Par Leon Dumas. (Huy H. Mignolet.) A treatise on cosmical physics and meteorology as applied to agriculture and horticulture. We shall revert to it on another occasion.

The True Grisses. By Eduard Hackel....... (Westminster: Archibald Constable.) A translation from the article on grasses in Engler & Prantl's Die Natürlichen Pflanzen Familien. This translation appeared in the United States six years ago, but it only now appears in an English guise. As the best general account of the order it is very welcome, but it is disheartening to find that "no single tribe, no large genus numbering over fifty species, can be definitely characterised." This state of things is just what the student of evolution would expect; but to the student of method it is cenfusing. Artificial or arbitrary arrangements must be used for practical purposes, sinco natural groups cannot be defined.

Université de Montpellier, Jardin des Plantes. Catalogue des tiraines Récoltées en 1896; it is berein requested that all applications for seeds should be made before February 15 next.

Notes upon the Flora of Newfoundland. By B. L. ROBINSON and H. YON SCHRENK. A useful publication, giving brief mention of prominent explorers and botanists, of the features of the country, and of the phrenogams and vascular cryptogams secured on the island.

Journal of the Board of Agriculture. The third (quarterly) volume for December contains, amongst various other papers, one devoted to Injurious Insects and Fungi. It treats of the Army Worm (Leucania unipuncta), Woodly Aphis or American Blight, Corn Meth, a Lily Disease, a Disease of Snowdrops, Narcissus Fly, Smut of Brome Grass, and Hop Mildew. Brief life-histories of these pests are included, as well as directions as to how best to cope with them.

Hardy Coniferous Trees. By A. D. Webster. (Hutchinson & Co.) To this we shall have to advert more fully later on. The Gloucester Diary.— Finton's Agricultural Almanae.— Richensee Castle (Geneva, Haussmann).—True Till Death (A. W. Hall).—Mothers and Daughters.—Confidences of on Amateur Gardener (Seeley & Co.).—Catalogue des Graines, &c., Museum & Histoire Naturelle (Paris, Rue Cuvier, 57).—Special Christmas number- of the Garleners' Mayarine (excellent), Sgraps, Surp-

shots, Nuggets, The Weekly Budget, from the publishers, Red Lion House, Red Lion Court, Fleet Street, E.C.

INDOOR DECORATIONS AT THE CHRISTMAS SEASON.

WE owe largely to a mild, and on the whole, a favourable autumn, the preservation of the berries in our shrubberies and hedgerows, for they are still sparkling and plump, and capable of being employed in many ways for house-decoration at the Christmas season; and although the Chrysanthemum appears to be preserved to us longer than usual, the blooms are only in the possession of comparatively few. and flowers being in brisk demand at the Christmas season when they are fewest, they command good prices. It is well then that the outdoor garden can furnish something attractive in the way of foliage and berries to take the place of flowers; and with these can be used some of the dried and dyed treasures of the horticultural sundriesman, such as grasses in great variety, the noble plumes of Uva, Pampas, &c., and the stately Bulrush, the clever imitations of hardy evergreen berried plants, and various preserved flowers. Effective as many of these dried and dyed examples of foliage and flowers are, the natural products of our gardens are to be preferred where they can be obtained in sufficient variety and abundance.

Among these latter, berried plants are probably more plentiful than is generally supposed. The Holly takes the lead, their crimson and yellow berries in combination with their leaves are highly effective, and lend themselves to all sorts of combinations; while the leafy sprays, green and variegated with much diversity of leafage, are scarcely less valuable. Cratiegus coccinea, where the fruit has been allowed to remain on the trees; the crimson berries of the common Hawthorn, which are very abundant this season, with the more coral-tinted ones of C. pyracantha, are acceptable helps to the indoordecorator. These can be gathered in clusters and wired so as to make them prominent subjects in a basket or bowl of foliaged and berried plants. The hips of the Dog and other Roses, and the large and prominent fruit of the Japanese Rosa ragosa. where the birds have spared them, are valuable

The common Privet furnishes clusters of purple, almost black, berries at this season of the year, and they can also be wired, for in all combinations of foliage and berries, the latter should be made as prominent as possible, and need elevating on wires or some substitute for it. The bright-red berried Skimmia Fortunei is very showy, and as they can be gathered in bare clusters, the plant being of slow growth, it is well not to demide it too much of its foliage.

The Pernettyas are charming berried plants, and especially the new varieties from the north of Ireland, which do not appear to be so much grown as they so well deserve to be; but the old P. mucronata can be found in many gardens to which the new forms have not yet been introduced. In favourable positions the Myrtle will sometimes produce its purple berries, but their production is not of common occurrence. On the Snowberry tree (Symphoricarpus) the large fleshy-white berries can, when the autumn is mild, be gathered at Christmas; and Garrya elliptica, when furnished with its long slender pendulous catkins, is almost indispensable to an effective arrangement.

In the way of foliage there are the forms of the Green and Golden Cypress; some of the choicer Conifere furnish handsome sprays, rich in the promise of catkins. The Aucuba is one of the handsomest of our hardy evergreen shrubs, some of the varieties of the common type have handsomely maculated leaves, the berries are yet green; they begin to colour in February, and by Easter are ruddy with colour, and of service in the decorations at that festive season. The Spruce and other Firs are useful for furnishing sprays, and the former supplies us with the traditional Christmas tree.

Berberis Darwini supplies evergreen shoots which are effective in baskets; but Mahonia aquifolium furnishes leaves of a bright bronzy line, invaluable in combination. Ivy, both green-leaved and variegated, are excellent for furnishing the bandles and rims of baskets, the small-leaved types to be preferred; and such of the berries as remain have a decorative value.

Where Aralia Sieboldi and its variegated form will stand the rigorr of our English winters, its bold leaves are useful, so are those of Escallonia; the large shining evergreen leaves of E. macrantha are even more glistening in winter than in summer. Lenicera aureo - reticulata will sometimes furnish bright golden festoons in winter; Osmanthus ilicifolius variegatus has handsomely variegated Holly-like foliage. It should be mentioned that the Retinosporas furnish elegant plumose sprays, green and variegated.

Of hardy-growing plants, blooming in the open air at Christmas, we have but few. The naked-flowering Jasminum is one of the best; just now it has many expanded yellow blossoms, especially when against a south wall. Then there is Viburnum Tinus, and its large-flowered form, lucidum, a plant which never fails to bloom at the Christmas season, as if defying the terrors of winter; and where Chimonanthus fragrans will flourish, it should have the protection of a south wall-and where, mid frost and snow, this winter loving bush will produce its Jonquil-scented flowers in abundance. What can be more acceptable on Christmas Day! Erica carnea will put forth its abundant pinkish flowers at mid-winter, where it thrives in a peaty spot. The Witch Hazel (Hamamelis) will produce its numerous and somewhat rich yellow flowers from October to March, and they are effective in various ways. Lardizabala biternata in an exceptionally favourable position, such as a warm wall, is a very fine evergreen climbing plant, producing its purple flowers in drooping racemes at Christmas, but it is seen at its best when planted out in a cool conservatory.

There is thus no lack of material for such purposes if such be available, as at this season of the year foliage and berries will remain fresh for many days, gilding the dull portion of the year with some touches of attractiveness. R. D.

A MEDICINAL MISLETO.

Your correspondent's (W. W.) notes some time since regarding a medicinal Cactus, a native of Texas, Mexico, recalls to my mind certain information which I gathered from a very intelligent native some years ago regarding a species of Misleto indigenous to the same region, or at any rate to Arizona and the adjoining Mexican district of Sinora. While riding down one of the valleys debouching isto the Sinora River. I noticed that two forms of Misleto grew very thickly on the Mesquite (Acacia) trees, which are very plentiful in many places. One species was not very much unlike our native form, but in the other the leaves were almost entirely aborted, and the plants appeared like bunches of long pendulous stalks, profesely covered with small knots, which I believe were the inflorescence. The two forms grew indiscriminately together on the same trees, and in such abundance that they sometimes far exceeded in quantity the natural foliage of the host-tree. Making some remark about this growth, the Mexican riding at my side told me that it constituted a powerful native remedy for coughs and chest complaints, but had to be used with care, as its effects were so marked. To use it, the plant was dried and smoked in the form of cigarettes, the fumes being drawn into the lungs by inhalation once or twice only, when immediate relief was experienced. He did not draw any distinction between the two forms, and I understood his remarks to relate to both. I have since greatly regretted that I did not collect specimens and bring them home; and, indeed, on my return I wrote to a person who was with me at the time to send some material, but circumstances occurred which prevented this. There would, however, be no difficulty in obtaining a supply, should any of your readers have connections in the region

indicated, and hence I have thought it might be of interest to mention the fact, as I have found no reference in botanical works to medicinal virtues of the nature possessed by this family of plants, and it is quite possible a valuable reme ly might repay the trouble involved. A third form of Misleto I noticed, but this had larger and blunter leaves than ours, and is hence very different from the species in question.

With reference to the mescal spirit alluded to by your correspondent, its use is by no means peculiar to the Apaches; it is the "whiskey" of Northern Mexico, with the reputation of leaving no head-ache as a sequel to excess. It is quite colourless, and very strong. There are plenty of stills scattered about the country, and donkeys (burros) laden with the huge pine-apple-like masses of the trimmed Agave roots, or rather root-stocks, are frequently met with, and their produce, the spirit aforesaid, is sampled alike by native and fore gner without a thought of the common foe, the wily Apache, now happily shut up far away in his own particular Government reservation, except when a little knot of young braves break out in a vain attempt to revive their fathers' unenviable reputation of scalp-hunters and demons in gen ral. Chois, T. Drucry, F.L.S.

NOTICES OF BOOKS.

THE NATURAL HISTORY OF THE ANCIENTS, by Rev. G. M. Watkins, M.A. (London: Elliot Stock.)

The author of this book seems to be ignorant of the fact that a few years ago a book on the same subject was published so very like his own, that it seems impossible that he can have seen it. The book was entitled The Natural History of the Ancients, by the Rev. W. Houghton, and in the size and binding of the book, in the arrangement of the subjects, and very much in the way in which the different subjects are treated, the two books are much alike, Houghton's was an excellent little book, with a few good illustrations from the old monuments; and Mr. Watkins' book may also be fully recommended to all who wish to know something of the connection between our present wild and domesticated animals and those of the ancients, and something also of the connection between our gardens and flowers and the Roman and early English gardens. On this last point, Mr. Houghton's book says nothing, because he confined himself more closely to the animals, and because be did not use the term "ancients" in the same loose way that Mr. Watkins does. With Mr. Watkins, the term "the ancients" comprises all the time between Homer, or even Adam and Eve, and the last century : for he gives at full length not only Chancer's accounts of his gardens, but Milton's account of Paradise and Addison's of the gardens of his day. He has three chapters that the gardener will naturally turn to, the chapters on "Gardens," on "The Romans as Acelimatisers in Britain," and on "Roses." The chapter on "Gardens" has the usual accounts of the gardens of Homer, Alcinous, the Romans, Pliny, &c., and then comes down through Chancer, Bacon, and the ars topiaria to our own day, in which "we see a decided revolt from the tyranny of ribbon beds," and "the effects of geometrical gardening and lines of beddingplants," and in none of these points is there anything new, though much, perhaps, that is interesting. On the second subject, "The Romans as Acclimatisers in Britain," Mr. Watkins gives rather a confused account. He seems to think that all the Italian plants now grown in England were introduced by the Romans who conquered Britain, and so he credits them with the introduction of the Laurel, Myrtle, Oh ander, &c.; and more than that, he gives them the credit of introducing the Filbert, and of importing, not only the so-called Roman Nettle, the history of which, as given by Camden, is very doubtful, but even says that they imported the two other British Nettles, which are undoubtedly indigenous. Nor can we say much more of his chapter on "Roses." The old stories of the Greek and Latin Roses are introduced, followed by the Ro es of Chancer, and

then, by the mistaken statement that Shakespeare's Roses were nothing but "Roses which blossomed on the hedges by the Avon," "the wildings of his own country lanes." He would find it difficult to gither in those lanes Shakespeare's 'Red Rose," "Provençal Rose," "Damask Roses," "Rose Red and White," &c. Of the chapters devoted to animals we say little, wishing to confine ourselves to those on flowers; we will only say that he adds lit; le or nothing to what had been already well said by Mr. Houghton and by Miss Phipson in her excellent Animal-low of Shakespeare's Time. Still with all its defects, Mr. Watkins' book is a scholarly book; and if it could be re-east and rearranged with some attention to keeping more close to the subject, and especially to the natural history of the ancients only, the book would have its uses.

THE PLANT-LORE AND GARDEN-CRAFT OF SHAKESPEARE. By Henry N. Ellacombe, M.A. New edition (Edward Arnold).

There are various reasons which in luce us to derote more space to the present book than we can usually do to new editions. In the first place "It's Christmas," and our readers will, we hope, find themselves in the enjoyment of a little well-earned leisure. We can assure them they will find no more pleasurable, no more satisfying recreation of the kind than the perusal of this new edition of the plant lore. Of one thing we may warn them, and that is not to take it up when time is an object, or work has to be done. The reader will find it so fascinating that he will read on, turn over page after page, and put down the volume with regret when forced to do so. In the next place, the present edition is enriched with numerous wood cut illustrations, many of which add to the interest of the volume, particularly those relating to Shakespearean localities and Elizabethan gardens. The illustrations of the plants are accurate, especially when their small size is considered. While admitting the general interest and accuracy of the illustrations. we are a little disposed to regret that their presence his entailed the omission of a delightful article on the Drisy, of another on the seasons of Shakespeare's plays, and of the list of plants mentioned by Shakespeare and his contemporaries. If it were not so very uns asonable, we think we should indulge in a grumble over these omissions. They are enough to make a critic turn fractions, and to ask, for instance, why the Cellars at Warwick Castle and the Stane Pine are introduced why "the Globe Artichoke is considered a near ally of the Eryngium," as it is not, except, perhaps, at Christmas time

What the gardens of Shake-spearean times were like may be gleaned not only from Canon Ellacombe's pleasant pages, but also from the excellent account of the Elizabethan flower-garden to be found in the Hon. Miss Amherst's history of gardening in England. It was formal, and if carpet-hedding had been invented at that time, no doubt it would have found favour. In any case, the gurden of those days was in harmony with the architecture of the house, and that it did not prevent the appreciation of the beauties of woodland scenery is obvious enough from the references in such plays as As You Like It, besides, did not a writer in the very first volume of the therdeners' Chronicle, in 1811, undertake to prove from his writings, that Shakespeare was neither more nor less than a gardener ' See Gardeners' Chromic'e, 1841, pp. 135, 183, 349, 137).

HOME CORRESPONDENCE.

HORTICULTURAL INSTITUTE.—Mr. Wood will soon have an opportunity to learn how fur his proposals are likely to meet with pecuniary support; there are so many very enthusiastic people in the world whose sentiment, however, stops short at the breeches pocket. Why does not some one suggest that horticulture ent r into partnership with the Imperial Institute. There is a big building wanting employment, and so far, though

floated with far greater colat than Mr. Wood's bantling will ever obtain, yet it is practically a failure. Why not make that white elephant a "Home for Horticulture?" If the site for Mr. Wood's erection is not to be found at South Kensington, then where? Certainly not on the Thames Embankment, or in Hyde Park. Millions of castles, palaces, institutes, and homes, have been built in the clouds, but soon all have dissolved, and, like baseless fabrics of visions, left no wrecks behnd. Is there any better fate in store for the newly-designed castle for horticulture, or is there yet in the background some horticultural Henry Tate who will find the needful thousands? Here is a grand opportunity for some millionnaire to secure immortality. A. D.

--- Will you allow me toold to my former letters — Will you allow me to a id to my former letters upon the above subject, a few further remarks upon finance. It is desirable to create and foster interest in every department of the hortientural community, the trade, the employers of labour, the gardeners, the amateurs, and the cottagers. As I have already stated, the Rose and other final fortieds built about the middle of June as pear the festivals held about the middle of June (as near the 20th as convenient) would in my judgment be a most appropriate occasion in which all could take part. The trade, I would suggest, who derive their income from the gardening body, might take the initiative, and subscribe say £1000 to be distributed in prizes to those societies who would be represented by a life governor or an a-sociate. If their co-operation can be obtained for carrying out my scheme. I shall be pleased to offer £100 towards this fund, and believe another £400 would be forthcoming from four other firms. Surely amongst all our large and wealthy rade community ten other sums of £50 each can be relied upon, thus making £1000. The assistance of gardeners might be solie.ted (through the post), collecting eards being sent to them, prizes being offered for the largest amounts so collected; collectors might also ballot for a certain number of their fellowcollectors to be elected as associates without payment, thus ensuring a thoroughly representative council, also all collectors of over £2 should be entitled to a free mombership for the first year, with all its privileges. Amateurs and cottagers would, it is confidently ant cipated, respond to a special appeal by the Horticultural Press, particularly if the papers would receive donations and acknowledge them in their colunn : I offer these suggestions entirely because no one else appears to come forward with a definite scheme worthy of the eccasion. The forthcoming event is too important to pass unnoticed. Clebrations and festivities of all kinds will be held all over the Kingdon, shall horticulture he silent! Will the Royal Horticultural Society will the Royal Rollectural Society kindly consider these suggestions? They are not made with the idea of forming a rival instinction, but of establishing a home in which all interests should be united, and the Royal Horticultural Society would naturally be the head of it. Will they therefore take the lead? James L. Wood, Oakleigh Park, II hetst me.

- - I should like also to mention that I think Mr. J. L. Wood should be encouraged to proceed as he suggests, with all speed, to endeavour to provide a Horticulteral Institute. I shall certainly be a member. The prospect of having a specially built place in which shows may be held with dignity and elegance is entrancing, and worthy of a special effort. C. Houle Woodley.

— Now that Mr. Wood has given us his plans and ideas for the promotion and formation of a "Home of Horticulture," I beg to suggest one or two ways in which the Royal Horticultural Society could help in raising funds to provide the necessary expenses of such a home. I propose that the Royal Horticultural Society send a subscription cand to each of their 3000 Fellows, and duly authorise them to raise subscriptions in their districts from gardeners, nurserymen, and all others interested in horticulture, such cards with subscriptions to be returned within one month from date of receiving them. The expense of printing cards, &c., to be deducted from subscriptions. The balance (which should be a good one), to be handed to the trustees of the Home of Horticulture, J. D. Robertson, F.R.H.S., South-Eastern College, Rumspate.

Vour issue of December 19 contains a well-thought-out plan in reference to a Horticultural Institute, which, no doubt, will find many admirers in the world. Mr. Wood says it can be made a success, and he also uses the old expression, "United we stand, divided we

fall." In that one sentence lays the whole thing. For my part I do not believe gardeners will stand together for such a purpose; and again, will the benefits derived from such a course justify such an action? I think not. No doubt it would be patronised by gardeners in or near London, but not so by those living at a distance, for even if some thought they could derive an advantage by attending, the expense would be too great, without taking into consideration the question of time. Again, the majority of gardeners are connected with a society near their residence, and all are well aware how some anxious times come to them connected with such a thing as a small village show; in fact, there are few such shows that work on purely horticultural lines that one can term prosperous. Take the attractions which are not horticultural away from such a prosperous show as Strewsbury, and where would it be in a few years? My opimon is that an horticultural institute, such as is described in the Gardeners' Chroniele, will not succeed in Great Britain, and gardeners generally will do better to think out something else to commemorate the sixtieth year of Her Majesty's reign. E, W,

it and reach to the seeds. Hence it is known when the seeds are ripe, by the rattling of the capsule when it is shaken. The pulp has a sweet and not unpleasant taste, with a slight acidity; it is sucked and eaten raw by the natives. The seeds are about 25 in number, when fresh they are of a flesh-colour; gathered before they are ripe, they are preserved in ugar, and thus they are very grateful to the palate. They quickly lose their power of vegetation, if taken out of the capsule; but kept in it, they preserve that power for a long time. The tree bears leaves, flowers and fruits all the year through; but the usual seasons for gathering the fruit are June and December. In two years from the seed it is above 3 feet high, and spreads its branches, not more than five of which are suffered to remain; before its third year is complete it shows for fruit. One tree yields from 2 to 3 pounds of seeds annually. These seeds are remarkably nourishing, and agreeable to most people, which eccasions them to be kept in most houses in South America as an ecessary part of the provisions of the family; they are generally ground or pounded very fine, a little anatto added, and made into paste—they are much charged with oil, but mix well with milk or water, and

the very best thing they can do is to cat Apples just before going to bed. The Apple is excellent brain food because it has more phosphoric acid, in an easily digestible condition, than any other fruitknown. It excites the action of the liver, promotes sound and healthy sleep, and thoroughly disinfects the mouth. It also agglutinates the surplus acids of the stomach [/], helps the kidney secretions, and prevents calculus growth; while it obviates indigestion, and is one of the best preventives of diseases of the throat. Next to the Lemon and Orange it is also the best antidote for the thirst and craving of persons addicted to the a'cohol habit. J. J. Willis, Harpenden.

PEAR BEURRE DU BUISSON.—In reply to Mr. Woodward (Gardeners' Chronale, p. 768), I have pleasure in supplying the information he desires. This variety is probably of French origin, grafts having been sent from France several years ago to my predecessor, the late Mr. W. Ingram. It is the best flavoured Pear that I know of for use after Marie Louise and Doyenné du Comice are over, and the fruits grow to a good size under favourable circumstances, reaching to 4 inches in length and

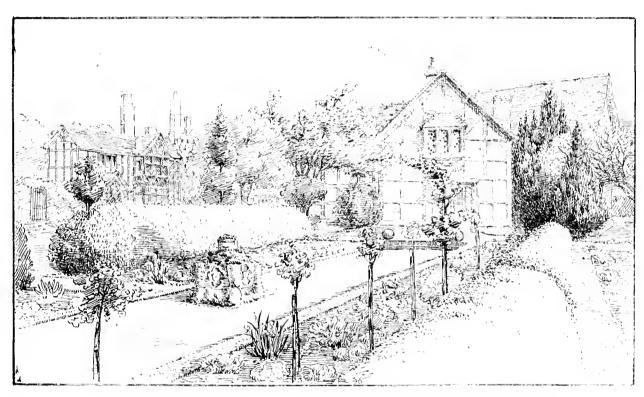

Fig. 142.—The garden at the rear of shakespeare's house, stratford-on-avon (see p. 788).

CATCHUP.—In the Gentlemen's Magazine Library, Part 4, a Mr. T. White, writing in 1789, describes the opening of the leaden coffin of a presumed Knights Templar in Danbury church. He writes:—
"The lid of the shell being carefully taken off, we were presented with a view of the body, lying in a liquor or pickle, somewhat resembling Mushroomeatchup, but of a paler complexion, and somewhat thicker consistence. As I never possessed the sense of smelling, and was willing to ascertain the flavour of the liquid, I tasted, and found it to be aromatic, though not very pungent, partaking of the taste of eatchup, and of the pickle of Spanish Olives," W. G. Smith.

THE COCOA TREE.—Theobroma Cacao is a tree which grows in a very handsome form to a height of 12 or 16 feet; the trunk is upright, and about as high as a man before the head spreads out. The wood is light and of a white colour; the bark brownish. Leaves lanceolate, oblong, bright green, quite entire; flowers small, reddish, inodorous. Fruits smooth, yellow, red, or of both colours, about 3 inches in diameter; riod fleshy, near ½ inch in thickness, flesh-coloured within; pulp whitish, the consistence of butter, separating from the rind in a state of ripeness, and adhering to it only by filaments, which penetrate

are formed into rolls of one pound each. The simple preparation of chocolate is the most natural and the best. It is in daily use amongst most families in Jamaica, where the tree is largely cultivated, and affords a nutritious food for children, as well as adults. Cocoa is a simple preparation from the cocoanut, or from the shells of it, or from a mixture of both. It is considered much easier of digestion than chocolate, and very nourishing. Theobroma species thrive in our stoves in light, rich soil; entings root in sand under glass. Seedlings of this very important plant I received from the West Indies. M. Brusman, Hortus Plantarum Diaphorocoum, M.deleland, Holland.

APPLES AS FOOD.—The Apple is the most valuable of all our home-grown fruits, being richest in sugar and albuminoids. The juiciest varieties are the most digestible, but the mealiest are the most untritious. Thoroughly masticated, digestion begins immediately, but some persons cannot cat them uncooked as a dessert. The Apple contains more of the element phosphorus than any other fruit or vegetable. A German writer thus discourses on Apples as food and medicine. The Apple is such a common fruit that few persons are familiar with its remarkably efficacious medicinal properties. Everybody ought to know that

24 inches in diameter, without any special method cultivation. The shape is obtuse pyriform; colour of the skin pale greenish-yellow on the shaded side. sometimes marked with red where exposed to the sun, the whole surface more or less covered with russet spots and veinings: eye, partly closed, set in a shallow depression; stalk, thick. \(\frac{1}{2} \) to \(\frac{1}{2} \) inch in length, sometimes obliquely inserted; flesh, white melting, and juicy, with a delicate arour. It has the great merit of keeping in good condition for a considerable period of time after it ripens. The tree bears freely at Belvoir on the wilding stock, both on an east wall and as a pyramid in the kitcheu garden, the fruits from the latter being only slightly inferior in flavour to those on the wall. On referring to the Royal Horticultural Society's report of the Pear Conference in 1885, I find that the variety was exhibited on that occasion, and I know that it has been in the hands of some of our leading nurserymen for several years. I mention this fact to show the length of time it takes for a first-class fruit to get into general cultivation. It received an Award of Merit from the Royal Horticultural Society in November, 1895, which is only partial recognition of its merits. It is classed as a January Pear in the Report of the Pear Conference, but I consider the month of December would be more correct, as I find it usually commences to ripen

about the middle of November, and to-day (Dec. 18) the last two fruits of it that we possess are fully ripe. W. H. Divers, Belvoir Custle Gardens, Grantham.

POTATOS AND PEAS .- I am very grateful to your reviewer for a kindly notice of my little book on "Vegetable Culture;" but even he must have his "Vegetable Culture: but even he must have little fling, and advises pruning of the Potato and Pea list. Now, no unfortunate author who undertakes the preparation of the smallest books can hope to escape not merely criticism, but very diverse criticism. That has been my case, for I have been told in various directions either that my selectious of the above terribly varied vegetables were too limited, or else that I did not include some varieties others regarded highly. Now I am taken to ta-k for selecting Potatos out of hundreds of varieties about two dozen-a great display of moderation, which all garden anthors do not adopt; and of Peas, about twenty varieties out of perhaps 150 or more. if I give selections of white Potatos, all widely grown, why not include a few coloured ones, for I have no prejudice against colour in Potatos, neither do I find have myriails of cottagers or allotment-holders. As to applying to these coloured varieties the invidious term "exhibition tubers," or indeed to any Potato varieties, it would be just as wise to regard certain Apples and Pears as unworthy general culture because so favoured, and "do beautiful for showing Some of the very best cropping and eating Potatos in cultivation are the best for exhibition. As to Peas, having given selections of dwarf and medium height varieties, why not give also a few of the best tall ones. There are gardeners of every class who still like them; and I did but indicate a few good ones for those who do, whilst undoubtedly the medium height section is the most serviceable generally. With these varieties come first, and here I should include Senator, Magnum Bonum, Boston Unrivalled, and the Gladstone, all first-class. A. Dean,

SOCIETIES.

MEETING OF THE BRUSSELS ORCHIDEENNE.

Discussing 13.- At the meeting held on the above date there was shown a plant of Vanda gerulea with a fine truss of ten large deep blue flowers, from M. Florent Pauwels, which obtained a Diploma of Honour per acclamation. There were also two good plants of Cattleya labrata, with dark flowers much streaked with blacy-rose, from M. Van Wissenhove: the lip of one variety was of an unusually dark purple colour ing and sating. A Diploma of Honour a Panonemite was awarded. I should add that the greater part of the leaves and scapes were spotted with claret colour, which suggests that the stripes will be regularly produced. Very pretty were Miltonia vexillaria, from MM. LUCIEN LINION ET CIE.; Cypripedium Donatianum nigrum (Hurrisianum - Wroti), from Dr. Van Carwelaure: Odontoglossum cuspum, with large brick-red spots on the sepals and smaller ones on the p tals; Oncidium Phalenopsis, from MM. LUCIEN LINDEN ET Cie., who showed twenty well-varied examples of Cypuipedium montanum, as well as an Odontoglossum resembling equally O. luteo-purpureum and O. sceptrum. M. PAI WELS sent also a fine variety of Cypaipednum Charlesworthi, with a large well-coloured standard; l'Horticulture Internationale showed Cymbidium Mastersii; and from the royal gardens at Lacken came Cattleya labiata, delicate in colouring—a fine truss cut by Princess Clémentine.

ROYAL HORTICULTURAL. Scientific Committee.

DECEMBER 15.—Present: Dr. M. T. Masters (in the chair); Dr. Bonavia, Mr. Michael, Rev. W. Wilks, Rev. G. Henslow (Hon. Sec.).

Primale sciencis and Hybrid—Mr. E. Hyde of Ealing exhibited at the meeting held on November 23 three fine plants of P. sinensis, raised from an originally wild plant. They closely resembled drawings of this species when first introduced about 1820. A botanical certificate was manimously awarded to Mr. Hyde for them. He also showed a hybrid raised between this species (male) and P. obconica female), in which the form of the umbel, as as well as that of the leaf, more resembled those of P. obconica. The segments of the petals were that and not reflexed, and but shightly cusped. These differences, however, were not considered to be sufficiently pronounced to be regarded as well-defined intermediate characters, so that it was apparently a case of prepotency on the part of the female parent (P. obconica). Dr. Masters gave an interesting account of

the introduction of the wild plant into England. Dr. Henry first pointed it out to him at Kew among a collection of dried plants, which he had made in the mountains of Central China. Dr. Masters was thus enabled to recoguise it growing in the gardens of Appley Towers, Isle of Wight, the seed having been sent over by one of the family. Thence it passed into the hands of Messrs. Sutton, who have tried to cross it, but hitherto it has appeared to resist all attempts. Further particulars will be found recorded in the Gardwers' Chronicle, January 26 and November 23, 1889, November 15, 1899, and in Mr. A. W. Sutton's paper on Chinese Primulas, "Journal R. H. S.," 1891, vol. xiii., p. 99 (a Botanical Certificate was awarded).

Cotalpo bignonioides.—Dr. Bonavia exhibited specimens of these curiously winged seeds, but they did not appear to have been fertilised, as no embryo could be detected in them. The seed vessel, which is rarely seen in this country, is nearly one foot in length.

Conher in Apple Trees.—Dr. Masters exhibited specimens of this common disease, which has hitherto baffled investigations as to its source, but the examples shown bore numerous red fructifications of the fungus Nectria ditissima burnting through the bark.

Penus Bulfouriana car, aratata.—He also showed specimens of the cones of this Piue, which is a native of the alpine regions of Colorado. They were received from Mr. A. D. Webster. The shoots bearing the young cones bore short stout leaves, unlike those on a vegetative shoot, on which they were longer and more slender, though Dr. Masters observed that the anatomical peculiarity of having a single resin canal is the same in both. The scales of the ripe cone have the external bracts terminating it an awn-like tip, which doubtless suggested the variet al name.

Tomato Freets Diseased.—He also brought some fruits badly diseased. It appears I to be an advanced stage of the "yellow spotted" form; it was forwarded to Kew for investigation.

Her others front,—Dr. Masters also showed a fruiting branch of this Japanese spices of Holly.

Celexy D. cayed — Mr. Messenger of Woolverstone Gardens, lpswich, forwarded two large plants with the interior leaf-stalks much decayed. No fungi had been found in similar instances, and the general belief was that the plants had been earthed-up, and perhaps bound up too early, so that growth was bindered, and wet having penetrated produced the decay.

HORTICULTURAL CLUB.

DECEMBER 15.-The usual monthly dinner took place on the above date, when Mons. Henri de Villmorin, of Paris, was the special guest of the Club. The chair was occupied by Mr. Harry J. Velle H. Vice-Chairman of the Club, and there were present the Rev. W. Wilks, Messrs, Selfe Leonard, G. Bunyard, G. Paul, P. Kay, T. Francis Rivers, Philip Crowley, H. Turner, Junes H. Veitch, Peter Veitch, Ernest D'Ombrain, W. F. Cooling, C. T. Druery, A. H. Pearson, and the Secretary. The subject for discussion was the "Flora of Smyrna," and was opened by Mr. Charles T. Druery. who read a paper compiled from notes taken during a recent visit to Asia Minor. After giving a humorous description of Smyrua itself, some of the curious anomalies connected with the mixture of Turkish and foreign currency, and the method of time keeping, winding up with the remark that nothing could surprise the horticulturist after hearing that the import of artificial flowers was long vetoed for fear of the phyllogera, Mr. Druery proceeded to deal with the flora proper, which he described as rich in the extreme, a fact which he illustrated by quoting a most interesting list of Galanthus, Chionodoxa, and Tulips, compiled from Mr. Edward Whittall's herbaria and notes taken in his garden among the very plants themselves. An animated discussion followed, in which most of the members present took part, Mr. D'Ombrain describing the introduction of that now common gen the Chionodoxa Lucilia, which the horticultural world owes jointly to Mr. Whittall's first importation and Mr. D'Ombrain's appreciation of its value. One salient point seemed to be demonstrated, both by the paper and the succeeding remarks—viz., that the dry and baking hot summer conditions in the native habitat of many bulbs require to be borne in mind far more than is customary, a large number of failures resulting from the non-observance of this requirement borne of such environment. vote of thanks was accorded to Mr. Druery for his interesting and instructive paper.

Obituaro.

ROBERT WARNER.—There will be a general feeling of regret among the elder generation of horticulturists, and of orchidists in particular, at the death of this gentleman. He died at Widford Lodge, Chelmsford, on the 17th inst. in his eighty-second year. It is only a few months since we had occasion, to speak of his garden at Widford, and to recall some of his many services to horticulture (May 30, p. 683). His Cattleyas live in the memory of many, and we may recall his patriotic and plucky exhibit of a fine collec-

tion of Orchids taken by him in person to the great International Horticultural Exhibition at St. Petersburg in 1867. Mr. Warner was an active member of the Royal Horticultural Society, and foremost in works of charity and heneficence. Successive volumes of the Orchid Album, from the beginning till the present time, bear his name as one of the editors, and his work on Scleet Orchiduceous Plants is held in high extern

SAMUEL RANDALL.—On the 16th inst., at Exeter, occurred the death of Mr. S. Randall, a nurseryman of that city. Mr. Randall was engaged as foreman in the laying out of Victoria Park, London, an l for some time after its formation had the management of that park. Before entering business upon his own account, Mr. Randall was foreman in the firm of Lucombe, Pince & Co., and has been a member of the Devon and Exeter Gardener' Association since its formation.

THE REV. CHARLES FELLOWES .- The intelligence of the death of the Rev. Charles Fellowes of Shotesham Rectory, Norwich, on the 17th inst., at the ripe age of 81, will be received by florists generally with regret, but more especially by the members of the National Dahlia Society, he having fill the post of president for many years past. An old acquaintance designated him as "one of the most enthusiastic florists that ever lived;" and this eulogium will be generally endorsed in floricultural circles. A member of the family of Fellowes of -Shotesham Park, he became rector of the parish in 1838, and from the first evinced great interest in the culture, and especially in the raising of new florist's flowers. Dahlias and Picotecs in particular engaging his attention. One of his earliest productions was Dahlia Cassandra, sent out by the late Mr. Charles Turner in 1846, and from that time onwards he never ceased his work. Chief among the show sorts he raised are, Agnes. Canary, Diadem, Goldfinder, Maud Fellowes, Mrs. Morgan, Muriel, Perfection. Prince Bismarck, Prince of Denmark, Robina. Pleasaunce, Sunbeam, and Sunrise; and of fancy varieties, Hero, Laura Haslam, Prince Henry, and Sailor Prince. Dante and Marjorie, two new showvarieties sent out from Slough in the spring of the present year, were of his raising. The Picotee was his especial favourite, and among the earliest raised varieties, were Countess and Ganymede, catalogued forty years ago, and still grown as sterling varieties. A list of present day varieties of his raising would include nearly two dozen, among them heavy roseedged Mrs. Payne, sent out in 1878, which the late Mr. E. S. Dodwell describes as "a glorious variety, unsurpassable for the beauty of its form and petal, the brilliance of its bright rose marginal colour, and pure white ground." This is one of the chief among the many glorions flowers raised by Mr. Fellowes, and it is not too much to say it has received more first prizes as the best in its class, and more premier prizes than any other variety. Duchess of York, Clio, Princess of Wales, Morna, Dr. Abercrombie, Hardie, Gazelle, and Juliette, are deserving of special mention. The late rector of Shotesham was also a lover of laced Pinks, and at least two dozen named varieties can be counted, of which he was the producer. The Rector was one of his latest; and of other standard varieties, mention may be made of Favourite, Hebe. Jeanette, Enchantress, Lustre, Constance. Pandora, Minerva, Zoe, &c. The show Pelargonium also was cared for, but he did not prove so successful in introducing new varieties of these as of the flowers already named. The best of his productions were Ariel, Desdemona, Lucifer, &c., varieties of excellent repute in their day. The Rose also figured largely among the subjects grown in the rectory garden, and he possessed a very fine collection. As an exhibitor, he was extremely successful for years in the amateur's classes over such doughty champions as Dodds, Robinson, and others. In his younger days he was an excellent shot, and country sports found in him an enthusiastic supporter. Attached to the rectory was a good farm, which was admirably managed, and the crops he obtained wore considered second to none in the district. R. D.

MARKETS.

COVENT GARDEN, DECEMBER 23.

[We cannot accept any responsibility for the subjoined reports. They are furnished to ns regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. En.

POTATOS.

Trade this week very quiet, stocks heavy, and less money s being taken, except for very best samples. J. B. Thomas.

SEEDS.

LONDON: Dec. 23. - Messrs. John Shaw & Sons, Seed Merchants, of Great Maize Pond, Borough, London, S.E., write that Christmas being so close at hand, to-day's seed write that thristmas being so close at hand, to-day's seed market was quite idle. Meanwhile all varieties of Clover and Grass seeds keep steady in value. American Red is cabled strong. Mustard is firm There is some inquiry for large black Rape-seed. Peas and Haricots, owing to the cold weather, meet with in me attention. The new Californ'an Butter Beans proving good and cherp, are in improving request. There is no change in Bird-seeds. Linseed is firm.

FRUIT AND VEGETABLES.

The districts indicated by number in the first column are the following:—

0, Scotland N. Principal Wheat-producing Districts—
1, Scotland, E.: 2, England, N.E.: 3, England, E;
4, Midland Counties; 5, England, including London, 8. Principal Grazing, &c., Districts — 6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending December In, is furnished from the Meteorological Office:

"The weather continued mild and rainy during the first day or two of the period, but subsequently became cold, with slight falls of hail, sleet, or snow.

"The temperature was below the mean, the deficit ranging from 3° to 4° over 'Grêat Britain,' and from 4° to 6° in 'Ireland.' The highest of the maxima were recorded on the 13th, and ranged from 50° in the 'Channel Islands' to 44° in 'Scotland, N,' and the 'Midland Counties.' During the latter days of the period the maxima at the inhand and postborn sections did not exceed the treatment to make the maxima at the inhand and northern stations did not exceed the freezing point by much. The lowest of the minima, which occurred luring the latter half of the week, varied from 15° in 'England, S.W.,' and 16° in 'Ireland, N.,' to 27° in 'England, N.W.,' and to 33° in the 'Channel Islands.'

"The rainfull varied greatly in different parts of the kingdom—It exceeded the mean in the 'Channel Islands, and 'England, S.W. and S.,' as well as in 'England, N.E.;' in 'Scotland, E.,' it just equalled the mean, but was less than the normal in the other districts. In 'Scotland, W.,' the faces extraording light. was extremely slight.

"The bright snashing was much more prevalent than during "The bright suashior was much more prevalent than during the preceding week, and exceeded the mean in all the 'grazing districts,' as well as in 'Scotland, N,' and 'England, N,E.' The percentage of the possible amount of duration ranged from 30 in 'Ireland, N,'..5 in 'Ireland, S.,' of in 'Scotland, W.,' and 30 in 'England, N,E.' to 11 in 'England, S.,' and to 13 in 'Scotland, E.'

"Earthquike shocks were experienced in many parts of England and Wales at about 5.40 a.m. on the 17th, but were more decided in the western and central counties than

,* Owing to the severe pressure on our space, the publication of a large amount of correspondence is unavoidably postponed.

ABRUS PRECATORIUS: Letellier et Fils. The plant is a native of India, but it is now cultivated in some of the West Indian Islands and Mauritius. You might obtain seeds in this country of Mr. W. Thompson, Tavern Street, Ipswich, Vilnorin of Paris, or through traders to the Mauritius, &c.

ADVERTISING FOR A SINGLE-HANDED GARDENER'S SITUATION: W. Marshall. Why, certainly! in the Gardeners' Chronicle.

BODKS: P. Hansen. The book that you mention is the best of the kind: and a new edition, in which all matters will be brought up to date, will shortly be issued by Messrs. Blackie, Glasgow and London.

CARNATION BLOOMS: G. E. The blooms show no sign of disease whatever. A whole plant should have been sent.

CHEAP ARTIFICIAL MANURES: J. McL. See our issue for June 6, 1896. It is not by Dr. Voelcker, but by Mr. Dutton.

Correction. - The Wantage collection of fruit shown at the last meeting of the Royal Horticultural Society received a Knightian, and not a Banksian Medal, as was stated in our report.

CYCLAMENS DWINDLING AWAY : G. Watts. bad case of eel-worms infesting and living on the roots. Nothing can be done with them, and it would be prudent to burn the whole of them. Before using any pasture loam, examine the living roots of the grasses and other plants therein, and if nodules similar to those seen on the roots of the Cyclamens sent to us exist, do not make use of it for potted plants. It may be here stated that it is always advisable to stack loam cut from grass-land for one or two years, and prevent herbage growing on the top and sides of the stacks during that tune. By doing this the eel-worms deprived of their food, die out. The evil lies in using fresh loam, or loam from heaps over-run with vegetation.

INSECT: W. S. The larva of the stag-beetle Lucanus cervus. R. McL.

NAMES OF FRUITS: F. Y. 1, Cox's Orange; 2,
Adams' Pearmain: 3, so much bruised, cannot be determined. — T. 8.
1. Wyken Pippin; 2, Cornish Aromatic; 3, Tower of Glams; 5, Duche-so de Bordeaux; 6, Vicar of Winkfield.

NAMES OF PLANTS: T. B. The plant supposed to be an Ivy-leaved Pelargonium is Mikania ternifolia.—
G. W. E. What you send is the fruiting leaf of some

species of Cycas; we cannot tell which without species of Cycas; we cannot tell which without the leaf. The plant is discious, so that the seeds will not grow unless they have been fertilised by the pollen from another plant— θ . If. C. I, Araucaria excelsa; 2, Begonia argyrostigma; 3, Agapanthus variegatus; 4, Swain-onia galegaefolia, probably, but you send no flowers; 5, Dracouna rubra; 6, Lasiandra macrantha.—J. B. Co-logue fuscescens.—S. S. The flower sent is certainly one of odentogle. sum Wilckeanum, but it does not well represent that variety. - R. N. H. 1. Oncidium reflexum: 2, is an extraordinarily fine flower, probably a natural hybrid. In fact, a fine form of Oncidium Mantini.

PACKING CUTTINGS AND PLANTS FOR TRANSIT TO Assam.—If R. O, will kindly send his name and address, we will furnish him with those of a person experienced in these matters.

SEEDLING CARNATION: O. W. G. We think well of your seedling, it is of a deep rose, shading to white, fagrant, and the ealyx does not split.

SOIL FOR CHUMBER CULTURE: P. H. That which is taken from an old pasture will be better than that from an orchard. It should be partially decayed, and mixed with manure at the rate of a quarter of the latter when prepared for use in the Cucumber-beds; see answer to G. Watts.

TACSONIA VAN VOLNEMI NOT FLOWERING: W. Marshall. Winter not being the proper season of flowering of this plant is a reason why it flowers when they are forced to appear, are imperfect, and otherwise defective. The plant should be at rest at this se ison.

WRONGELL DISMISSAL: T. G. There is no other case in recent years which resembles the one about which you enquire. The publisher is unable to supply copies farther back than the year 1888.

14	"	 0	8	0	25	"	• •	0	13	6

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set agrees two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

Advertisements guaranteed to appear on the front page are charged at the rate of is, per line, head line counting as two lines. No display is allowed.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertise-ments must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS .- In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmurk on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. COVE, as, unless the number of a Postal Order is known, and it is the number of such as a particular, office. it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.
